Wanted——

a man to represent in his home-territory and in his spare time, the world's largest cream separator manufacturer

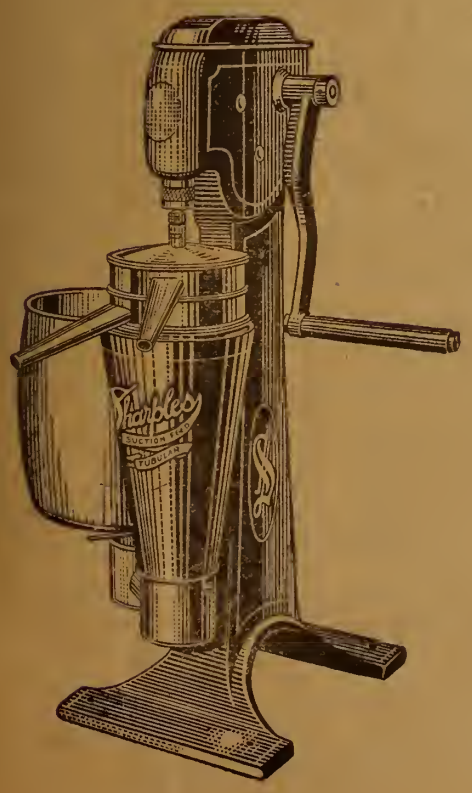
The Sharples Separator Company, the world's largest manufacturers of Cream Separators, Emulsifiers, Clarifiers, Whey Separators and Factory Separators, is about to enlarge its selling force.

The success of Sharples representatives in the territories that are now covered. insures an excellent opportunity in the new field for the right man.

The man we want is a capable successful farmer—who knows his neighbors and whose judgment is respected by them. If he is a Sharples owner so much the better.

He may devote to his work for us as much or as little of his time as he may elect. His territory will be his own.

He will find that the Sharples Suction-feed Separator has convincing and demonstrable selling points (skims clean at any speed, knee-low supply tank, no discs to wash, less than $2 a year guaranteed for oil repairs, etc.), that are not even **claimed** for any other separator.



He will find a host of Sharples users who will be glad to offer proof of Sharples' superiority in actual usage.

He will find that farmers already know of Sharples Separators through our extensive national advertising.

We want such a man in your territory. You can make this opportunity mean much to you if you will. Write today for exclusive contract and prices.

CO-OPERATIVE SHIPPING OF LIVE STOCK

The system of marketing live stock is building up the live stock industry of the country more than any other factor.

The farmers through this system are getting interested in better sires, are putting a better finish on their animals and are rapidly increasing live stock production. Minnesota has nearly 500 co-operative shipping associations and Iowa has about 360. The first association was formed at Litchfield, Minnesota, in 1908. It has grown like a weed and in 1918 it did over $552,000 worth of business.

BUILDS AND BINDS A NATION

Truly national in character is the exhibit of the Canadian National Railways in the Railway Building at the Canadian National Exhibition, Toronto. The ensemble is most striking, and the electric lighting of the dome, combined with most artistic draperies, lends a spacious character to the whole exhibit, while the arrangement of the display in general permits of freedom of movement to view the various exhibits in detail.

The frieze decorations show typical landscape views of the nine Provinces with coat of arms of each, the connecting link bearing the highly significant reminder that this is an exhibit of "a line that builds a nation."

Three sides of the octognal building are occupied by a huge topographical map of the Dominion, on which are shown in briliant illumination the names of the principal points reached by the Canadian National Railways, "the great stell strand that threads the land" being indicated by a broad band of red.

No better or more comprehensive plan could have been adopted to demonstrate that 14,000 miles of railway are now under Canadian National management, and that the Canadian Northern, the Intercolonial and Transcontinental railways have been amalgamated into one vast system. To further demonstrate the fact that the system traverses every Province of the Dominion and reaches every Provincial capital, the observer by an ingenious arrangement of lights, is taken in fancy right across the continent from Hailfax to Vancouver and Victoria, stopping momentarily at the principal points enroute and then brou[illegible]ack again. The map should prove [illegible] much educational value in telling just what the Canadian National Railways are and the territory they reach.

Beautiful Transparencies

A rustic centrepiece and several rustic lanterns contain some really beautiful photographic transparencies which do not fail to call attention to Canada's innumerable scenic gems, while the hunter's log cabin with its sporting trophies is also utilized for the projection of dissolving views and moving pictures of scenic and sporting industrial life.

Forestry, pulp and paper, minerals, Indian trophies and agricultural features complete an exhibit on which there has evidently been much careful preparation and considerable forethought Nor has the royal visit been forgotten, for on top of the pyramid devoted to a beautiful display of British Columbian fruit stands the Prince of Wales' crest, the three feathers worked in grain with the motto, "Ich Dien." Altogether it is an exhibit which every visitor should see if he would learn of Canada's national system of transportation.

The true farmer is not the man who farms just because he thinks he can make more money than he can at other business, but the man whose heart is in his work, and has enough true feeling in that same heart to take care of and see that everything on the farm is getting its proper attention and is comfortable, well fed, and well sheltered.

"It wears longer"
"Stands Strenuous Wear"
STANFIELD'S
Unshrinkable
UNDERWEAR
STANFIELD'S Unshrinkable Underwear is an absolute necessity during the long winter. It is health protection—knitted by those who know the underwear needs of our Canadian climate — and made unshrinkable by Stanfield's exclusive process. All good dealers sell Stanfield's.
Made in Combinations and Two-Piece Suits, in full length, knee and elbow length, and sleeveless, for Men and Women.
Stanfield's Adjustable Combinations and Sleepers for growing Children. (Patented).
Sample Book, showing different weights and textures, mailed free—Write.

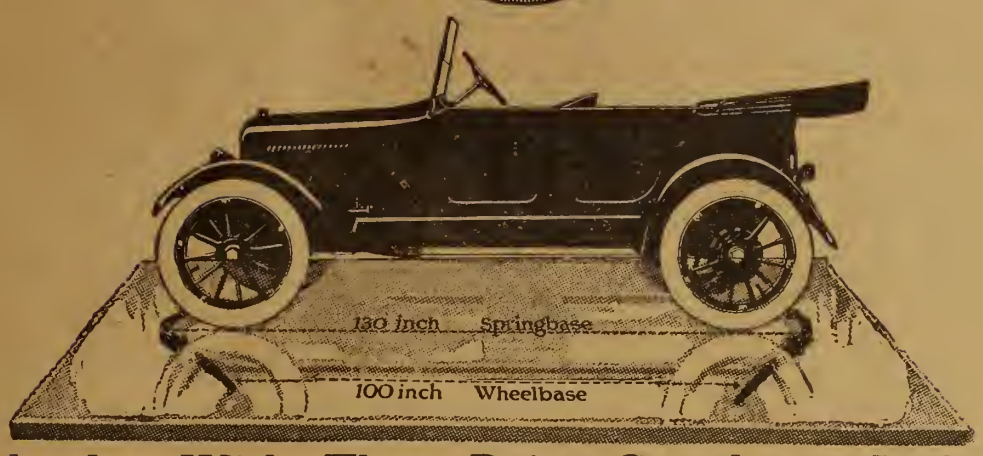
Overland

TRADE MARK REG.



The New Overland 4 With Three-Point Cantilever Springs, the Greatest Improvement in Riding Comfort Since Pneumatic Tires

THIS new Overland 4 has a spring-base of 130 inches—yet its wheel-base is only 100 inches.

It is a brand new type of car with an entirely new standard of riding comfort.

The springs are Three-Point Cantilever Springs of Chrome Vanadium steel, a new type of spring exclusive with this new Overland.

They give the Overland 4, with its light weight and ease of driving, the riding-comfort and road-steadiness formerly confined to heavy, expensive cars of long wheelbase.

They end bouncing and vibrating over the bumps. They stop the usual swaying, twisting and jars that fatigue the passengers and rack the car!

The wheels and springs go up and down, following the bumps, but the passengers and car are shielded from the blows of the road. The Three-Point Springs protect the mechanism from road injuries and prolong the life of the car.

Light weight brings great economy of tires and gasoline.

High quality materials and workmanship are used in Overland 4 throughout. Its equipment is like that of expensive cars, complete from Auto-Lite Starting and Lighting to its Demountable Rims.

Ask the Overland dealer to show you this new motor car which has been tested more than 250,000 miles, let him explain to you its exclusive Three-Point Cantilever Springs, then—

Select rough roads that you formerly dreaded to ride over and see what it means to ride in Overland 4.

Overland 4 Touring, $1195; Roadster, $1195; Coupe, $1845; Sedan, $1995—f. o. b. Factory, Toronto, War Tax included

Every Young Farmer in the Maritime Provinces

SHOULD WRITE TO TRURO FOR A

FREE Copy of the Calendar of Agricultural College, Truro, N. S.

The College opens Nov. 4th next. Tuition is Free

A complete course is offered in all branches of Agriculture and the related sciences as well as English, Mathematics, etc.

An ordinary school education, plus farm experience qualifies for entrance. The age of former students varies from 16 to 35.

The course lasts two years at the conclusion of which students are awarded the Associate Diploma of the College. Graduates may complete their B.S.A. course at Guelph or MacDonald Colleges. Previous graduates have from year to year stood at the head of their classes at these institutions.

For further information write

What it Costs You to Do Without a Renfrew

SELLING butter-fat at now-a-day's prices is like selling gold out of a mine on your farm. Imagine the owner of rich gold quartz extracting the gold with a machine chosen for its cheapness! One man chose an ordinary cream separator for its low price. Pretty soon the bowl wobbled, gears rattled. The women complained about the high supply tank, the toilsome cleaning and the hard running. Inside of two or three years that man was convinced of the folly of "saving" money on a cheap separator.

Save yourself this costly experience by investigating the

Renfrew
CREAM SEPARATOR

First step is to find out what your present separator is really doing for you. Just send a sample of your skimmed milk to any government dairy school for a Babcock test. We gladly welcome this "skim-the-skim-milk" test.

When you get the result compare it with the Renfrew record; the Renfrew

Gets 99.99% of the Butter Fat
(Results Confirmed by Dairy Schools' Tests)

We know by experience that you will more than likely discover a costly leak in your butter fat profits with your old machine.

Take your pencil and figure the loss on your herd for a year. Won't it pay you to know what it *costs* you to do *without* a Renfrew?

And what does it cost you if you want to increase your herd considerably to replace an ordinary separator—or to stand the losses of an overtaxed machine? The Renfrew's exclusive interchangeable capacity feature gives you the full and complete advantage of a new machine by simply changing the bowl and fittings.

Write for our new folder, the "Big Five," and get full details of our exclusive wide open bowl, self oiling system, convincing endurance features, easy running, low supply tank, etc., etc. Send the postal card to-day.

THE MARITIME FARMER

AND

CO-OPERATIVE DAIRYMAN

REGISTESED TRADE MARK

Official Organ of The Farmers' and Dairymen's Association of New Brunswick, The Nova Scotia Farmers' Association, The Nova Scotia, New Brunswick and P. E. Island Fruit Growers' Associations, The Maritime Stock Breeders' Association, The Maritime Bee-Keepers' Association and The Newfoundland Agricultural Board.

Volume 25. SUSSEX, NEW BRUNSWICK, OCTOBER 14, 1919. Number 1.

The Charlottetown Exhibition

Encouraged by monetary grants from the Dominion Live Stock Division, the Government of Prince Edward Island, the Charlottetown City Council and several of the merchants of Charlottetown, the Prince Edward Island Agricultural and Industrial Exhibition was held under the auspices of The Charlottetown Driving Park and Provincial Exhibition Association on September 23rd to 26th, with competition open to all Canada.

Over $8000.00 was offered in prizes, yet the response in the way of exhibits was not as extensive as it might have been. The showing made by the stock breeders, agriculturists and cheese factories and creameries was not anywhere near the Island's possibilities in these lines. When the rank and file of the farmers of Prince Edward Island will show enough interest in their fair to bring of their best, they will put up a showing that not only the native Islander, but also the stranger within her gates, will be proud to extol. This years showing was not in keeping with the efforts put up by Secretary Smallwood and his efficient staff of assistants. Nor was it fair to the Island province were the visitor to judge the agricultural possibilities of the Garden of the Gulf by what he saw at the Exhbition.

The Island farmers are not, however, to be censured too heavily for this year's small showing. As we looked out of the railway cars windows and saw thousands of acres of grain in stook in the fields, we conceded before reaching Charlottetown that the showing would be on the light side. Excessively wet weather had interfered with the completion of the housing of a bountiful grain harvest and consequently only those who had completed this important task or who had an abundance of farm help were justified in contributing any time to exhibits..

Then several of the Island's best flocks of sheep and Horne Bros.' Aberdeen Angus show herds were at Chatham Exhibition completing their circuit of the Maritime mainland shows, where they very materially helped to draw attention to some of the good things produced by the Island Province.

The Judges

The judges were:—

Heavy horses—Adam Scarff; Light horses, D. J. Greig.

Dairy Cattle—Neil Sangster.

Beef Cattle and Sheep—J. M. Guardhouse.

Swine—P. J. McEwen.

Poultry—W. H. Reid.

Agricultural Products—S. J. Moore.

Dairy Produce—W. A. McKay.

Horticulture—Prof. P. J. Shaw.

In the Main Building

In the main building the agricultural products display was not up to the standard in point of quantity. In fact it was the smallest display of field and garden produce that we have seen at Charlottetown during the past decade.

The showing in horticultural lines was fairly extensive. The apples were clean, well grown and well colored. H. E. Bent of Tupperville, N. S., had entries in many sections and captured the first prize for best collection of apples, S. R. Lane, Southport and Jas. Essery, Union Road coming in for second and third monies.

There was a good display of butter in the various sections of its class, with quality well maintained in the nineties from the judge's score standpoint, as will be seen in the published list of prize winners.

The cheese exhibit occupied its customary section. Hamilton, Hillsboro, Park Corner, Summerside, Gowan Brae, Murray Harbor, Kinkora, Grand River, Stanley Bridge, Tignish, New Glasgow, Kensington, Alberton and Cornwall cheese factories had specimens of their June, July and August cheese, while conspicuous by their absence were Wiltshire, Emerald, Dundas, Red House, New Perth, Hazelbrook, Vernon River, Lot 16, Souris East, Tyne Valley ,Orville and Egmont Bay. New Glasgow factory captured first money with an average score of 95.53 points out of a possible 100 points.

The ladies fancy and domestic exhibits as usual reflected a lot of commendable credit on the good women of the Island province.

The booths of a number of the mercantile firms of Charlottetown were tastily arranged and decorated. The manual training, as well as the Domestic Science exhibits of work done in the schools of Charlottetown, showed excellent work on the part of both teachers and pupils.

The Canadian National Railways Exhibit showing maps of the system and some of the many scenic points of interest along its routes, was admired by throngs of visitors.

Another display that created considerable interest was the exhibit of Rock and Crushed salt from the salt mines recently—discovered at Malagash, Nova Scotia, which are being developed by Messrs. Chambers & McKay of New Glasgow, who also had asmples of ground limestone from their mill, a product that is destined to have a large sale in the Island province.

Automobiles, and farm machinery of various kinds, including tractors and electric lighting plants, filled machinery hall to the overflow point.

The Horses

The showing made in the horse classes was not at all extensive, although some exceptionally good individuals were paraded before the judges.

Standard Breds—Exposer, owned by H. C. Jewett, Fredericton, one of the speedy kind, carried off the first prize in the Aged Standard Bred stallion class, five up. There was only one entry in each of the three year old and two year old sections of this class the latter, the two-year-old Saxon Aubrey, by Cap Aubrey, shown by Geo. Callbeck of Summerside, carrying off the coveted diploma for best stallion under three years. Callbeck's Golden Aubrey by Cap Aubrey, performed a similar stunt in the female section of the Standard Bred class.

Percherons.—H. C. Jewett's four-year-old and three-year-old stallions led their respective sections, but the Percheron championship Diploma went to Alex. R. McKay's one-year-old stallion.

Clydesdales—The Clydesdale showing did not begin to compare with that of some previous years. The only section where there was any excitement was the Aged Stallion Class, where there were six up. Roper Bros.' Thorndale by High Honor, headed the list and won the championship diploma. H. C. Jewett's Dr. McCoy and W. H. Godfrey's Baron Rossiter came in for the blue and white ribbons respectively. Godfrey's horse was first with two of his get. W. W. Crosby had the champion female.

The heavy draft classes were keenly contested. The general purpose classes were poorly filled, excepting the section for mares or geldings, four-year-old, where eight good useful horses were presented for judgment.

The showing in the carriage and roadster classes was fairly strong, with not a few good individuals in the ring.

In the Beef Cattle classes J. M. Laird & Son's Shorthorns carried off the major portion of the most coveted prizes. Samuel Lane, Wallace Stead, S. L. Boswall, H. L. Boswall, Geo. Agney, Wellock and Clark and A. McRae & Sons were the other prize winning exhibitors in the pure bred Shorthorn classes.

G. T. Hayden's white faces had no competition. Only one Aberdeen Angus cow put in an appearance.

The grade classes were well filled and keenly contested.

Dairy Cattle

The big feature of the dairy classes was the Ayrshire showing, notwithstanding that several of the oldest established herds were not shown. There was no section of the show that received so much creditable comment and deservingly so as did the Ayrshire cattle class. This good showing is due to the efforts of the newly formed Prince Edward Island Ayrshire Breeders' Club. This progressive organization was formed last spring and has a membership of about fifteen Ayrshire breeders in the vicinity of Charlottetown with Bert R. Brown of York as their president and Major McRae of Royalty as Secretary. The members have pledged themselves to test regularly for the detection of tuberculosis, to keep official records of the performance of the females of their herds, to fit and make the best showing possible at the provincial exhibition and to sell no inferior animals for breeding purposes. They had the two barns in which their stock was housed thoroughly cleaned and whitewashed. A neat sign showed that this was the Club exhibit and it was pleasing to note how some of the old timers in trimming for the show ring, helped those who are new in the game. Ayrshire boost cards were prominently displayed and one breeder had the records of his females over each stall, as well as a productive extended pedigree of his herd from its foundation up to the present time. The gentleman we refer to is Mr. Bert R. Brown, the president of the Club, who is developing a splendid herd of cows with man-size teats and well developed udders. His Queen's Own by Howies Crusader, shown in the aged cow class was the champion female while the champion one-year-old heifer was Brightside Bessie, that captured the Bank of Commerce Silver Medal.

A. McRae & Sons are again back in the show ring with a small herd and will soon be going as strong as ever, production being now as heretofore their watchword. Their champion bull was Capt. Kidd.

Mr. Brown showed the best four animals, get of one sire, with the get of Fairview Milkman 2nd. The progeny of Mr. Brown's Princess led their class. Following is Queen's Owns record of production as shown on the placard over her stall:—

Calved	lbs. Milk	lbs. Fat	Test	Day
Jan. 6, 1918	12,523	543	4.32	390
Feb. 7, 1915	9,327	423	4.54	414
Jan. 17, 1916	12,521	584	4.62	471
April 23, 1919	8,260			152

Several other breeders whose names appear on the list of prize-winners elsewhere in this issue have some splendid young stock coming on and with the guidance of some of the older hands will be heard from later.

There was also a fairly good showing of Holsteins. Owing to stress of work along other lines, Hon. W. M. Lea, Prince Edward Island's new Minister for Agriculture, and one of Canada's most enthusiastic Holstein breeder's, he was unable to show his herd this year. There was keen competition between the herds of W. J. Gibson & Son, Godfrey & Son, H. J. Kennedy, C. E. McKenzie and several other breeders, all of whom are enthusiastic over the black and whites, and who have some excellent foundation stock.

Godfrey & Son's aged bull, Sir Rooker McDonald led his class and carried off the male championship. The female championship went to Elizabeth Kirk Abbekirk, a two-year-old heifer shown by H. J. Kennedy.

Gibson & Son had the best four calves get of one sire, Cobequid Helbon champion, and the best two progeny of their cow, Nellie Rooker Posch.

C. E. McKenzie's senior bull calf, Tortilla Korndyke Vale by Mercena Vale of Victoria, whose record stands at 16,000 pounds milk in one year, is a promising youngster that will make some of the good ones step lively

533829

some day.

Alex. R. McKay, Wallace Stead, Stephen Holroyd, Wedlock & Clark showed some useful looking Jerseys, while the Guernsey cow was as usual ably presented by Roper Bros.

There was a good showing of grade dairy cattle.

Swine

The veteran Berkshire swine, breeder, Peter Brodie, is open for congratulations on the acquisition of the letters M. L. A., which the electors of his county conferred on him at the last P. E. I. election. Peter is still in the ring with his splendid Berks and as usual carried off the lion's share of the prizes. Samuel C. Lane was also out with several good ones.

There was a fairly good showing of Yorkshires with Wallace Stead, Geo. Crockett, Stephen Holroyd, Jas. F. Roper and Robert Stewart out with their best and all getting a share of the awards.

There was also a nice little showing of Chesters, Wallace Stead, Farmers' Milling Co., Stephen Holroyd and A. H. Boswall participating in the winnings.

The competition in export bacon hogs was quite keen.

Sheep

The sheep classes missed the flocks absent at Charlottetown, but showing at Chatham, but there was enough competition to make matters interesting. The Boswall's, S. C. Stewart & Son, Samuel Lane, John Tweedy, Harry Tweedy, Farmers' Milling Company, Ernest Lund, Oliver and E. Saunders, J. M. Laird & Son, A. P. Horne, J. P. Horne, Cephas Nunn, Lorne Nunn, C. D. McLean, all in the winning with their respective breeds and flocks.

The Poultry

The poultry show, as will be seen by the published list of prize winners, was not up to the standard of other years in point of numbers, but the quality throughout was good.

The exhibits of the local and federal poultry divisions were closely inspected and the officials in charge were kept quite busy explaining matters dealing with poultry culture.

Th edisplay of the products of the Charlottetown Experiment Station was most creditable, and the trite morsels of advice re up-to-the-minute farm practices were jotted down in the memories of large numbers of visitors who loitered to get all the information they could get from the exhibit and its precepts.

Let every Island farmer plan now to make the 1920 Island Exhibition the biggest and best in the history of The Garden of the Gulf, and give the thousands of Islanders and visitors from the mainland something to talk about when they return to their homes. The Maritime Farmer feels that this is the earnest desire of the Island Department of Agriculture and of the men who are responsible for the Charlottetown Exhibition.

PRIZE WINNERS AT CHARLOTTETOWN

HORSES

Standard Bred Horses

Stallion, 4 yrs. and upwards in harness—1, H. C. Jewett, Fredericton, N. B.; 2, G. C. Redding, Sydney, N. S.; 3, J. H. G. Murphy, Charlottetown.

Stallion, 3 yrs. in harness—1, Joseph Power, Charlottetown.

Stallion, 2 yrs., in harness—1, Geo. Callbeck, Summerside.

Filly, 3 yrs. and upwards—1, W. S. McKee; 2, Geo. Callbeck; 3, D. W. White, York Point.

Filly, 2 yrs.—1, Wm. Bateman, Charlottetown; 2, Ernest Crabbe, North Wiltshire.

Filly, 1 yr., Prize offered by Canadian Standard Bred Horse Society—1, D. Robertson, North River.

Best Stallion, 3 yrs. or under—1, Geo. Callbeck.

Best Mare, 3 yrs. or under—1, Geo. Callbeck.

Saddle Horses

Gentleman's Saddle Horse, Gelding or Mare—1, G. Hughes, Charlottetown; 2, McDonald & Wood.

Lady's Saddle Horse, Gelding or Mare—J. E. O'Donnell, Charlottetown.

Percherons

Stallion, 4 yrs. and upwards—1, H. C. Jewett; 2, David Reid & Son, Montague.

Stallion, 3 yrs.—1, H. C. Jewett.

Stallion, 1 yr.—1, Alex. R. McKay, Charlottetown.

Filly, 3 yrs.—1, Alex. R. McKay.

Foal of 1919—1, Alex. R. McKay.

Mare with foal at foot—1, Alex. R. McKay.

Champion stallion, any age—1, Alex. R. McKay.

Draft Horses

Filly, 2 yrs.—1, John Cummings, North River; 2, John Connelly, Royalty; 3, D. W. White.

Foal of 1919—1, Stephen Ackland, Hampshire; 2, Samuel Auld, Clyde River; 3, John Cummings.

Mare with foal at foot—1, John Cummings; 2, Stephen Aikland; 3, Samuel Auld.

Pair Draft Horses, not less than 1400 lbs., shown in harness to a truck waggon—1, McDonald & Wood; 2, John Connelly.

Draft Mare or Gelding—1, Gordon Newson, North River; 2, McDonald & Wood.

Clydesdales, Registered

Stallion, 4 yrs., and upwards—1, Roper Bros., Charlottetown; 2, H. C. Jewett, Fredericton, N. B.; 3, W. H. Godfrey, Marshfield.

Stallion, 1 yr.—1, A. H. Boswall, Little York; 2, W. W. Crosby, Cornwall.

Filly, 3 yrs.—1, W. W. Crosby.

Filly, 2 yrs.—1, J. R. Munn, Marshfield.

Foal of 1919—1, B. Younker, North River; 2, W. H. Godfrey, Marshfield.

Mare with foal at foot—1, B. Younker; 2. W. H. Godfrey.

Champion stallion, any age—Roper Bros., Charlottetown.

Champion Mare, any age—W. W. Crosby, Cornwall.

Stallion and 2 of his get—W. H Godfrey, Marshfield.

Special Prizes given by Clydesdale Horse Association of Canada

Best Clydesdale Stallion, imported or Canadian Bred—1, Jas. Roper.

Best Clydesdale, female, imported or Canadian Bred—1, W. W. Crosby.

Best single grade Mare or Gelding in harness, sired by a registered Clydesdale stallion—1 and 2, John S. Connolly, Royalty.

Best pr. grade Mares in harness, sired by registered Clydesdale stallion—1, McDonald & Wood; 2, John S. Connelly.

Carriage Horses

Stallion, 4 yrs. old and upwards—1, David Reed & Son, Montague.

Filly, 3 yrs. old—John Rooney, Orwell Cove.

Filly, 2 yrs. old—1, Matthew Maher, Charlottetown; 2, Millan McDonald, St. Avards.

Filly, 1 yr.—1, Neil Shaw, De Sable; 2, John J. Crabbe, North Wiltshire; 3, F. Moreside, North Rustico.

Foal 1919—1, B. H. Newson, North River; 2, Byrne Bros., North River; 3, W. S. McKee, Charlottetown.

Carriage Mare or Gelding, shown in carriage—1, W. F. Robbins, Charlottetown; 2, Stephen Holroyd, Winsloe; 3, Geo. Agnew, Royalty.

Carriage Mare or Gelding, shown in carriage.—1, A. A. McBath, Marshfield; 2, W. S. McKee, Charlottetown; 3, Harry B. Clark, Victoria.

Champion Mare, any age—1, Matthew Maher, Charlottetown.

For Dealers Only

Pr. horses, Geldings or Mares, one each shown in carriage—1, Horne Bros.; 2, McDonald & Wood.

General Purpose

Mare or Gelding, 4 years old—1, Neil Shaw, DeSable; 2, McDonald & Wood, Charlottetown; 3, H. H. Roberts, Royalty.

Mare or Gelding, 3 years old—1, S. C. Stewart & Son.

Matched Team—1, McDonald & Wood; 2, Wallace Stead.

Walking Horses

Mare or Gelding—1, John Cumming, North River; 2, Stephen Ackland, Hampshire; 3, B. Yorker, North River.

Roadsters

Mare or Gelding, 4 years old—1, Geo. Nuthart, Summerside; 2, John Rooney, Orwell Cove; 3, A. A. McBeath, Marshfield.

Filly or Gelding, 3 years old—1, Clara McMillan; 2, S. H. Newson.

Brood mare with foal—1, Geo. Agnew; 2, Byrne Bros.; 3, B. H. Newsome.

Mare or Gelding shown in carriage—1, A. A. McBeath; 2, C. M. Dickson, Charlottetown; 3, Byrne Bros.

Walking Horses—1, Byrne Bros.; 2, G. Newsome; 3, McDonald & Wood.

Single Pony—1, Alex. R. McKay.

BEEF CATTLE

Shorthorns

Bull, 3 years old—1, J. M. Laird & Son, Kelvin Grove; 2, Samuel Lane, Mt. Mellick.

Bull, 1 year old—1, Wallace Stead, Highleld; 2, S. L. Boswall, Pownal; 3, J. M. Laird & Son; 4, H. L. Boswall, Little York.

Bull, senior calf—1, J. M. Laird & Son; 2, A. H. Boswall.

Bull, junior calf,—1, J. M. Laird & Son; 2, Geo. Agnew, Royalty.

Cow, 3 years old—1 and 2, J. M. Laird & Son; 3, Wedlock & Clark, Union Road.

Dual purpose cow, over 3 years—1 and 2, J. M. Laird & Son; 3, Wallace Stead.

Dual purpose cow, under 3 years—1, J. M. Laird & Son.

Cow, 2 years old—1 and 3, Wedlock & Clark; 2, J. M. Laird & Son.

Heifer, 1 year old—1 and 2, J. M. Laird & Son; 3, Wedlock & Clark.

Heifer, senior calf—1 and 3, J. M. Laird & Son; 2, S. L. Boswall.

Heifer, junior calf—1, J. M. Laird & Son; 2, S. L. Boswall; 3, A. McRae & Son.

Champion Bull—J. M. Laird & Son.

Champion Female—J. M. Laird & Son.

Herd, aged—1, J. M. Laird & Son.

Breeders' young herd—1 and 2, J. M. Laird & Son.

Bull and 3 of his get—1, Samuel Lane.

Cow and 2 of her offspring—1 and 2, J. M. Laird & Son.

Best 4 animals, offspring of one cow bred and owned by exhibitor—1 and 2, J. M. Laird & Son.

Two animals, progeny of one cow—1 and 2, J. M. Laird & Son.

Heresfords

All prizes awarded in this class went to G. T. Hayden, Cherry Valley, without competition.

Abereden Angus

Cow in milk or calf, 4 years old—1, Horne Bros., Winsloe, P. E. I.

Grade Beef Cattle

Cow, 4 years old—1, J. M. Laird & Son; 2, S. L. Boswall; 3, Joseph Praught; 4, Wallace Stead.

Cow, 3 years old—1, J. M. Laird & Son; 2, Joseph Praught.

Heifer, 2 years old—1, J. M. Laird & Son; 2, Joseph Praught.

Heifer, 1 year old—1, Joseph Praught; 2, J. M. Laird & Son; 3, H. L. Boswall.

Heifer, senior calf—1, Joseph Praught; 2, Steve Holroyd; 3, Wallace Stead.

Heifer, junior calf—1, G. L. Hayden; 2, Wallace Stead.

Steers

Fat animal, 2 years old—1, Joseph Praught.

Fat animal, 1 year old—1, Joseph Praught.

Best pair of steer calves—1, Samuel Lane.

DAIRY CATTLE

Ayrshire

Bull, 3 years old—1, A. McRae & Sons, Charlottetown; 2, Bert R. Brown, York; 3, Farmers' Milling Co., Mt. Hebron.

Bull, 2 years old—1, Edwin Reid, Rollo Bay.

Bull, 1 year old—1 and 3, C. F. Ferguson, York; 2, J. H. Love, Charlottetown.

Bull, senior calf—1, W. R. Yonker, Charlottetown; 2, A. McRae & Sons; 3, C. H. Robertson, Marshfield.

Bull, junior yearling—1, A. McRae & Sons; 2, Bert R. Brown.

Cow, 4 years old—1, Bert R. Brown; 2, C. H. Robertson; 3, W. R. Yonker.

Dry Cow, 4 years old—1, Bert R. Brown; 2, A. McRae & Sons; 3, Farmers' Milling Co.

Cow, two years old—1, A. McRae & Sons; 2, C. T. Ferguson; 3, Ambrose Rodd, Milton.

Heifer, 1 yr.—1 and 2, Bert R. Brown, York; 3, W. R. Yonker, Charlottetown.

Heifer calf, under 1 yr., over 6 mos.—1, Edwin Reid, Rollo; 2, A. McRae, Charlottetown; 3, Bert R. Brown.

Heifer, under 6 mos., over 3 mos.—1, Edwin Reid; 2, A. McRae & Sons; 3, Farmers Milling Co.

Aged Herd—1, A. McRae & Sons; 2, Bert R. Brown.

Breeders Young Herd—1, Bert R. Brown; 2, C. T. Ferguson, York; 3, Farmers' Milling Co.

Champion Bull—A. McRae & Sons.

Champion Female—Bert R. Brown.

Best pen 2 hogs, any cross or grade for export bacon—1, H. C. Stewart & Son; 2, Geo. Crockett; 3, Joseph Praught, Cherry Valley; 4, S. C. Stewart & Son.

Messrs. Davies & Fraser, Halifax, special prize for 2 best finished hogs any breed, not weighing over 125 lbs. when dressed, property of one exhibitor—1, Joseph Praught; 2, Edison Reid, Robb Bay; 3, Robert Stewart; 4, H. C. Stewart & Son.

SHEEP

Leicesters

Ram, 2 shears and over (2)—1, S. L. Boswell, Pownal;2, S. C. Stewart & Son, Dunstaffnage.

Ram, shearling (4)—1, S .C. Stewart & Son; 2 and 3, Samuel Lane, Mt. Mellick.

Ram Lamb, (4)—1, 2 and 3, S. C. Stewart & Son.

Ewe, shearling (4)—1 and 3, S. P. Boswall; 2, S. C. Stewart & Son.

Ewe shearling (4)—1 and 3 S. C. Stewart & Son; 2, Samuel Lane.

Ewe Lamb (5)—1 and 2, S. C. Stewart & Son; 3, S. L. Boswall.

Flock (2)—1, S. L. Boswall; 2, S. C. Stewart& Son.

Cotswold

Ram, 2 shears and over (1)—1, John Tweedy, Erncliffe.

Ewes, shearling (3)—1, Almon Boswall, Dunstaffnage; 2, John Tweedy.

Ewe, lamb (4)—1 and 3, Harry Tweedy, Erncliffee; 2, John Tweedy.

Ewe, 2 shears and over (7)—1, Almon Boswell; 2, John Tweedy; 3, Harry Tweedy.

Ewe, shearling, (6)— 1, John Tweedy; 2 and 3, Almon Tweedy.

Ewe lamb (5)—1, Almon Boswall; 2, John Twwedie; 3, Harry Tweedie.

Flock—1, John Tweedie; 2, Almon Boswall; 3, Harry Tweedie.

Lincolns

Ram, 2 shears and over (1)—Farmers' Milling Co., Mt. Herbert.

Ram shearilng (2)—1, Ernest Lund, Mt. Herbert;2, Albert Boswall French Fort.

Ram Lamb (4)—1, Albert Boswall; 2, Ernest Lund; 3, Farmers' Milling Co.

Ewe, 2 shears and over (6)—1, Ernest Lund; 2, Albert Boswall; 3, Farmers' Milling Co.

Ewe, shearling (4)—1, Albert Boswall; 2, Ernest Lund; 3, Farmers' Milling Co.

Ewe Lamb (4)—1 and 2, Albert Boswell; 3, Ernest Lund.

Flock (3)—1, Albert Boswall; 2, Ernest Lund; 3, Farmers' Milling Co.

Southdowns

Ram, 2 shears (2)—1, E. Saunders, Winsloe; 2, Olive Saunders, Winsloe.

1, shearling (2)—1, Oliver Saunders; 2, E. Saunders.

Ram, lamb (4)—1 and 2, Oliver Saunders; 3, E. Saunders.

Ewe, 2 shears and over (4)—1 and 3, E. Saunders; 2, Oliver Saunders.

Ewe, shearling (4)—1 and 2, E. Saunders, 3, Oliver Saunders.

Ewe lamb, (4)—1 and 3, Oliver Saunders; 2, E. Saunders.

Flock (2)—1, E. Saunders; 2, Oliver Saunders.

Shropshire Downs

Ram, 2 shears and over (1)—1, McDonald & Wood, Charlottetown.

Ramb Lamb (3)—1 and 3 Geo. L. Boswall; 2, Almon Boswall.

Ewe, 2 shears and over (4)—1, Almon Boswell; 2 and 3, Geo. Bosfall.

Ewe, shearling (3)—1, Almon Boswell; 2 and 3, Geo. Boswell.

Ewe Lamb, (2)—1, Geo. Boswall; 2, Almon Boswall.

Flock—1, Almon Boswall; 2, Geo. Boswall.

Oxford Downs

Ram, 2 shears and over, (4)—1, H. L. Boswall; 2and 3, J. M. Laird & Son.

Ram, shearling (3)—1 and 2, J. M. Laird & Son; 3, A. H. Boswall.

Ram lamb (6)—1 and 2, J. M. Laird & Son; 3, Farmers' Milling Co.

Ewe, 2 shears and over (6)—1, J. M. Laird & Son; 2, Farmers' Milling Co.; 3, A. H .Boswall.

Ewe, shearling (5)—1 and 3, Farmers' Milling Co.; 2, A. H. Boswall.

Ewe Lamb, (6)—1 and 2, J. M. Laird & Son; 3, A. H. Boswell.

Flock (3)—1, J. M. Laird & Son; 2, A. H. Boswall; 3, Farmers' Milling Co.

Oxford Down Association Prizes

Best yearling rams—1 and 2, J. M. Laid & Son; 3, A. H. Boswall.

Best yearling ewe (4)—1, A. H. Boswall; 2 and 3, J. M. Laird & Son.

Best pen, 4 lambs.—1, J. M. Laird & Son; 2, A. H. Boswall.

Suffolks

Ram, shearling (3)—1, A. P. Horne, Winsloe; 2 and 3, J. R. Horne, Winsloe.

Ram lamb—1, A. P. Horne; 2 and 3, J. R. Horne.

Ewe, 2 shears and over—1 A. P. Horne; 2 and 3, J. R. Horne.

Ewe, shearling—1 and 3, J. R. Horne; 2, A. P. Horne.

Flock.—1, A. P. Horne; 2, J. R. Horne.

Hampshire Downs

Ram, shearling.—1, Cephas Nunn.

Ram lamb (2)—1, Cephas Nunn; 2, Lorne J. Nunn.

Ewe, 2 shears and over (4)—1 and 2, Lorne Nunn; 3, Cephas Nunn.

Ewe, shearling (2)—1, Lorne Nunn; 2, Cephas Nunn.

Ewe Lamb.—1, Cephas Nunn; 2, Lorne Nunn.

Flock—1, Cephas Nunn; 2, Lorne Nunn.

Dorset Horns

Ram, 2 shears and over.—1, John Tweeedy.

Ram, shearling.—1, John Tweedy.

Ram lamb, (2)—1, Geo. Boswall; 2, John Tweedy.

Ewe, 2 shears and over.—1 and 2 George Boswall; 3, John Tweedy.

Ewe, shearling.—1, George Boswall; 2, John Tweedy.

Ewe Lamb.—1 and 2, Geo. L. Boswall; 3, John Tweedy.

Flock.—1, Geo. Boswall; 2, John Tweedy.

Cheviots

Ram, 2 shears and over.—1, C. D. McLean, Clyde River.

Ram lamb.—1, C. D. McLean; 2, Albert Boswall.

Ewe, 2 shears and over.—1 and 2, C. D. McLean; 3, Albert Boswall.

Romney Marsh Sheep

All prizes in this clas awarded to John Eweedy, Ernscliffe.

Long Wool Grades

Ewe, 2 shears and over.—1, S. L. Boswall.

Ewe, shearling (3)—1, Farmers' Milling Co.; 2, S. L. Boswall; 3, Samuel Lane.

Ewe lamb.—1, Samuel Lane; 2, S. L. Boswell; 3, Farmers' Milling Co.

Wether shearling.—1, Samuel Lane.

Wether Lamb.—1, Ernest Lund, 2, Samuel Lane.

Best fat ewe or wether.—1, S. C. Boswall.

Short or Medium Wool Grades

Ewe, 2 shears and over.—1, Oliver Saunders; 2, A. P. Horne; 3, A. H. Boswall; 4, Geo .Boswall; 5, J. M. Laird & Son.

Ewe shearling.—1, Geo. Boswall; 2, McDonald & Son; 3, Oliver Saunders.

Ewe Lamb.—1, J. M. Laird & Son; 2, Oliver Saunders; 3, E. Saunders.

Wether shearling—1, Cephas Nunn; 2, Oliver Saunders; 3, J. M .Laird & Son.

Wether lamb.—1, Almon Boswall; 2, Cephas Nunn; 3, Almon Saunders.

Best fat ewe or wether.—1 and 3, Oliver Saunders; 2, E. S. Saunders:

Fleece Wool

Domestic, fine medium.—1, Mary McDonald, Winsloe; 2, Oliver Sanders, Winsloe; 3, Heath Foster, Marshfield; 4, Earl Foster, York.

Domestic, medium.—1, E. Saunders, Winslie; 2, Heath Foster; 3, Earl Foster; 4, Oliver Sanders.

Domestic, coarse.—1, Samuel C. Lane, Mt. Mellish; 2, Ernest Lund, Mt. Herbert; 3, Earl Foster; 4, Heath Foster.

POULTRY

Anconas.—W. H. D. Vessey, York, 2c, 1h, 1r, 2p; E. J. Veysey, York, 1c, 1h, 3r, 1p.

Potatoes

Collection best early varieties.—1, Peter Brodie, York; 2, E. J. Veysey, York.

Collection best late varieties.—1, Peter Brodie; 2, E. J Veysey; 3, Jas. McLean, Mapleque Road.

Collection best white varieties.—1, Peter Brodie; 2, E. J .Veysey; 3, Jas. McLean.

Packed for export—1, Peter Brodie; 2, Geo. Howard, Winsloe; 3, E. J. Veysey.

Collection Field Roots, potatoes not included.—1, Arthur C. Wood, Alexander.

Garden Vegetables

Tomatoes, assorted collections, ripe—1, Robert McKinnon, Royalty.

Largest Squash grown seasoned 1919.—1, W. H. Johnson, Charlottetown.

Best collection table squash.—1, Ernest Burke, Southport; 2, A. C. Wood, Alexander.

Herbs, garden collection.—1, Geo. Chilton, Charlottetown; 2, A.C. Wood.

Best collection garden Vegetables.—1, Ai C. Wood.

Best sample 5 lbs. Beans in pod, grown season 1919.—1, A. C. Wood; 2, T. H. Moore, Charlottetown; 3, Seymour McLlennan, Alexander.

The Cape Breton Island Exhibition.

That the Island of Cape Breton is making rapid progress agriculturaly as well as industrially was again amply manifested at the splendid agricultural and live stock show held in Sydney, the industry hive of the island, on September 30th to October 3rd.

Cape Breton's industrial development, based on her wide coal fields, her richness in other minerals and her proximity to the ancient colony's extensive and easily accessible iron deposits has been nothing short of phenomenal. Industry attracted labor and consequently a large consuming public that furnish a market for farm products not excelled in any part of Canada. The farmers of Cape Breton, in their efforts to produce food for the thousands that must be fed, so near their doors, have been greatly encouraged in their work by their good markets and also by the friendly rivalry to excel that the Sydney exhibition has engendered among them.

One of the most progressive leaders by word and example among the farmers is D. R. Nicholson, the Secretary of the exhibition, who until about a year ago exhibited the largest herd of Holsteins in Cape Breton, which, unfortunately owing to a severe illness, he was reluctantly compelled to disperse. In the products of the garden and field he too made exceptionally good displays. We were pleased to note that Mr. Nicholson had sufficiently recovered from his illness to be again at the helm of exhibition affairs, although not as extensive an exhibition as formerly.

J. A. Young, president of the Exhibition Association, presided at the official opening exercises on the evening of Sept. 30th, when he recounted the progress made in exhibition matters since its inception in 1912. One of the contrasts between the 1912 show and that 1919 was the fact that ouly one pure bred animal in the cattle class was exhibited at the first show, whereas the present show boasted no fewer than 200 head. The total number of cattle entries had jumped from 75 head to over 500 head.

D. A. Cameron, M.LA., who is also prominently identified with Agriculture followed Mr. Young with an interesting account of how the exhibition executive had succeeded in interesting the mercantile and industrial elements of Sydney in exhibition matters to the extent that the business men of Sydney contributed $25,000 to make the Sydney exhibition a success without any hope of direct returns, a contribution the making of which they have had no reason to regret but rather express elation over the success of the show which they have so generously fostered.

Dr. Cumming, of the N. S. A. C., in the absence of Hon. Geo. H. Murray, Premier of the Province, who was unavoidably absent, delivered the official opening address. He referred in glowing terms to the agricultural possibilities of the County of Cape Breton which are many times greater than is conceded by men who have not made a careful study of them. The display at the Sydney Exhibition in the dairy cattle class was not excelled at any County show in the Province of Nova Scotia. The showing of grade sheep was also exceptionally good and as for agricultural products, especially the cabbage sections, had never been excelled at any Maritime show.

eW agree with Dr. Cumming. Lunenburg County must look well to her laurels in cabbage fame else the Cape Breton farmers will carry off the palm.

Dr. Cumming gave a most interesting account of the progress that is being made by the Creameries operated under government supervision at Baddeck and Margaree. The Baddeck Creamery for the four months ending August, 1918 had an output of 26,000 lbs. butter as compared with 39,000 pounds during the corresponding months of this year. The Margaree Cremery for the same months has increased from 22,000 pounds to 34,000 pounds.

Dr. Cummings in his closing remarks, made special reference to the advisability of using lime, either burnet or ground, wherever needed to correct soil acidity, improve the mechanical condition of the soil and help eradicate club root in turnips, which disease alone is responsible for a loss of at least $500,000 this year.

He also referred in terms of praise to the splendid exhibition made by the Boy Scouts of Sydney, an exhibition that gives ample proof of efficient leadership and strict attention to detail on the part of the members of the troop. The School exhibits also came in for special mention by Dr. Cumming, who is so much interested in and who has done so much for the farm boys of Nova Scotia.

As already referred to in reference to Dr. Cumming's address, the dairy cattle were the main feature of the exhibition with Ayrshires well in the lead. Nancy of Maple Forest, shown by J. B. Musgrave, of oNrth Sydney, carried off the sweepstakes diploma for best dairy cow, any age or breed. Bonnie Prince Peter, shown by J. R. Redmond, North Sydney, was first with three of his get. M. W. Ross & Sons' Jemima, of Spruce Grove, led the way with two of her progeny. M. W. Ross & Son also won the first place in the Ayrshire Breeders' Association specials for three calves bred by exhibitor and three animals, any age, get of one sire, bred by exhibitor, as well as winning Ayrshire hibitor. As well as winning Ayrshire male championship with their Jim McGregor and diploma for best herd. J. R. Redmond came in for second honors in these classes.

The Guernsey sowing was also very good, the honor for swepstakes diploma for best dairy bull any age or bred going to H. C. Corson's Conqueror's Image.

R. M. Jackson's Duchess of the Grove came in for lrst with two of her progeny. The best Guernsey female was Lets' Starry shown by H. C. Carson.

Holsteins were shown by W. Drysdale, Sydney; Munn Bros., A. J. Jackson & Son, R. M. Jackson and H. P. McKenzie, Blackett's Lake. The champion male was Rockdale Chief, shown by W. Drysdale. Munn Bros. Mercena Vale De Kol carried off the female championship. Munn Bros. carried off the choicest plums in the Holstein Association specials.

H. A. Moffat, J. J. Gillis, Geo. V. Oland, Allen Bros., and A. K. Jaskson & Son made a good showing with their Jerseys The male and female championships went to H. A. Moffats & Sons' Signor Bernice and Josie of Lake View. The Moffats also captured the choicest plums in many of the other sections of the Jersey class.

The grade cattle showing was exceptionally strong. The diploma for best female going to Albert Ferguson of Blockett's Lake.

The competition in the pure bred sheep classes was not keen as nearly every breeder had a walk over, although they had come prepared for conquest. There was a strong showing of grade sheep.

Yorkshires, Berkshires and Chester Whites with a good class of grades made up the swine class.

The poultry display was nothing to write home about.

M. W. Ross & Son carried off the special prize donated by McDonald Bros., to the exhibitor carrying off the greatest number of first prizes in pure bred cattle.

The judges were:

Horses—Jas. A. Fraser, New Glasgow.

Cattle—Prof. Trueman, N. S. A. C.

Sheep and Swine—Prof. Cumming, Truro.

Poultry—Joseph Landry, Truro.

Agriculture—F. L. Fuller, Truro.

Horticulture—W. N. Byers, Truro.

Dairy—W. A. McKay, Truro.

The prize winners in the various sections of the show will be found on succeeding pages.

PRIZE WINNERS AT THE CAPE BRETON EXHIBITION

HORSES

Draught Horses

Mare or Gelding, any breed or grade, 4 yrs. and over—1, W. Drysdale, Sydney; 2, Frank Miller, Gardiner Mines, C. B.; 3, Munn Bros., Leitches Creek Sta.

Mare or Gelding, any breed or grade, over 2, under 3 yrs.—1, D. R. Nicholson, Coxheath.

Mare or Gelding, any breed or grade, over 1 and under 2 yrs.—1, Frank Miller; 2, W. Drysdale.

Mare or Gelding, any breed or grade, under 1 yr.—1, Shaw & Mason, Sydney; 2, James Marnell, Whitney Pier, Sydney, C. B.

Brood Mare with foal by side—1, Shaw & Mason.

Best Mare or Gelding, any age—Diploma, Shaw & Mason.

Special prize offered by A. M. McLeod, Sydney for best Draft Mare or Gelding, any age, bred in Cape Breton County—1, Shaw & Mason, Sydney.

Carriage Horses

Stallion, any pure breed, 3 yrs. and over—1, J. J. Gillis, East Bay.

Mare or Gelding, any brede or grade, 4 yrs. and over—1, David Andrews, Coxheath; 2, William MacKinlay, MacKay's Corner; 3, D. R. Nicholson.

Mare or Gelding, any breed or grade, over 3 and under 4 yrs.—1, Patrick Carrol, MacKay's Corner.

Mare or Gelding, any breed or grade, over 2, under 3 yrs.—1, J. J. Gillis; 2, William MacKinlay.

Mare or Gelding, any breed ir grade, over 1 and under 2 yrs.—1, John Hill, Sydney, N. S.; 2, James Marnell, Whitney Pier, Sydney.

Mare or Gelding, any breed or grade, under 1 yr.—1, Allen Bros., North Sydney.

Brood Mare with foal by side—1, Allen Bros.

Best Mare or Gelding, any age,—Diploma, David Andrews, Coxheath, C. B.

Roadster Horses

Mare or Gelding, any breed, over 1 yr., under 2.—1, Charles Gardiner, North Sydney; 2, John W. MacKinnon, Sydney; 3, Mrs. Alex. J. Kennedy, Kenlock, C. B.

Mare or Gelding, any breed or grade, over 3, under 4 yrs.—1, Charles Gardine; 2, D. H. MacKay, Glace Bay.

Mare or Gelding, any breed or grade, over 2, under 3 yrs.—1, Albert Ferguson, Coxheath; 2, W. M. Hill, Point Edward; 3, Wm. McPherson, Sydney.

Mare or Gelding, any breed or grade, over 1yr., under 2 yrs.—1, J. J. Gillis, East Bay.

Mare or Gelding, any breed or grade, under 1 yr.—1, Shaw & Mason, Sydney; 2, Angus MacLeod, Whitney Pier, Sydney; 3, Jack McArthur, Sydney River.

Brood Mare with foal by side—1, Angus MacLeod; 2, Shaw & Mason; 3, Jack McArthur.

Mare or Gelding, any age—1, Charles Gardine.

Agricutlure Bona fide farm work horses

Mare or Gelding, 4 yrs. or upwards, over 1100 lbs.—1, Eugene Doncaster, Nuta Road, Sydney; 2, H. P. MacKenzie, Blackett's Lake; 3, Stanley Greene, North Sydney.

Mare or Gelding, over 2 yrs., under 3 yrs.—1, Albert C. Peters, Sydney; 2, Robert Meloney, Jacksonville.

Mare or Gelding, under 1 yr.—1, Allen Bros.

Brood Mare, with foal by side—1, Allen Bros.; 2, James Marnell.

Brood mare, and 2 of her progeny.—Diploma, Eugene Doncaster, Mira Road, Sydney.

Mare or Gelding, any age, not exceeding 1200 lbs.—1, M. W. Ross & Son; 2, Eugene Doncaster; 3, R. M. Jackson.

Ponies

Pony, any age, shown in harness or saddle—1, Wm. C. Nicholson, Coxheath.

Special Pulling Contest

Single team not over 1200—1, Walter Drysdale, Sydney; 2, Nelson Beaton; 3, Tie, H. B. MacKenzie, Blackett's Lake; and Stanley Greene, North Sydney.

Double Team, not over 2500 lbs.—1, Walter Drysdale; 2, R. V. Hall, Sydney; 3, H. P. MacKenzie.

Saddle Horses

Ladies Saddle Class—1 and 2, R. McGowan, Sydney; 2, Mr. Abass, Sydney.

CATTLE

Grade Beef Cattle

Fat Steer or Cow, 3 yrs. and over—1, R. M. Jackson, Jacksonville; 2, D. J. MacDonald, Sydney Forks; 3, J. J. Gillis, East Bay.

Fat Steer or Cow, over 2 under 3 yrs.—1, George V. Oland, Coxheath.

Fat Steer or Heifer, over 1, under 2 yrs.—1, George V. Oland; 2 and 3, James Marnell, Whitney Pier, Sydney.

Holsteins

Bull, over 2 yrs., under 3—1, Munn Bros., Leitches Creek.

Bull' over 1 yr., under 2 yrs.—1, W. Drysdale, Sydney; 2, Daniel Moreshead, Sydney River.

Bull, 6 mos. and under 1 yr.—1, A. J. Jackson & Son, Jacksonville.

Bull calf under 6 months—1, Munn Bros.

Cow in milk, 4 yrs. or over—1 and 2, Munn Bros.

Dry Cow, 4 yrs. and over—1, A. K. Jackson; 2, Munn Bros.

Cow, over 3 and under 4 yrs.—1, Munn Bros.

Cow, over 2 and under 3 yrs.—1, A. K. Jackson.

Heifer, over 2 and under 3 yrs.—1, H. P. MacKenzie, Blackett's Lake.

Heifer, over 18 mos., up to 24 mos.—1, W. Drysdale, Sydney; 2, R. M. Jackson; 3, A. K. Jackson.

Heifer Calf, over 6 mos., under 1 yr.—1, Munn Bros.; 2, W. Drysdale.

Heifer Calf, under 6 mos.—1, Munn Bros.; 2, A. K. Jackson; 3, Munn Bros.

Best Bull, any age—Diploma, W. Drysdale.

Herd (aged)—1, Munn Bros.

Best female—Diploma, Munn Bros.

Specials

Offered by the Holstein-Friesian Association of Canada. This competition only open to animals registered in C. H.-F. Herd Book.

Four calves, under 12 mos., bred by exhibitor—1, Munn Bros.

Three animals, any age, get of one sire, bred by exhibitor—1, Muns Bros.

Two animals, any age, progeny of one cow, bred by exhibitor—1, W. Drysdale; 2, Munn Bros.

Ayrshires, Pure Bred

Bull, 3 yrs. or over—1, South Bar Agricultural Society; 2, John R. Redmond, North Sydney.

Bull, over 2 and under 3 yrs.—1, M. W. Ross & Son, Sydney Mines.

Bull, iver 1 yr., under 2 yrs.—1, M. W. Ross & Son; 2, Beechmont Live Stock Association, Ball's Creek.

Bull, 6 months and under 1 yr.—1, John R. Redmond; 2, J. B. Musgrave, North Sydney.

Bull Calf, under 6 mos.—1, M. W. Ross & Son.

Cow in milk, 4 yrs. or over—1 and 2, M. W. Ross & Son; 3, John R. Redmond.

Dry Cow, 4 yrs. or over—1, J. B. Musgrave; 2, M. W. Ross & Son; 3, John R. Redmond.

Cow, over 3 and under 4 yrs.—1, M. W. Ross & Son.

Dry Cow, over 3, under 4 yrs.—1, J. B. Musgrave; 2, M. W. Ross & Son.

Cow, over 2 yrs., and under 3 yrs.—1, John R. Redmond; 2, M. W. Ross & Son; 3, A. B. MacPhee, Leitches Creek.

Heifer, over 2 yrs. and under 3 yrs.—1 and 2, M. W. Ross & Son.

Heifer, over 18 mos. up to 24 mos.—1, M. W. Ross & Son; 2, John R. Redmond.

Heifer, over 12 mos., up to 18 mos.—1, M. W. Ross & Son.

Heifer Calf, over 6 mos., under 1 yr.—1, D. J. McDonald, Sydney Forks; 2 and 3, M. W. Ross & Son.

Heifer Calf, under 6 mos.—1 and 3, M. W. Ross & Son; 2, John R. Redmond.

Best Bull, any age—1, M. W. Ross & Son.

Bull and 3 of his get—1, John R. Redmond.

Cow and 2 of her progeny—1, M. W. Ross & Son.

Herd—1, M. W. Ross & Son; 2, John R. Redmond.

Breeders' Young Herd—1, M. W. Ross & Son; 2, John R. Redmond.

Best Female—Diploma, J. B. Musgrave.

Special

Offered by the Ayrshire Breeders' Association.

3 calves, under 12 mos., bred by exhibitor—1, M. W. Ross & Son; 2, John R. Redmond;.

3 animals any age, get of one sire, bred by exhibitor—1, M. W. Ross & Son; 2, John R. Redmond.

Jersey Pure Bred

Bull, 3 yrs. or over—1, H. A. Moffat & Son, Groves Point; 2, J. J. Gillis; 3, George V. Oland.

Bull, over 1 yr. and under 2 yrs.—1, Allen Bros., North Sydney; 2, H. A. Moffatt.

Bull Calf, under 6 mos.—1, J. J. Gillis.

Cow in milk, 4 yrs. or over—1 and 2, J. J. Gillis; 3, Allen Bros.

Dry Cow, 4 yrs. or over—1, A. K. Jackson & Son; 2, Allen Bros.

Cow, over 3, under 4 yrs.—1, H. A. Moffatt & Son; 2, Allen Bros.

Cow, over 2 and under 3 yrs.—1 and 2, H. A. Moffatt & Son.

Heifer, over 2 and under 3 yrs.—1, Allen Bros.; 2, H. A. Moffatt & Son.

Heifer, over 18 mos. up to 24 mos.—1, A. K. Jackson & Son; 2 and 3, Allen Bros.

Heifer, over 12 mos., up to 18 mos.—1, H. A. Moffatt & Son; 2, Allen Bros.

Heifer Calf, over 6 mos., under 1 yr.—1 and 3, Allen Bros.; 2, A. K. Jackson.

Heifer Calf, under 6 mos.—1, Allen Bros.

Best Bull, any age—Diploma, H. A. Moffatt & Son.

Bull, and 3 of his get—Diploma, H. A. Moffatt & Son.

Cow, and 2 of her progeny—Diploma, H. A. Moffatt & Son.

Herd—1, H. A. Moffatt & Son; 2, Allen Bros.

Breeders' Young Herd—1, Allen Bros.

Best Female—Diploma, H. A. Moffatt & Son.

Guernsey—Pure Breed

Bull, 3 yrs. or over—1, H. C. Corson, South Ingonish; 2, W. J. Moffatt, Little Bras d'Or.

Bull, over 2 yrs., and under 3 yrs.—1, R. M. Jackson.

Bull, over 1 yr., under 2 yrs.—1, George's River Agricultural Society.

Bull, 6 mos., and under 1 yr.—1, H. C. Corson; 2, W. J. Moffatt.

Bull Calf, under 6 mos.—1, H. P. MacKenzie.

Cow in milk, 4 yrs. or over.—1, R. M. Jackson.

Dry Cow, 4 yrs. old or over—1, R. M. Jackson.

Cow, over 3 and under 4 yrs.—1, H. P. MacKenzie; 2, R. M. Jackson.

Cow, over 2 and under 3 yrs.—1, R. M. Jackson.

Heifer, over 2 and under 3 yrs.—1 and 2, R. M. Jackson.

Heifer, over 18 mos., up to 24 mos.—1 and 2, R. M. Jackson.

Heifer, over 12 mos., up to 18 mos.—1, H. C. Corson.

Heifer Calf, over 6 mos., under 1 yr.—1, H. C. Corson.

Best Bull, any age—Diploma, H. C. Corson.

Cow, and 2 of her progeny—Diploma, R. M. Jackson.

Herd—1, R. M. Jackson.

Best Female—Diploma, H. C. Corson.

Grade Jerseys

Sire to be pure bred and registered

Cow, 4 yrs. and upwards—1, Albert Ferguson, Coxheath; 2, J. B. Musgrave; 3, Bairncroft Orphanage, Sydney River.

Dry Cow, 4 yrs. and upwards—1, Patrick Carroe, McKay's Corner; 2, Allen Bros.; 3, Albert Ferguson.

Cow, 3 yrs.—1, Albert Ferguson; 2, J. B. Musgrave.

Cow, 2 yrs. old—1, George V. Oland; 2, John McMullin.

Heifer, over 18 mos., up to 24 mos.—1, J. B. Musgrave; 2, John McMullin; 3, James Marnell.

Heifer, over 12 mos., up to 18 mos.—1, George V. Oland; 2, J. B. M usgrave.

Heifer, 6 mos., under 1 yr.—1, Wallace Landry, Sydney; 2, J. B. Musgrave; 3, George V. Oland.

Heifer, under 6 mos.—H. A. Moffatt & Son; 2, Murdock MacKeigan, Coxheath; 3, George V. Oland.

Best female—Diploma, Albert Ferguson.

Grade Guernseys

Cow, 4 yrs. and upwards—1, H. P. MacKenzie; 2, Albert Ferguson; 3, Munn Bros.

Dry Cow, 4 yrs. and upwards—1, J. B. Musgrave; 2, H. A. Moffatt & Son; 3, H. B. MacKenzie.

Cow, 2 yrs.—1, George V. Oland.

Heifer, over 18 mos., up to 24 mos.—1, J. B. Musgrave.

Heifer, over 12 mos., up to 18 mos.—1, H. P. MacKenzie; 2, James Marnell; 3, Munn Bros.

Heifer, under 6 mos.—1, George V. Oland.

Best Female—Diploma, H. P. MacKenzie.

Grade Ayrshires

Cow, 4 yrs. and upwards—1, Albert Ferguson; 2, Allen Bros.; 3, J. B. Musgrave.

Dry Cow, 4 yrs. and up—1, John R. Redmond; 2 and 3, Arthur R. Richardson, South Bar.

Cow, 3 yrs.—1, Albert Ferguson; 2, Arthur R. Richardson.

Dry Cow, 3 yrs.—1, John MacMullin.

Cow, 2 yrs.—1, John R. Redmond; 2, George V. Oland; 3, Munn Bros.

Heifer, 2 yrs.—1, George V. Oland; Wallace Landry.

Heifer, over 18 mos., up to 24 mos.—1 and 3, Arthur R. Robinson; 2, W. Drysdale.

Heifer, over 12 mos., up to 18 mos.—1, John R. Redmond; 2, Stanley Greene, North Sydney; 3, Wilson Crow, Coxheath.

Heifer, 6 mos., under 1 yr.—1, John MacMullin.

Best Female—Diploma, Albert Ferguson.

Grade Holsteins

Cow, 4 yrs., and upwards—1, Munn Bros.; 2, Allen Bros.; 3, John R. Redmond.

Dry Cow, 4 yrs. and up—1, H. P. MacKenzie; 2 and 3, Munn Bros.

Cow, 2 yrs.—1, A. K. Jackson; 2, Munn rBos.; 3, George V. Oland.

Heifer, 2 yrs.—1, H. P. MacKenzie; 2, Wallace Landry.

Heifer, over 18 mos., up to 24—1, Wallace Landry.

Heifer, over 12 mos., up to 18 mos.—1, Henry H. Carson, Sydney; 2, David W. Jackson, Jacksonville; 3, George V. Oland.

Heifer, 6 mos. and under 1 yr.—1, A. K. Jackson & Son; 2, W. Drysdale.

Heifer, under 6 mos.—1, A. K. Jackson & Son; 2, Munn Bros.; 3, Murdock MacKeigan.

Best Female—Diploma, Munn Bros.

Grade Herds

Best herd, over 2 yrs., (5 cows),—1, Albert Ferguson; 2, Munn Bros.; 3, J. B. Musgrave.

Best herd, 4 cows, under 3 yrs.—1, George V. Oland; 2, J. B. Musgrave; 3, John MacMullin.

SHEEP

Leicesters, Pure Bred

All prizes in this class were taken by Elbridge Hill, Point Edward, C. B.

Cheviots

All prizes in this class went to Wilson Gillis, George River, C. B.

Southdown

All prizes in this class went to W. M. Hill, Point Edward, C. B.

Shropshire

Ram, 2 yrs. or over—1, Beechmont Live Stock Association, Ball's Creek; 2, Angus J. MacDonald; 3, Nelson Beaton, Coxheath, C. B.

Any Other Pure Breed

Ram, 2 yrs. or over—1, D. J. McKenzie, Ball's Creek.

Ram, over 1 yr., under 2 yrs.—1, John McMullin, George's River.

Ram Lamb—1, John McMullin.

Eewe, 2 yrs. or over—1 and 2, John McMullin.

Long Wool

Grades and Crosses, including Cotswilds, Leicesters.

Ewe, 2 yrs or over—1, Murdock MacKeigan, Coxheath; 2 and 3, Nelson Beaton.

Ewe, over 1 yr.—1, Wilson Gillis; 2, Nelson Beaton.

Ewe, Lamb—1 and 3, Nelson Beaton; 2, Murdock MacKeigan.

Pen, 2 Ewes, 2 Lambs—1, Nelson Beaton.

Medium Wool

Including Southdowns, Shropshires, Oxfords, Etc.

Ewe, 2 yrs. and over—1, D. J. McKenzie; 2, John McMullin; 3, W. M. Hill.

Ewe, over 1 yr.—1, Elbridge Hill; 2, D. J. McKenzie; 3, Angus J. McDonald, Beechmont North.

Ewe Lamb—1, Murdock MacKeigan, Coxheath; 2, D. J. MacKenzie; 3, Angus J. McDonald.

Pen, 2 Ewes, 2 Lambs—1, D. J. McKenzie; 2, Elbridge Hill; 3, Angus J. McDonald.

Fat Sheep

Fat Ewe—1, W. J. Moffatt, North

Sydney; 2, Murdock MacKeigan; 3, Elbridge Hill.

Fat Ewe Lamb—1, W. J. Moffatt; 2, Angus J. McDonald; 3, Murdock MacKeigan.

Special prize for Best Pen Pure Bred Sheep, given by D. A. Cameron, M. P. P., Sydney, C. B.—Elbridge Hill, Point Edward.

SWINE

Berkshire

Boar, 1 yr. or over—1, George V. Oland, Coxheath.

Sow, 1 yr. or over—1 and 3, George V. Oland; 2, D. J. MacKeigan.

Sow, under 6 mos.—1, Murdock MacKeigan, Coxheath.

Best Herd, Boar, 3 Females, 2 of which must be over 6 mos.—1, George V. Oland.

Yorkshire

Boar, 1 yr. or over—1, eGorge V. Oland.

Boar, under 1 yr.—1, George V. Oland.

Sow, 1 yr. or over—1, H. A. Moffatt & Son; 2, George V. Oland.

Sow, under 6 mos.—1 and 2, Munn Bros., Leitches Creek; 3, George V. Oland.

Sow and Litter—1, George V. Oland.

Best Herd Boar and 3 Females—1, George V. Oland.

Chester White

All prizes in this class won by George V. Oland.

Any Other Pure Breed

Boar, 1 yr. or over—1, J. J. Gillis, East Bay.

Sow, 1 year or over—1 and 2, George V. Oland.

Grades and Crosses

Sow, 1 yr. or over—1, Lorne Boutilier, Sydney River; 2, George V. Oland; 3, P. McMahon, Sydney River.

Sow, under 6 mos.—1, W. Drysdale, Sydney; 2, Wallace Landry, Sydney; 3, Munn Bros.

Sow and Litter—1, George V. Oland.

Fat Hog, Sow or Barrow, 1 yr. and over—1 and 2, George V. Oland.

Fat Hog, Sow or Barrow, under 6 mos.—1, W. Drysdale; 2, George V. Oland; 3, Murdock MacKeigan.

POULTRY

Brahmas, Light or Dark Cockerel—2, J. E. McNally, Sydney, C. B.

Pullet—2, J. E. McNally.

Barred Plymouth Rocks, Cock—1, M. W. Ross & Son, Sydney Mines

Hen—1 and 2, M. W. Ross; 3, James D. Hartigan, Whitney Pier, Sydney.

Cockerel—1 and 2, Robert McDonald, Sydney; 3, James McNally.

Pullet—1, 2 and 3, Robert McDonald.

White Plymouth Rocks, Cock—1 and 2, J. Douglas Lawly, Glace Bay.

Hen—1 and 2, R. M. Jackson, Jacksonville, C. B.; 3, J. Douglas Lawly.

Cockerel—1 and 2, R. M. Jackson; 3, J. Douglas Lawly.

Pullet—1 and 2, R. M. Jackson; 3, J. Douglas Lawly .

White Wyandottes, Cock—1, M. W. Ross & Son; 2, Wm. C. Nicholson, Coxheath.

Hen—1 and 2, M. W. Ross & Son; 3, Wm. C. Nicholson.

Cockerel—1 and 2, Alex. C. Morrison, Sydney.

Single Comb Rhode Island Reds, Cock—1, Arthur R. Richardson, South Bar, Sydney, C. B.

Hen—1, Arthur R. Richardson.

Cockerel—1, Arthur R. Richardson; 2, Lorne Boutilier, Sydney River.

Pullet—1, Arthur R. Richardson; 2 and 3, Lorne Boutilier.

Single Comb White Leghorns, Cock—1, Georgina MacLennan, Sydney River; 2, Roger M. Lewis, Coxheath.

Hen—1, 2 and 3, M. W. Ross & Son.

Cockerel—1, Charlie Green, Westmount; 2, Wm. C. Nicholson, Coxheath; 3, M. W. Ross & Son.

Pullet—1, Charlie Green; 2, Lorne Boutilier; 3, M. W. Ross & Son.

Single Comb Brown Leghorn, Cockerel—1 and 2, J. Douglas Lawly.

Rose Comb Brown Leghorns, Cock—1, M. W. Ross & Son.

Hen—1, 2 and 3, M. W. Ross & Son.

Cockerel—1 and 2, J. Douglas Lawly.

Jullet—1, J. Douglas Lawly.

Black Minorcas, Hen—1 and 2, M. W. Ross & Son.

Cockerel—1, J. E. McNally; 2, B. A. Lewis, Sydney River.

Pullet—1, B. A. Lewis; 2, J. E. McNally.

White Minorcas, Cock—1, M. W. Ross & Son.

Hen—1, 2 and 3, M. W. Ross & Son.

Hamburgs, all varieties, Cock and Hen—2, M. W. Ross & Son.

Polands, Hen—1, J. Douglas Lawly.

Single Comb Mottled Anconas, Hen—1 and 2, M. W. Ross & Son.

Games, Cockerel—1, J. E. McNally.

Pullet—1, J. E. McNally; 2, B. A. Lewis, Sydney River.

Any other variety, Cock—1, J. Douglas Lawly.

Hen—1, J. Douglas Lawly.

Cockerel—1, J. Douglas Lawly.

Pullet—1 and 2, J. Douglas Lawly.

Game Bantams, Cock—1, J. Douglas Lawly.

Hen—1, J. Douglas Lawly; 2 and 3, M. W. Ross & Son.

Cockerel—1, M. W. Ross & Son.

Pullet—1, 2 and 3, M. W. Ross & Son.

Black Cochin Bantams, Cock—1, J. Douglas Lawly.

Hen—1, 2, J. Douglas Lawly.

Breeding Pens

Adult Birds, Rhode Island Reds—1, Lorne Boutilier.

Any Other Variety—1, J. E. McNally; 2, Roger M. Lewis; 3, Lorne Boutilier.

GEESE

Toulouse, male, senior—1, H. A. Moffatt & Son, Grove Point.

Toulouse, male, junior—1, H. A. Moffatt; 2, Mrs. John J. Neville, Whitney Pier, Sydney.

Toulouse, Female, senior—1, H. A. Moffatt.

Toulouse, Female, junior—1, H. A. Moffatt; 2, Mrs. John J. Neville.

Male, any other variety, senior—1, Mrs. John J. Neville.

Male, A. O. V., junior—1, Mrs. John J. Neville.

Female, A. O. V., senior—1, Mrs. John J. Neville.

Female, A. O. V., junior—1, Mrs. John J. Neville.

DUCKS

Pekin Male, senior—1, Harry F. Lewis, Sydney River; 2, H. A. Moffatt & Son; 3, Georgina MacLennan.

Pekin Male, junior—1, Harry F. Lewis.

Pekin, Female, senior—1, Harry F. Lewis; 2, Georgina MacLennan; 3, H. A. Moffatt & Son.

Pekin, Female, junior—1, Harry F. Lewis.

Pet and Fancy Stock

Pair Rabbits—1, Mrs. S. A. Ritchie, Sydney; 2, Roland McDonald, Sydney; 3, David Crawford, Sydney.

DRESSED POULTRY

Pair Fat Fowls—1, Mrs. E. J. Johnson, George's River; 2, Mrs. H. A. Moffatt, Groves Point.

Pair Fat Chickens—1, Mrs. E. J. Johnson.

Pair Fat Ducks—1, Mrs. H. A. Moffatt.

Fat Goose—1, Mrs. H. A. Moffatt.

EGGS

Heaviest and best doz. White Eyys—1, Mrs. Mary Beaton, Coxheath; 2, Murdock MacKeigan, Coxheath.

Heaviest and best doz. Brown Eygs—1, R. M. Jackson, Jacksonville; 2, Munn Bros., Leitches Creek; 3, Murdock MacKeigan.

BUTTER

Best Crock of Tub Butter, 15 lbs.—1, Mrs. D. MacLennan, Upper Middle River, 94; 2, Mrs. E. J. Johnston, George River, 93.5; 3, Mrs. R. W. Munroe, Salem Road, 91.5.

Best Butter in print—1, Mrs. E. J. Johnston, 93; 2, H. P. MacKenzie, Blackett's Lake, 92.5.

Butter, granular, made in private dairy—1, H. P. MacKenzie; 2, Mrs. E. J. Johnston.

Butter, fancy display—1, Mrs. D. J. MacDonald, Howie Centre, Sydney Forks, C. B.

GRAIN AND SEED

Best ½ bush. Wheat, White Spring—1, Charles Andrew, Coxheath.

Best ½ bush. Wheat, Red Spring—1, John McMullin, George River.

Best ½ bush. Barley, 2 row—1, John McMullin.

Best ½ bush. Oats, White—1, Charles Andrew; 2, David Andrews; 3, John McMullin.

½ bush. Oats, Black—1, Nelson Beaton.

½ bush. Buckwheat, Silverhull—1, John McMullin.

Hops—1, Mrs. Everett McLean, Sydney; 2, R. M. Jackson, Jacksonville, C. B.; 3, Mrs. Harriet Clarke, Coxheath.

Best Sheaf Wheat, white—1, Charles Andrews; 2, H. A. Moffatt & Son, Groves Point; 3, David Andrews.

Best Sheaf Wheat, Red—1, D. H. MacKay, Glace Bay; 2, John McMullin; 3, Wilson Gillis.

Sheaf White Oats, 7 in. in diam.—1, Charles Andrews! 2, Mrs. W. J. Moffatt; 3, John McMullin.

Sheaf Black Oats, 7 in. in diam.—1, Nelson Beaton; 2, Mrs. W. J. Moffatt.

Sheaf Barley—1, Mrs. W. J. Moffatt; 2, M. S. Currie, Grand Mira South; 3, Jihn McMullin.

Sheaf Timothy—1, Charles Andrews; 2, Mrs. W. J. Moffatt; 3, Wilson Gillis.

Pole Beans, 1 pole as grown—1, Malcolm McLean; 2, John McMullin.

Timothy—1, Charles Andrews; 2, David Andrews.

FIELD ROOTS

Potatoes

Round whilte type such as Irish Cobbler.—1, Wilson Gillis, Georges River; 2, H. P. McKenzie, Blackett's Lake; 3, David Andrews, Coxheath; 5, Nelson Beaton, Cox Heath.

Oval white top, such as Green Mt., Carmen, etc.—1, Wilson Gillis; 2, David Andrews; 3, Charles Andrews;

Long white type, such as Burbank, etc.—1, David Andrews; 2, Nelson Beaton; 3, John McMullin.

Rose type, such as Early Rose, etc.—1, Wilson Gillis; 2, John McMullin; 3, Malcolm McLean, Sydney; 4, M. W. Ross & Son, Sydney Mines.

Red Skinned variety.—1, David Andrews; 2, Nelson Beaton; 3, M. D. Curry, Mira.

Dark Skinned variety.—1, M. W. Ross & Son; 2, John McMullin; 3, W. M. Hill, Point Edward; 4, H. P. McKenzie.

Turnips

Swede Type, table use.—1, M. W. Ross & Son; 2, John McMullin; 3, H. A. Moffatt & Son; 4, Munn Bros.; 5, Mrs. E. J. Johnson, Georges River.

Swede type, Purple Top, for feeding.—1, John McMullin.

Swede Turnips, Bronze Top.—1, John McMullin.

Aberdeen Yellow Turnips.—1, John McuMllin.

Greyston or White Globe Turnips.—1, H. A. Moffatt & Son.

Mangolds, Long Red.—1, Harry F. Lewis; 2, John McMullin.

Mangolds Yellow Globe.—1, John McMullin.

Mangolds, Long Yellow.—1, John McMullin.

Mangolds, A.O.V.—1, John McMullin.

Sugar Beets for Feeding.—1, Harry F. Lewis; 2, John McMullin; 3, Chas. Andrews.

GARDEN VEGETABLES

Heaviest Head Cabbage.—1, Murdock MacKeigan, Coxheath; 2, Chas. Andrews, Coxheath; 3, David Andrews, Coxheath.

Collection Tomatoes.—1, C. W. Moffatt, North Sydney.

Largest Collection Herbs.—1, C. W. Moffat; 2, Mrs. Harriet Clarke, Coxheath; 3, H. A. Moffat & Son, Groves Pt.

Largest Squash, any variety.—1, Harry F. Lewis, Sydney River.

Collection from any one farm.—1, John McMullin, Georges River.

Carrots, Long Red.—1, Mrs. Everett McLean, Sydney; 2, C. W. Moffatt; 3, Frank McNeil, Sydney.

Carrots, Half Long Red.—1, Malcolm McLean, Sydney; 2, Alex. McLean, Sydney; 3, Mrs. Eeverett McLean.

Carrots, Short Red.—1, H. A. Moffat & Son; 2, Harry F. Lewis; 3, Chas. Andrews.

Carrots, White.—1, C. W. Moffatt, 2, John McMullin; 3, M. S. Currie, Grand Mira.

Beets, Long Red.—1, C. W. Moffatt; 2, Charles Andrews.

Beets, Turnip Blood.—1, Harry F. Lewis; 2, Charles Andrews; 3, David Andrews.

Beets, Egyptian—1, John McMullin; 2, David Andrews; 3, Charles Andrews.

Parsnips, any variety.—1, A. Southby, Sydney; 2, Malcolm McLean; 3, C. W. Moffatt.

Onions, Yellow.—Harry F. Lewis; 2, Charles Andrews; 3, C. W. Moffatt.

Onions, white.—1, Mrs. Everett McLean; 2,C. W. Moffatt.

Onions, red.—1, C. W. Moffatt; 2, John McMullin.

Onions, pickling.—1, C. W. Moffatt; 2, Charles Andrews; 3, M. W. Ross & Son.

Celery, white or yellow.—1, J. E. Burchill, Sydney; 2, Malcolm McLean; 3, John McMullin.

Celery, red or pink.—1, C. W. Moffatt.

Cauliflower.—1, Mrs. W. J. Moffatt, North Sydney; 2, Harry F. Lewis; 3, Charles E. Lewis, Coxhead.

Cabbage, flat shaped.—1, Murdock MacKeigan; 2, Harry F. Lewis; 3, Challes Andrews.

Cabbage, conical.—1, Charles Andrews; 2, David Andrews.

Cabbage, round.—1, Charles Andrews; 2, Murdock MacKeigan; 3, Harry F. Lewis.

Cabbage, Red.—1, David Andrews; 2, Charles Andrews.

Cabbage, Savoy—1, Charles Andrews; 2, David Andrews.

Tomato, Red.—1, Harry F. Lewis.

Cluster Tomatoes.—1, C. W. Moffatt 2, John McMullin; 3, Harry F. Lewis.

Melons for preserving.—1, Wilson Gillis.

Cucumbers, white spine.—1, M. W. Ross & Son; 2, H. T. Moffatt & Son; 3, David Andrews.

Cucumbers, long table variety.—1, David Andrews; 2, Harry F. Lewis,

Cucumbers, pickling.—1, John McMullin; 2, Wilson Gillis; 3, M. W. Ross & Son.

Cucumbers for seeding.—1, David Andrews; 2, Harry F. Lewis; 3, M. W. Ross & Son.

Ears Corn, yellow.—1, C. W. Moffatt

Lettuce.—1, Miss Sadie McLean, Sydney; 2, C. W. Moffatt; 3, Mrs. D. E. Read, Sydney.

Lettuce, cabbage or heading.—1, Harry F. Lewis; 2, C. W. Moffatt; 3, Frank McNeil, Sydney.

Radish, round shaped.— C. W. Moffatt; 2, Harry F. Lewis; 3, John McMullin.

Radish, long.—1, John McMullin; 2, C. W. Moffatt; 3, Harry F. Lewis.

Radish, olive shaped.—1, C. W. Moffatt; 2, Harry F. Lewis.

Peas ,in pod and shell.—1, John McMullin; H .A. Moffatt & Son; 3, Jas. Marnell, Whitney Pier, Sydney.

Beans, white, half in pod, half shelled.—1, Frank E. Jackson, North Sydney; 2, Mrs. Everett McLean; 3, N. S. Currie.

Leeks.—1, C. W. Moffatt.

Squash, Boston Marrow.—1, C. W. Moffatt; 2, Alex, McLean.

Squash, Hubbard.—1, Wilson Gillis; 2, Mrs. Charles M. Hill, Sydney; 3, Alex. McLean.

Squash, Brook Neck.—1, John Mcl

Mullin; 2, George V. Oland; 3, Chas. E. Lewis.

Squash, any variety.—1, Harry F. Lewis.

Vegetable Marrow.—1, Mrs. Charles M. Hill; 2, A. Southby; 3, David Andrews.

Pumpkins for table use.—1, Charles Andrews; 2, P. McMahon, Sydney River; 3, Harry F. Lewis.

Pumpkins, largest for feeding.—1, P. McMahon.

String Beans.—1, Mrs. W. F. MacCurdy, Baddeck; 2, James Marnell.

HORTICULTURE

Best collection 6 varieties—1, Munn Bros., Yeithes Creek; 2, M. D. Currie, Grand Mira South; 3, H. P. MacKenzie, Blackett's Lake.

Best collection fruit from one farm artistically arranged.—1, Munn Bros.

Best box Apples, packed for market.—1, Mrs. E. J. Johston, Georges River.

Collection Plums.—1, Mrs. M. J. Johnston; 2, M W. Ross & Son, Sydney Mines; 3, John McMullin, Georges River; 4, Roger M. Lewis, Coxheath.

SPECIAL PRIZES

Offered by Cross Fertilizer Co., Sydney for 4 Counties of Cape Breton

Best collection Sheaf Wheat, Barley, Oats and Timothy.—Mrs. M. J. Moffatt, Little Bras d'Or.

Best collection field oats and garden vegetables.—John McMullin, Georges River.

Best herd pure bred cattle, any breed.—M.W. Ross & Son (Ayrishies.)

For sweepstakes pure bred cow in dairy class.—J. B. Musgrave, North Sydney.

Offered by J. E. Burchell, Sydney

Best five heads Celery.—J.E. Burchell, Sydney.

Best two heads Cauliflower.—Mrs. W. J. Moffatt, Little Bras d'Or.

Offered by J. C .Douglas, M.P., Glace Bay

Best crock Dairy Butter.—Mrs. D. McLean, Upper Middle River.

Offered by J. F. Merchant & Son Sydney

Best collection field roots and garden vegetables from any one farm in C. B. Island.—John McMullin.

Offered by J. Fisher Grant

Best Carriage Horse in Harness.—David Andrews, Coxhead.

Offered by H. A. Cameron

Best Pen Pure Bred Sheep.—Elbride Hill, Point Edward.

Best collection Seed grown on one farm.—John McMullin.

Offered by Thompson & Sutherland Sydney

To pupil taking largest number of prizes in the Rural School Garden.—Earl Moffatt, Little Bras d'Or.

Offered by F. J. Morley, Sydney

To pupil from the city scools having best display of vegetables.—Manverly Hill, Sydney.

Offered by Oak Hall, Sydney

For sweepstakes cow in pure bred class.—J. B. Musgrave, North Sydney.

Offered by Harrington's Chine Store, Sydney

To exhibitor winning largest number of prizes in dressed poultry.—Mrs. H. A. Moffatt, Groves Point.

Offered by Crowells, Ltd, Sydney

To the boy or girl from city School sowing best spring pig any breed or grade.—Mauverly Hill.

To the boy or girl from Rural School showing best spring pig, any breed or grade.—1, Janie McKenzie, Ball's Creek; 2, Earl Moffatt, Little Bras d'Or.

Offered by Neil Ferguson

For best grade Ayrshire heifer over 12 months, up to 18 months.—1, John Redmond, North Sydney.

Offred by A. M. McLeod, Sydney

Best high grade Mare or Gelding, any age, bred in Cape Breton County. —Shaw & Mason, Sydney.

Offered by Eastern Jewellery Co. Sydney

Mare or Gelding, 4 years old or upwards, Agricultural class, over 1100 lbs.—Silver Cub, Eugene Doncaster, Sydney.

Offered by McDonald Bros.

To exhibitor winning the most first prizes in Pure Bred Cattle.—M. W. Ross & Son.

Offered by T. Eeaton & Co., Toronto

Best 10 lbs. Butter by a maker who has not won an Eaton prize.—Mrs. McLennan, Upper Middle River.

The Chatham Exhibition

The eighth Agricultural and Industrial Fair and Live Stock Show of the Miramichi Agricultural Exhibition Association, was held on their spacious well appointed grounds, at Chatham, on September 22nd to 26th, with the contests open to all Canada. This made the fourth fair, of this nature, held in the Province of New Brunswick this year.

Mr. Geo. E. Fisher, the genial, efficient manager of the former Chatham shows, was again in charge of affairs, and that fact alone was sufficient guarantee to exhibitors, and the general public that no stone would be left unturned that would tend towards the success of the fair. Mr. Fisher is a thorough agriculturist, who practices what he preaches, and as such he has the unbounded confidence of the good farmers of Northumberland County. His example, like that of such men as R. A. Snowball, Henry Gordon, Jas. Bremner, the Traers, the Dickson's, the White's, the Johnson's and others is a steady impetus to the development of agriculture on the banks of the majestic Miramichi, a county rich in possibilities—the combined resources of the farm, the forest and the sea.

The fair was well attended and despite the fact that late harvests mitigated against the show, which was not up to the standard of the Miramichi exhibition of 1915, yet there was at Chatham one of the two best displays of agricultural products seen at any Maritime Exhibition this year. The Traer and Fisher collections of garden produce could not be passed by the visitors withiut evoking expressions if admiration. The garden vegetables display made by the pupils of the Chatham schools, as well as their handiwork in Manual Training and Domestic Science, easily outclassed similar displays at all the other shows this year.

There was also a good display of agricultural products. The showing in grains and potatoes was particularly commendable.

Dairy produce and household arts made a splendid showing. A frosted cake, a miniature model of the Miramichi Fair Buildings made and exhibited by Mrs. Pallen, of Chatham, displayed exceptional ingenuity and excellent workmanship. This toothsome cake was sold at the close of the fair for the benefit of Hotel Dieu Hospital.

The domestic and fancy work departments showed that the good ladies of Miramichi county are experts in the arts that tend to comfortable home making.

The various booths in the main building were tastily decorated. Among the various features displayed therein were teh Apiarian exhibits of the New Brunswick Department in charge of Mr. L. T. Floyd, the provincial apiarist, who is ever ready to spread the gospel of the honey bee and whose activities among the bee keepers of the province is responsible for a great increase in the output of the apiaries of the province this year, which will add hundreds of dollars to the income from the farms. Mr. J. W. Vanderbeck of Millerton also made an interesting exhibit of bees and bee products.

Mr. A. G. Turney, the provincial horticulturist, staged the splendid exhibit of apples which was shown at Fredericton during the previous week. The Dominion Experimental Farms and the Dominion Live Stock and Poultry Divisions had their instructive exhibits in position with competent men in charge, who were kept busy giving the inquiring public a lot of valuable information in their respective departments.

The live stock show so far as it went had quality to burn, but there were too many empty stalls.

In the beef classes, R. A. Snowball's Shorthorns and the Prince Edward Island herd of Aberdeen Angus cattle owned by Horne Bros., were out in good condition, despite the fact that they were getting exhibition weary, after their tour of the other fairs.

McIntyre Bros. and John Retson were on hand with their Ayrshire herds. Messrs. Libby and Jolly from the Province of Quebec showed their Brown Swiss cattle. J. R. Semple & Son, Truro, showed Jersey's, and Dickie Bros. showed their Holsteins. Jas. Bremner of Chatham showed a splendid aged Holstein bull.

There was a nice showing of sheep, including the upper Province, Prince Edward Island and Nova Scotia uocks, showed at Fredericton during the previous week.

The Swine Classes were not very extensively filled. Semple & Son made a good showing wtih their Berkshires.

The showing in utility poultry was fair.

The judges were:—

Horses—Alex. Ness.

Beef Cattle and Sheep—John Guardhouse.

Poultry—Mr. Clark.

Dairy Cattle—W. W. Ballantyne.

Agricultural Products—O. C. Hicks.

Dairy Products—H. B. Coleman.

Honey—L. T. Floyd.

Prizes in Egg Laying Contest at Charlottetown

When the Laying Contest commenced last November, there was a considerable list of valuable prizes donated for the winners. Some of these prizes have been awarded throughout the contest, but the bulk of them, and the most valuable, cannot be donated until the contest closed, September 30th.

Among the prizes won during the contest were "Ribbons" donated by the Gold Stamping Co., Montreal, given to the pen in each class showing the highest revenue each month during the contest. The ribbons were won by:

Heavy Class: November, James Speirs, Tracadie, P. E. I.; December, January and July, Thomas Adamson, Laurel, P. Q.; February and April, H. H. Dowton, 195 Cowan Ave., Toronto; March, P. E. Aird, Montreal; May and August, A. T. Reed, Rolling Dam, N. B.; June, Miss Molly Neales, Hartland, N. B.

Light Class: November, December, February and March, C. B. Chapman, Amherst, N. S.; January, William J. McKinnon, Truro, N. S.; April, May and June, F. W. E. Haslam, Bradalbane, P. E. I.; July, Mrs. Gordon McMillan, North River, P. E. I.; August, Rev. J. J. McDonald, Kinkora, P. E. I.

Four bags Purina Chick Chowder were donated by the Chisholm Milling Co., Toronto, to the pen giving the highest record for each of the four months, November, December, January and February. This prize was awarded as follows: November, James Speirs; December and January, T. J. Adamson; February, William J. McKinnon.

"Morgan's Roup Cure" donated by A. J. Morgan, London, Ont., to the hen each month that lays the greatest weight of eggs, won as follows: November, L. H. Warren, St. Lambert, P. Q.; December and July, T. J. Adamson; January, William J. McKinnon; April and May, H. H. Dowton; March, C. B. Chapman; June, F. W. E. Haslam; August, A. T. Reed.

Cash prize, $10.00 donated by A. P. Hillhouse, Foster, Que., to the pen giving the highest aggregate for the four winter months, won by T. J. Adamson.

The prizes to be donated at the close of the contest, and for some of which there is going to be a keen competition, are the following:

One $50.00 silver cup, one Candee Colony Brooder, valued at $60.00, one Root Cutter, $10.00, Bronze Medal, $5.00, one Cycle Hatcher, $10.00, one pen Barred Rocks, 8 pullets and one cockerel, $30.00, one pen of White Leghorns, 8 pullets and 1 cockerel, $25.00, one Feed Hopper, and cash prizes amounting to $35.00.

The new contest opens November 1, for which entries are rapidly filling. Further particulars regarding this contest may be had from J. A. Clark, Superintendent Experimental Station.

CALL FOR MORE HOGS

H. S. Arkell, Live Stock Commissioner, who has recently returned from a trip to Europe where he has reviewed the live stock market situation, has expressed his views, regarding Canada's position, in the October number of The Agricultural Gazette. He states that the London agents of our Canadian packers reviewed in disappointment the orders for Canadian goods—bacon, eggs, etc.—for which they could obtain but a tenth of the product they required. The unwarranted high price of hogs in Canada during the past month is but a reflection on the reputation of Canadian bacon, as compared with American, and demonstrates the effort of our packers to maintain their connection with old established clients in the face of short supplies. Since Denmark, within a year, will again be a factor on the bacon market our only security for the future is full production and such a substantial export supply as must command recognition by its volume and quality. Short hog production is unquestionably the most dangerous policy Canada can adopt. This is true of eggs as well as bacon.

ANOTHER 50 POUND COW

The Holstein-Friesian cow, Creampot Pontiac Korndyke, owned by Cole & Hicks, Granville, N. Y., has just completed a seven day record of 51.31 pounds butter and 861.00 pounds milk. This is the largest record ever made in the United States, and stands second in the world only that of the Canadian cow, Rolo Mercena DeKol, 51.93 pounds.

While the cows are on pasture is a good time to plan for lightening up their winter homes. Get rid of the dark places and the narrow corners, broken floors and ramshackle doors.

HORTICULTURE.

THE VITALITY OF "SEED" POTATOES.—NOW IS THE TIME TO PRESERVE IT

It is not customary in the fall for the average farmer to make any provision regarding seed potatoes for spring planting. That duty is generally left over till spring time arrives, and the potatoes chosen for planting are taken from what is left over from winter use. This practice, though common with farmers, is not conducive to best results in growing profitable potato crops. While a large share of the success in potato growing is due to the soil, manuring and climate in which they are grown, the quality of the seed has about as much influence on crop bearing as any other possible condition. One thing at least is true, that no good condition of soil or climate will suffice if the seed planted lacks vitality.

Difference Between "Seed" and Seed

Ia is the preservation of vitality in seed potatoes that is the first duty of the potato grower and fall time is the correct time to acomplish it. It is well known that seed potatoes taken from a northern or later climate are more productive than seed taken and planted in the district where grown. This is why seed are taken from northern Ontario in order to get better results when grown in the earlier distriits in the south.

The term "seed" when applied to the potato to be used for planting, is a misnomer, and in no way conveys the true idea of the strange reproduction that takes place in the plant. Seeds proper, are the fertliized ovule in all flowering plants, and when ripe fall out, and many species remain dormant in the soil for years till favorable condition arise, when they will burst with an activity that shows they have not in any way lost their vitality by ripening. But potato "seed" or tuber is more akin to the "cutting" or budding part of a plant which all horticulturists know requires different treatment from the seed of the same plant. Old and ripened wood does not make the best cutting for propagation, neither will ripened potatoes give the best results when planted. Irregularity in growing and many failures of sprouting in the field are the result of over ripened tubers set apart for crop growing.

The Time to Dig Seed Potatoes

In order, therefore, to get the best results in growing a full crop of potatoes farmers should dig up their seed potatoes, before they get over-ripened or into that condition which is commonly known as "dead eyed." where the ability to sprout is materially affected. This only refers to seed potatoes; the cooking qualities are not spoiled by leaving the rest of the crop till some time later. Taking up the seed before they are fully ripe will have the same effect as taking seed from a later to an earlier climate, as is now advocated for Canadian farmers.

Side by side with dairying in Ayrshire Scotland there is undertaken potato growing, and the way farmers there preserve the vitality of the seed for spring use is in conformity with this idea. Most of their early crops of potatoes are grown from boxed seed—that is potatoes sprouted in boxes before planting. The crop they produce is taken up early in the season, and a portion of the ground is again planted to grow seed potatoes. These never have time to mature before winter, but they are in the best state for sed purposes, and are preserved for that purpose alone. These immature tubers are in great demand in England and the more earlier districts, a demand has arisen with the pronounced benefit buyers get from this change of seed.

Storing Them in Winter

The securing of seed potatoes early from the field is not all that is required in conserving seed vitalily, as a proper place for storing them throughout the winter is necessary. The very worst plan for seed potatoes is to take them from a bin or cellar in the springtime where they have been kept in the dark without air circulation all winter. This treatment, though it does not spoil the tuber for culinary purposes, completely spoils it for seed purposes. So long as potatoes are kept free from frost and are fit for culinary use, the average farmer does not worry over its crop bearing qualities ,and this has perhaps more to do with the failures in potato growing that causes much surprise, as coming from an unknown source, after all due care has ben taken in soil cultivation and manuring. For the proper keeping of seed potatoes, they must have plenty of light and air. This is essential to their vitality when planted. Free from frost is not enough, but plenty of air and light must be added and without them the sprouting qualities of seed potatoes will be very much lessened. The part of the cellar that has most light in it should be reserved for seed potatoes as the final storing place in winter. It is a good plan when taking up the seed to leave them for a few hours to dry on the field before removing them to the pit or heap where they are pepared for cellar storage. Some straw or similar covering should be given them till they are ready to be taken to the cellar.

These precautions are of the utmost importance to crop production of the fololwing season. Each variety of potato has some trait in its character peculiar to itself which is a leading factor in securing the best results from the variety, but all varieties have the distinctive tendency to deteriorate if left to ripen till the advent of winter.

FEEDS THAT KILL BEES IN WINTER

In wintering bees it has always been recognized that the nature of the winter stores is an important factor in successful wintering, and the experiments have confirmed this. Experiments at the Central Experimental Farm indicate that clover honey (alsike and white clover) makes reliable stores for wintering, but poor results have followed the use of stores that granulate hard during the winter. A colony wintered on dandelion honey came out in the spring very weak; the honey had granulated hard and the bees had uncapped it but could use very little of it. In some years a mixed honey that comes largely from clover, sweet clover and other plants, granulates hard with the same result and causes heavy loss. Buckwheat honey has been found wholesome but some of the other honeys gathered in the fall have been found unwholesome, especially in marshy places in Nova Scotia, and have caused dysentery and death. In one season in Northern Ontario, the fall honey was not capped over and failed to ripen and soured, causing dysentery and heavy loss . Honey containing juices collected by the bees from over-ripe fruit killed a colony before spring, so also did cane syrup used as an exclusive food for wintering. Syrup made from refined sugar, two parts of sugar to one of water, fed to the bees in the early fall, has given fairly good results as an exclusive winter food, and has been found to be the best practical corrective ofr stores that are slightly unwholesome. Year after year at the Central Farm, colonies on natural stores that have been fed liberally with this syrup come out stronger in the spring than those that have wintered on the natural stores alone. Syrup made from raw cane sugar has given les satisfactory results than that made from refined sugar.—F. W. Sladen.

A SAVINGS ACCOUNT

It is always well to have a Savings Account upon which interest is regularly paid and from which you are free to draw at any time should you have a good opportunity to buy stock or feed. A Savings Account is Ready Money. 78A

STANDARDS FOR SHOW VEGETABLES

The following standards for show vegtables have ben adopted by the Manitoba Horticultural and Forestry Association:

Quality and uniformity, with size suitable for table use, govern all the awards.

Asparagus

Shoots should be thick, of medium length and uniform in thicknes, tender and fre from blemish.

Beans

Broad Beans—Straight, broad, well-formed pods, filled with large, tender beans. Free from disease. Size of bean and length of pod to be determining factors .

String Beans.—Pods should be long, straight, moderately broad, tender and free from disease. Pods should be uniform. Color according to the variety.

Beets

Long—Should be medium in size, smooth and free from side roots, gradually tapering from crown to tip, and firm in texture. Cross section cuttings should show fine dark red, tender flesh, free mrom white lines. Top small and compact. Roots should be uniform.

Round—Medium in size, firm flat, or round in shape, smooth, with a fine tap root. Flesh should be tender, firm. fine and of a dark red color. Roots should be uniform.

Cabbage

Early—Generally round or heart-shaped. The heads should have fair size, be heavy, firm, hard, free from insect injury or disease.

Late—Heads round or slightly flattened in shape, with a dense formation of dark green outer leaves, and inside leaves of a creamy color. Specimens should be heavy and have firm texture.

Red—Good shape (round or flat.) Dark red in color. Texture lrm and solid, with good weight. Specimens to be uniform.

Savoy—Good shape (round or flat.) Leaves close and compact, of a dark green color with a fine curl. Good weight.

Carrots

Red, long.—Roots should be long, straight and smooth, without any green at the crown; have a small compact top, be free from side roots, and gradually taper from crown to tip. Texture tender and crisp. Heart small with a large outer ring. Roots should be uniform.

Half long.—Half long, straight, free from side roots and gradually tapering, with or without blunt tip. Skin smooth . Cross-sections should show a small core and a large outer ring. Flesh should be tender and have a rich flavor. Roots should be uniform.

Short—Short, straight, of true ox-heart type. Smoothness and texture same as above.

Cauliflower

Head, large in size with a dense formation of flower, pure white in color and without small leaves in the head. Shape, round horizontally, with a nice, even, curving crown. Cauliflower should be exhibited trimmed.

FIT OUR FIGHTERS TO FARM

They Served You Well "Over There," You Help Train Them for Their Life Work Here.

The Soldier Settlement Board of Canada offers every eligible returned man who has ample farming experience an opportunity of becoming a farm owner. It is also ready to assist certain inexperienced men to learn the farming business.

Of the many thousands of applications that will be received by the Board during the next twelve months a considerable number will be from inexperienced men.

How You Can Assist Method of Training

Training centres have been established to give a limited number of totally inexperienced prospective soldier settlers preliminary practical experience. It is essential, however, that all inexperienced men complete their training by working with successful farmers who will share their experience with them.

Success Farmer: Your Opportunity

You only can assist our fighters to acquire the experience necessary to ensure their success as farmers| There is a duty devolving upon you to take as many as possible on your farm. By giving them the benefit of your experience and advice you will fit them successfully to operate farms of their own in the shortest possible time.

The Soldier Settlement Board needs and must have the co-operation of successful farmers in every Province of Canada in carrying on this work. Training allowances granted by the Board to assist in the maintenance of dependents . Will you afford the men an opportunity to gain experience? Men are waiting now. Take at least one of them for the winter.—The Soldier Settlement Board, Union Bank Building, Otawa, Ont. W. J. Black, Chairman.

A Correct Lubricant for every Farm Machine
For Gasoline Engines, Tractor, Auto or Stationary
POLARINE OIL
STANDARD GAS ENGINE OIL
For Kerosene Engines Tractor or Stationary
POLARINE OIL HEAVY
POLARINE OIL A
IMPERIAL KEROSENE TRACTOR OIL
IMPERIAL KEROSENE TRACTOR OIL EXTRA HEAVY
(Recommended by many tractor manufacturers)
For Open Bearings of Farm Machinery
PRAIRIE HARVESTER OIL
—very heavy body, resists cold, won't thin out with moisture
ELDORADO CASTOR OIL
—a thick oil for worn and loose bearings
For Steam Cylinder Lubrication, whether Tractor or Stationary Type.
CAPITOL CYLINDER OIL
—the standard product for steam cylinder lubrication
THRESHER HARD OIL
For Grease Cup Lubrication of Bearings, a clean solidified oil high melting point.
Successful Farmers are Well Posted on Lubrication
The fellows who are making the most money are usually the ones who have studied the question of lubrication, as well as other farm problems. A thorough knowledge of lubrication is worth hundreds of dollars per year on every Canadian farm.
You cannot expect service from your automobile, if it is poorly lubricated. Your tractor is poor property without proper lubrication. The two machines are unlike in structure and duties, and one kind of oil will not do for both. Be sure that you are using the oils and greases best suited for each machine and each moving part of your farm machinery.
From Imperial Farm Lubricants you can select the right oil for every purpose. All are high grade reliable products. All are correctly refined, from carefully selected crudes. All Imperial Farm Lubricants are made in Canada.
Imperial Farm Lubricants are put up in convenient sizes; one-half, one and four-gallon sealed cans, half barrels and barrels.
IMPERIAL OIL SERVICE
Our service is far more than the mere selling of our products. It follows our products to their work and insures as far as we can insure it, that each Imperial Product does the work for which it is bought. Ask the Imperial Oil man. There is one near you. His service is free and should be valuable.
IMPERIAL OIL LIMITED
Power · Heat · Light · Lubrication
Branches in all Cities

FALL PLOWING IN THE ORCHARD

(Experimental Farms Note.)

After the apples are harvested there is generally a slack time when orchard plowing can be done to advantage. Experience has indicated that shallow plowing is advisable in orchard practice and that it is unwise to go deeper than five to six inches and that the area close to the base of the tree should not be plowed deeper than three to four inches. There is as a rule little cultivation after the first of July, and from that time on even if cover crops are not grown, a natural growth of some sort will have been made. This growth when turned under affords practically as good mulch as if left on the surface, and the fact that the ground has been loosened up tends to prevent as deep freezing as if left compact, for the more compact the soil the deeper will frost penetrate it. Where root killing of trees is liable to occur, it may be wise to leave the cover crop mulch undisturbed as it assists materially in holding snow and as a result will give a better cover than if plowed in in the fall. Other than this there does not appear to be any disadvantages in fall plowing as to possible winter injury from root killing. The great advantage is that a certain amount of work is out of the way for next spring and should the spring be unfavorable for working land, the discing may be delayed much longer than it would be wise to delay plowing. Early orchard cultivation is of prime importance, and as it is usually necessary to plow once to work under accumulated vegetation, this should as far as possible be done in the fall, thus facilitating early spring work and hastening bacterial activty the next sprng —W. T. Blar, Supt, Expermental Staton, Kentville, N. S.

Minard's Liniment Co., Limited.

Gents,—A customer of ours cured a very bad case of distemper in a valuable horse by the use of MINARD'S LINIMENT.

Yours truly,
VILANDIE FRERES.

DAIRYING

COURTING THE COW'S MILK FLOW

Never hurry a cow or strike her or speak loudly or harshly. A gentle voice and a caressing touch are quite as potent as is digestible protein. If you so handle the cows that they are fond of you, you have learned one of the most important lessons that lead to profitable dairying. The most successful milk-producers are always in close touch with every cow in the herd. The mik-producer has to do with motherhood, in which affection always plays an important part. A cow's affection for the calf prompts the desire to give it milk if you gain her affection she will desire to give you milk. If you have not been in the habit of caressing the cows, the time to inaugurate the practice is when they approach the time of calving, as it is at that particular time when they take kindly to grooming and to gentle rubbing of the udder.

CARING FOR MILK AND CREAM

When milk or cream is allowed to cool naturally the process takes considerable time, and the material retains a great deal more animal odor, and so develops acid more quickly than when artificially cooled. Setting the cream can in a tub of water is too slow in effect; every dairyman should have a water cooler. Creamed cooled by water cooler as it leaves the separator has shown only 0.2 per cent, of acid in two days, while uncooled cream of the same origin has shown as high as 0.7 per cent. Cooled milk delivered in the cities is often 36 to 40 hours old before being consumed. Suppliers of milk to our cheese and butter factories often experience difficulty in keeping the evening's milk when it is uncooled until next morning, a period of about 16 hours.

Engine and separator in the same room.—This condition should not be allowed. Moreover a single partition between the two parts of the plant is not sufficient. A double partition is required, with openings to outer walls, so that fresh air can blow between the engine room and the separator room. Where a kerosene blow lamp is used in the same room as the separator it is found to almost invariably cause second grade cream. The milking machine releaser should be in the separator room. Milk should not run through the engine room in an open chute.

Failure to clean vacuum tank and vacuum pipes of milking machines.—In a number of machines the air required for pulsation is discharged into milk, also the action of the vacuum pump is intermittent; therefore any foul smell in the tank or pipes is carried into milk. Essential attention is required to be given to the pipe between the releaser bucket and the vacuum tank. The vapor from the milk is carried into this pipe and condenses, and if the pipe is not cleaned daily it soon gets very foul. All right angle piping should be coupled with cross sockets so that a brush can be run through the pipes in both directions. Leave the vacuum tank open between milkings.

Lack of ventilation in separator room.—To remedy this condition air should be brought in at the bottom and let out at the top, bird netting being put over the openings. Just as is the smell in the dairy, so is the smell of the cream when delivered. If there is no ventilation in the dairy the cream cannot fail to take up any smell. A window at one side with a door on the other side is not sufficient as a certain amount of dampness is always found below the level of the window. Pollard, calf meal. harness, milking overalls, etc., impart their smell to cream; nothing but dairy utensils should be kept in the dairy. If cream is removed after separating in an impure atmosphere the effect is not so bad as when it is left to stand under such conditions, but the same damage is really done when the cream is leaving the separator.

Muddy surroundings.—Cows should not be allowed to come near the separator room. More or less smell always arises from muddy surroundings. It is well nigh impossible to milk cows without ever making mud, but it is possible and only a matter of arrangement to have no mud around the separator room.

If a dairy farmer neglects to carry out any one of the foregoing five factors it is not possible for him to deliver milk or cream as good as the cow gives it to him. I have met with dozens of cases where individual farmers were carrying out all but one factor and yet had second grade cream. By attending strictly to these five essentials, it will be only an accident if the farmer gets second grade product.

BEST QUANTITIES OF CONCENTRATES FOR DAIRY CATTLE

Experiment at Cap Rouge.—Twenty seven cows were used, and the experiment was run for five seasons, during an average of 143 days per year, starting at the beginning of November. Animals were chosen of nearly the same weights and production, and they were all given the same quantities of roughage. One lot received as much meal as would be eaten clean, which came to one pound per 2.18 pounds of milk, another one got one pound of meal per 4 pounds of milk, and the last bunch one pound of meal per 8 punds of milk. No attempt was made to adjust the quantity of meal for each cow in a certain lot, as there was not enough difference in the percentage of fat to warrant doing so.

More Meal ment more Milk.—One result was very clear; that the more meal was fed, the more milk was given. If the quantity produced by the lot getting one pound of meal per 8 pounds of milk is taken as 100, that produced by the lot getting one pound of meal per pounds of milk would be 111, and that produced by the lot getting one pound of meal per 2.18 pounds of milk would be 128.

Act according to local conditions.—The valuations were as follows: Hay $14.00 per ton, roots and silage $4.00 per ton, meal 2½ cents per pound, butter 60 cents per pound, skim milk 50 cents per 100 pounds. The results showed that if the profit from the cows getting one pound of meal per 8 pounds of milk is taken as $1.00, it was 1.01 for the ones getting one pound of meal per 4 pounds of milk, and $1.07 from the ones getting one pound of meal per 2.18 pounds of milk. However, each farmer must see for himself, acocrding to prices in his locality, if it will pay him, or not, to feed meal heavily to his dairy cattle.—GUS. LANGELIER, Supt. Experimental Station, Cap Rouge, Que.

ENGINES IN DAIRY

A great many dairymen would save much time and labor and make more money on their farms if they would employ more up-to-date machinery. This is especially true as far as power is concerned. On farms where the cream separator, churn, etc., are operated by hand the value of the gasoline or oil engine is surely unknown. The engine has advantage over practically all machinery since it will run a number of different machines at smal expense and do the work of from one to a dozen men. It is ready for work at any time, day or night, and never gets tired. It adds much more efficiency to the machine or machines to be operated than hand or animal power and does its work evenly and steadily. It is easily operated. The women folks can run it as well as the man.

An engine will run the separator and other machinery much better than can be done by hand and do the work so cheaply that the cost of operation can hardly be considered.

One may think he hasn't enough use for an engine to warrant his buying one but after a man buys an engine the more he uses it the more tasks he finds that it is capable of doing. The first cost of an engine is small, considering its value, and with good care it will last and give good service for years. There are many different makes on the market. Any reliable manufacturer puts out a good engine but before buying get the business literature from the different manufacturers, as such literature is very helpful to a prospective purchaser in making a suitable selection.

Cletrac

TANK-TYPE TRACTOR

Does the Belt Work on the Farm

THE Cletrac not only does all the "pulling" on the farm better and faster and cheaper than horses, but it will take the place of a gas engine as well.

20 h p. on the belt pulley to fill the silo, saw wood, chop feed, mix cement. Steady, economical power which adds greatly to the usefulness of your tractor.

The Cletrac works more days in the year. It does the plowing—does it well and quickly. But it follows up. It does the discing, harrowing, seeding, harvesting.

Laying its own track, the Cletrac travels over all kinds of ground, going in all kinds of weather.

It eats up your work at 3 to 3½ miles an hour.

There are a lot of things that you want to know about tractor farming which you will find answered in our 32-page illustrated book "Selecting Your Tractor." Write for it to-day. It's free.

Gentlemen:
After seeing the Cletrac Tractor pulling 3 ten-inch plows on my farm upon which a horse could not work on account of the wet condition of the soil, I came to the conclusion that beyond a doubt the Cletrac was the best all-year-round Tractor on the market. I have absolutely no trouble whatever.
Wishing you success, I am,
Very truly yours.
Norman Counsell.

Ottawa.
1st September 1919.

Dear Sir Herbert,

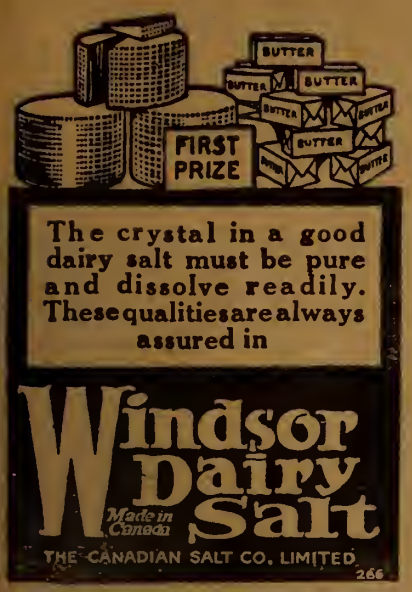
I am pleased to be the holder of a Canadian War Savings Certificate. I am delighted to find that in Canada you have War Savings Stamps on sale, similar to those we have in England.

I wish the War Savings campaign every success.

I remain
yours sincerely
Edward P

Sir Herbert B. Ames,
Chairman,
National War Savings Committee,
Ottawa.

Facsimile of the letter sent to the Chairman of the National War Savings Committee by His Royal Highness the Prince of Wales, at the time he purchased in Ottawa a Canadian War Savings Certificate containing the full number of ten War Savings Stamps.



HOW MILKING SHOULD BE DONE TO GET THE LARGEST MILK FLOW

Do not go near the barn at milking time if your temper is anyway ruffled . Wait till you cool down a bit and it will pay you. Remember that the first act towards the process of milking takes place when the milker takes his pails and heads for the cow stable. When doing this he should at the same time throw off any grouch that he may have in mind, forget any anger he may have stored up, put on a bright, round face, and not think how hot the air is, or this current of heat in him may ignite with some fault of the cow he approaches and set the dogs of war loose.

Calmness and kindness is a good help for the person who milks. No one should dare or take chances of walking up to a cow and touch her before sounding a warning of his approach. The cow has light feet and even though her hoofs are split she can spot a man fairly well just as the horse, if not warned of his nearness at which she suddenly frightens. It is easy to say a word or two when going near a beast of any kind thereby letting it know of one's presence so that a touch wil not scare it. Especially should this be done in the task of milking. Of course, if a cow sees a person coming and is used to being milked, she may understand what is to happen, but she understands kind words. Why not speak her name or such like saying, "All right Tulip, you'll get milked now." "Here Pinkie, you're next." Then touch her on the body before sitting down and touching the udder. If there is any dirt that might get into the bucket it should be brushed or washed off, carefully and clean.

Fast and Slow Milking

Contrary to the opinion of many, nothing is gained by fast milking. Of course a slow milker gives a cow the itch and she doesn't care to stand all day for him. So we strike a happy medium, neither too slow nor too fast. When one first begins pressing out the fluid, he should go easy, having first slipped the thumb and forefinger lightly over all four teats to see whether any cuts or scratches may be present. If so go easy, press lightly and keep coming a little harder. A cut should be placed to the palm of the hand if possible so as not to irritate and crack it open. The quarters of the udder are best emptied alternately, that is, one of the side in front and across from the other. By doing this the milker's hands do not interfere with one another, nor does it jerk the halves of the udder as it would by milking on one-half with both hands.

If a person milks at a moderate speed the cow will not be liable to move about. A nervous cow should always be freed of her udder full slower and easier than a gentler one. The milker who sits down, grabs the teats, goes to tearing away like he had to get done before he puts all his weight on the stool, chances to sit watching his victim walk away from him. On the other hand, no one should sit under a cow long enough to go to sleep. The milker must bear in mind that a cow has feeling especially for on the udder. She may not stand well if her bow of milk is heavy and the udder is shaken too fiercely. After it has been emptied a little there is not much difference in the speed. The medium fast milker takes the prize. All the cows lick his sleeve.

The correct procedure to milk is to have the cows fastened at milking time the year through. Then no walking off or backing away can be done. In all, time is saved instead of lost, by fastening them as they become accustomed to their stall and know what to do . A box of salve should occupy a handy place in the cow stable, so that it can be applied to scratches or sores that may be detected. There is always a reason to cause an animal to kick.

Whether a heifer will make a good cow depends to a great degree upon how she is handled when first milked. She must be treated kindly, yet with firmness. Speak calmly, press the teats lightly, pet her some on the back. A club should be as scarce as sun after dark around the cow stable. Many cows are made nervously hopeless for life by some irate idiot who can't hold his temper long enough to learn what may be the cause of the beasts not wishing to stand. A cow always makes one think of the sign posts, "Go slow, danger."—D. W.

Bright Prospects

It looks as though the demand for beef will be strong for some years to come, and the man who is in line for greatest profits is the Shorthorn Breeder.

We haven't room to give our reasons here, but write the Secretary for our free publications, which furnish facts.

REMOVING THE IMPURITIES OF MILK

Although emphasizing that clean milk depends primarily on sanitary methods of production, dairy specialists of the United States Department of Agriculture report that milk strainers as commonly used also have a direct bearing on the quality of commercial milk . Certain kinds of strainers cause milk to appear clean, but fail to remove all impurities. Of all the milk filters in common use, only two—absorbent cotton and filter cloth—are seasonably efficient, according to the department, in actually improving the commercial quality of milk. Even these filters must be kept clean and changed frequently to insure satisfactory results.

The officials further state that wire-gauze strainers are in most general use than any other kind, but their studies with the microscope show plainly that the meshes are much too large to hold back any but the very coarse impurities. One thickness of cheese cloth or other cotton cloth is only sightly more effective than a wire-gauze strainer, but when the cloth is folded to about eight thicknesses its ability to remove dirt in milk increases somewhat, but is still inefficient as compared to absorbent cotton or filter cloth.

Filter cloth, a specially made cotton cloth, smooth one one side and "fuzzy" on the other, was found reasonably effective. This cloth can be obtained from leading dairy supply houses. The milk should be poured on the fuzzy side, the fibers of which stand up like the nap of a carpet and remove all but a small percentage of the solid impurities. The most effective strainer of all, however, according to the experiments, was a lay r of absorbent cotton placed between two layers of cheesecloth.

At best, straining milk is a practice that makes milk appear clean, and therefore, more easily salable, but no strainer removes either the bacteria and objectionable flavors or the very fine dirt. As a consequence, straining milk fails to improve its wholesomeness to any noticeable degre. Clean milk is best obtained by sanitary methods which prevent, so far as possible, the entrance of dirt into the milk. This can be done best by having clean cows in a clean stable and milking with clean hands into sterilized small-top pails.

Service

THE ALPHA Gas Engine is built for service. It does its work, without coaxing or tinkering.

Trade Mark

The construction and workmanship employed in building it are so excellent that it will continue to render good service for many years.

The ALPHA is sold by local agents, especially selected for their ability to render service, and the De Laval Company is well known throughout Canada for its many years of unfailing service to its customers.

Branch offices are so located that every part of the country is covered by De Laval service.

If you don't know who handles the ALPHA in your vicinity, write nearest sales headquarters for his name.

Encouraging the Sheep Industry

INDUCEMENT TO USE A PURE BRED RAM AT THE HEAD OF YOUR FLOCK OF SHEEP

The New Brunswick Department of Agriculture are Co-operating with the Dominion Live Stock Branch in Encouraging the Use of Pure Bred Rams

Persons Eligible

Any sheep raiser who purchases a pure bred registered ram and who has not before at any time used a pure bred ram in his own flock shall be entitled to a premium of ten dollars the first year; Five of which will be paid by the New Brunswick Department of Agriculture and five by the Dominion Live Stock Branch, and an additional premium of Five Dollars the second year, payable by the Live Stock Branch. Applications for premiums to be sent in to Live Stock Division, Department of Agriculture, Fredericton, not later than Dec. 1st.

Co-operative Purchasing of Pure-Bred Stock

The Dominion Live Stock Branch will pay the travelling expenses to any point east of Fort William, Ontario, of any accredited man appointed by a Society, group of Societies or group of farmers who have orders to purchase at least twenty-five pure bred rams for farmers never having used a pure bred before . This same person has the privilege of making purchases of other live stock or rams for any farmer while on the trip, so long as the minimum of twenty-five rams are purchased as outlined above.

Grading of Pure Bred Rams in New Brunswick

The services of Professor Sackville of Ontario Agricultural College, have been secured to visit each pure bred breeder in the province and classify the rams offered for sale into three grades, superior, average and common. By purchasing your rams in the province, farmers can write any breeder of pure bred sheep and be sure of getting the class of ram he applies for. New Brunswick is the first province to adopt this classification system. Breeders and Purchasers stand to gain by it. The number of rams for sale together with the price and grade will be listed with the Local Live Stock Division.

Boys' and Girls' Sheep Clubs

In order to create a deeper interest among our farm boys and girls in the business of sheep raising, arrangements have been completed to organize Sheep Clubs in the province. Members must be between the ages of ten to eighteen years. Ten members will constitute a Club. Two grade Shearling ewes will be the number alloted to each. Members can get credit from any bank for purchase price of sheep for one year at 6% interest. The Department will arrange a fair at which prizes will be given. The Department will loan a pure-bred ram to any Club with twenty ewes.

For information on any of the above policies write

Hon J. F. Tweeddale,
Minister,
FREDERICTON, N. B.

HAMILTON FACTORY DISTRIBUTORS CANADA

SCRUB BULL CAMPAIGN IN ONTARIO

For some months past the Ontario Department of Agriculture has been giving considerable attention to the study of live stock improvement in Ontario. In this connection the agricultural representatives of the Department were instructed to make a survey of the number of scrub bulls in their respective counties and have confirmed our former opinion as regards the use of grade or scrub bulls. While some counties are almost free from the use of scrub bulls a great many of them range anywhere from 15 to 30 per cent. and in quite a number of cases the percentage runs as high as 75 per cent. or 80 per cent.

In view of the conditions as above stated the Department has decided to make a special effort to interest the owners of grade sires in the breeding of better stock and assist them in securing bulls of good breeding and quality at reasonable prices. The first step in connection with this campaign will be to have the agriculutral representatives make a complete census of all the bulls in their respective counties in order that we may have accurate information of the used together with their breding, etc. They will also be instructed to make a census of all the pure bred breeders of live stock similar to the one conducted in 1914. Lists will include the names of all the breders of pure bred stock together with the number of breeding animals and the name of the sire used. We feel that it is very important to have the name of the sire as it is usually a fair indication of the class of stock the farmers breed. The publicity in connection with this campaign will be in the hands of Professor Wade Toole of the Ontario Agricultural College.

R. W. Wade, Director of the Live Stock Branch of the Department will have charge of the purchase and distribution of bulls. The agricultural representatives are to organize pure bred bull clubs and through this organization an effort will be made to interest the members of the clubs in community breeding and have as possible purchase bulls the same breed. Each member will submit the breed of bull he wishes to secure, together with age and maximum price he is willing to pay. This order will be forwarded to the Live Stock Branch and bulls purchased within the county if possible and if not in adjoining counties and shipped to a central point and distributed to the members of the club.

During the winter months an effort will be made to interest the club in live stock breeding, feeding, etc., through the use of motion pictures, lecturers, circular letters, bulletins, etc. It is also hoped that the club will serve as amedium for exchange of bulls later on.

The Department is working in close co-operation with the Ontario Cattle Breedrs Asosciation and will have their assistance in locating bulls, encouraging the organization of clubs and also in interesting the pure bred hope that they may be prepared to offer animals at reasonable prices, having in mind future business.

The Department fully realizes that this problem is not an easy one and not likely to meet with immediate results. However, the more general use of pure bred sires is of great importance to the live stock industry of the Province and for that reason every effort will be made tao make the campaign as effective as possible.

WORMS IN PIGS

Recent investigations have shown the importance of taking special precautions with newly farrowed pigs to prevent their becoming infested with intestinal worms. Intestinal worms are very common parasites among pigs, and cause a great deal of damage to the young animals. It appears that as they become older, pigs become less susceptible to infection. Accordingly, if pigs can be protected from infection during the first few weeks of life, they are less likely afterwards to be seriously injured by intestinal worms of the common variety.

How Pigs Become Infested

The worms are spread by means of eggs of miscroscopic size which are deposited by the adult worms in the intestines of infested pigs, and which pass out of the body in the feces. After a period of incubation, which varies according to temperature and other conditions, the egg contains a tiny embryonic worm, and is ready for further develoment when swallowed by a pig. The egs are highly resistant and may retain their vitality for years. It is, therefore, evident that in course of time the ground in yards where pigs are kept may be-

Correct Proportions

KEEP your stock active, keep them working, tone up their system, purify their blood—keep them in trim with Canadian Pioneer stock food.

Stock in Winter quarters lose out on the natural food elements—green feed—green stuffs—they require a stock food that contains the correct proportions of protein, fat and carbohydrates to keep them from running down or getting off their feed. Quantity of food is not the big question, it is the food value of the amount given them that counts the most.

Canadian Pioneer Stock foods are scientifically balanced to give the proper results.

come very heavily laden with the eggs of the worms.

When the eggs are swallowed, the young worms hatch out, but do not immediately settle down in the intestine. They get into the circulation and are caried to various organs of the body, including the lungs. Meanwhile, they increase somewhat in size and undergo certain changes of structure. In a week or 10 days they can be found in infected pigs examined post-mortem crawling up the windpipe into the mouth and down the esophagus into the stomach. In the normal course of events they finally reach the intestine again, where they develop slowly to maturity. The worms as they are found in the lungs and windpipe are still very small, microscopic in size, and are not to be confused with the larger lung worms, which are easily seen with the naked eye. Small pigs, if their lungs are invaded by large numbers of the young intestinal worms are liable to develop pneumonia, which may prove fatal. It is not improbable that many cases of lung trouble among young pigs are caused by these worms.

Important to Protect New Litters

In view of the discoveries concerning the mode of infection with the common intestinal round worm, the damage caused by the young worms as they migrate through the lungs, and the great susceptibilty of very young pigs to infection, the special importanve of protecting newly farrowed pigs from these parasites is evident. It would seem that the chief source of infection in the case of young pigs is the dirt-soiled skin of the sow. Small particles of dirt from the pig pen adhering to the skin of the sow may contain thousands of worm eggs . Little pigs, while suckling, may thus swallow not only their mother's milk, but also the worm eggs present in the dirt adhering to the teats of the sow.

The question of preventing losses among young pigs by worms, judging from the results of the investigations carried on in the Zoological Division of the Bureau of Animal Industry, largely resolves itself into a question of providing good sanitary conditions for the pigs, particularly during the suckling period. The sows before farrowing should be kept in clean dry places away from mud wallows, and until the pigs are several weeks old they should be kept preferably in buildings with floors which can be easily cleaned and which are kept clean.

HIGH POLISH FOR BRED CATTLE

Breeders must realize the importance of proper feeding and grooming, as well as keeping the animals free from insects and vermin. Cattle that are fed roots and silage along with their dry roughage and grain feeds will develop plenty of oil in their coats to give them a healthy, sappy appearance, if given proper grooming with a coarse brush. If one lacks these succulent feeds a little oil meal added to the ration will work wonders in stimulating a healthy condition of the skin and promoting a fine growth of hair. An occasional grooming will keep the pores of the skin open and give the animals that fine bloom of condition so difficult to define, yet highly prized among good judges of live stock.

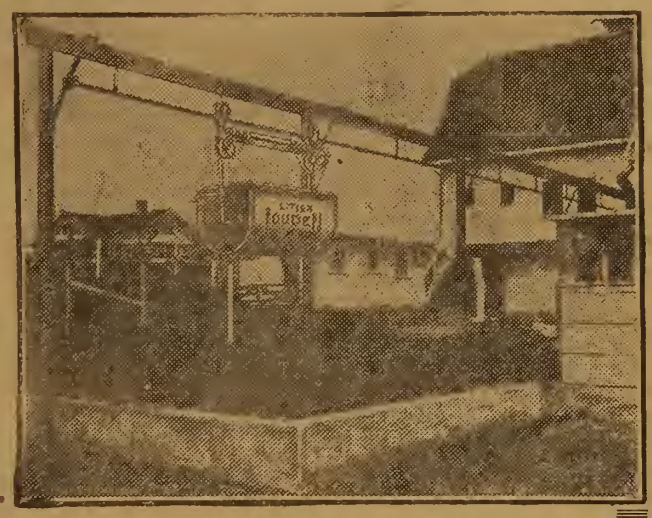
Insects and vermin are not difficult to hold in check where proper attention is given to bedding and sanitation. Hogs require more attention than cattle, but will keep practically free from these pests if provided with clean nests and patent oiling apparatus, or posts covered with old sacks saturated with comercial dips or the home made remedies. A pure bred boar put in a filthy, lousy pen and allowed to run down in flesh condition is harder on sore eyes than the scrubbiest kind of scrub. The latter is habituated to living under such conditions and taking care of himself, while the pure bred is entirely dependent upon thoughtful care . Failing to receive it, his skin becomes a fine feeding place for insects and vermin, and "he goes to pieces."

LOUDEN

LITTER CARRIERS DO THE CHORES IN HALF THE TIME

Life is too short nowadays to clean the stables with the old out-of-date, labor-wasting, back-aching wheelbarrow.

Louden's roller bearing litter carrier will help you—keep your stables and yards sanitary—produce sanitary milk—do the chores in half the time—keep the boys and hired man satisfied **—every day in the year for years to come.**



Louden's double beaded rail steel track —carries two tons — hangs from centre — no side strain or warping—easy to erect.

Roller bearing track wheels—easiest to push under heaviest loads—no brakes—ratchets—clutches—to get out of order—absolutely safe—one pound pull lifts forty pounds in bucket—heavy galvanized steel end all steel bucket—water tight—acids cannot rot or corrode—carries three or four barrow loads, and a ten-year-old boy can handle it.

Discard your wheelbarrow—Best investment you will ever make.

MADE IN CANADA BY US FOR A GENERATION
THOUSANDS IN USE

Mail us rough sketch of layout of your stable, giving—length and width—number of beams, with width and thickness below ceiling—show where you want track to run.

We will return complete list of fittings required to equip with Louden outfit complete.

You will be surprised how little a really high grade outfit costs.

If you are going to build or remodel, write for our large 112-page barn plan book—not a catalogue—its free—also our large illustrated catalogues.

WAR ON THE SCRUB BULL

At the recent session of the Nova Scotia Legislature an act for the encouragement of the improvement of live stock was passed. This Act makes provisions under which a penalty may be imposed upon anyone owning or harboring a scrub bull and offering the same for public service within an Agricultural Society District.

In the generad amendments to the statutes provision is made for defining Agricultural Society Districts which, briefly, may be done at any meeting of the agricultural society regularly called, at which a by-law to be subsequently approved by the Governor-in-Council, may be passed in respect to these boundaries.

SILAGE TEN YEARS OLD

The fololwing was taken from the National Wool Grower of July 1919:

"A silo was recently opened up in Austria, that had been filled with corn in April, 1909, just ten years ago. It is reported that the silage was in excellent condition and was eaten by the stock with great relish." Silage is an insurance against feed shortage.

Silage is necessary in the ration of the dairy cow. It takes the lace of grass.

Business lies always come home to roost.

The Why ? of Ano

WHEN, on the morning of November 11th, 1918, the guns were hushed and glad tidings flashed across the world, there followed with the Nation's Prayer of Thanksgiving, one yearning query, which found echo in the faster-beating hearts of wives, mothers, fathers, brothers, sisters and sweethearts.

THAT query was, "How soon will our boy be home ?"

AND, from France and Flanders, from Italy and Egypt, from Palestine and from far-off Siberia, there came an answering echo, "How soon, how soon, may we go home ?"

CANADA caught the spirit of these longings, and at once resolved to satisfy them.

IT was an appalling task. Shipping was tragically scarce. The composition of the Army of Occupation had not then been settled. And other parts of the Empire

Need Divides Itself in Two Parts

The answer to the question "Why does Canada need another Victory Loan?" divides itself into two parts.

(a) To finish paying the expenses of demobilization, and the obligations we still owe to our soldiers.

(b) To provide national working capital.

* * * *

Obligations to Soldiers

The obligations to soldiers include:

That already incurred cost of bringing home troops from overseas.

The payment of all soldiers still undemobilized. This includes more than 20,000 sick and wounded who are still in hospital, and who of course remain on the Army payroll till discharged.

The upkeep of hospitals, and their medical and nursing staffs, until the need for them is ended.

These three items alone will use up at least $200,000,000 of the Victory Loan 1919.

Gratuities

There is also the gratuity which has been authorized, and has been and is being paid to assist soldiers to tide over the period between discharge and their re-adjustment to civil life. For this purpose alone, $61,000,000 must be provided out of the Victory Loan 1919, in addition to the $59,000,000 already paid out of the proceeds of the Victory Loan 1918.

Land Settlement

Furthern may, und ed money by Canada with which to pur so advanced will be paid back; meantim Up to August 15th, 29,495 soldiers had and 22,281 applications had been inve cant approved. For this purpose Canad

as well as Canada were looking for the speedy return of their men.

THE problem was this. The half-million men that Canada had overseas had taken more than four years to transport to the field of battle.

TO bring them home in a few months was a gigantic undertaking—one to tax all Canada's ingenuity and resources.

CANADA solved the problem, but it meant crowding into a few short months, an expense for demobilization which it was impossible to foresee.

THEN, too, besides the sentimental aspect of the necessity for bringing the men home quickly, the economic side could not be overlooked.

THAT was, to transform efficiently and speedily the nation's army of fighters into a national army of workers.

't pay cash?"
ly essential to the continuance of our

nount of employment thus created, will
an 1919.

The "Why" of Credit Loans

Farmers and manufacturers (and that includes the workers on these orders) must be paid cash for their products. Therefore, Canada must borrow money from her citizens to give credit, temporarily, to Great Britain and our Allies. Actually, no money will pass out of Canada.

If Canada does not give credit, other countries will; and they will get the trade, and have the employment that should be ours, to distribute amongst their workers. And remember, we absolutely need these orders to maintain employment. If we don't finance them business will feel the depression, employment will not be as plentiful, and conditions everywhere will be adversely affected.

For Transportation

Money must also be available to carry on the nation's shipbuilding programme, and other transportation development work.

For loans to Provincial Housing Commissions who are building moderate priced houses.

These, then, are some of the things for which Canada needs national working capital. She is in the position of a great trading company, and her citizens who buy Victory Bonds are the shareholders.

THE HORSE

HORSE DISEASE FOLLOWS FULL CHANGE FROM PASTURE TO CONFINEMENT IN BARN

The season has again come round when the farm work horse has to leave the open life in the pasture for the confinement of the stable. The change is always a fertile cause of sickness among horses. Providing the conditions in which a horse thrives best will prevent many of the ills that the average farm horse is heir to, and will kep him in the fittest form to give cheap and efficient motive power. The horse in his best and highest form is the native of a dry, warm, sunny country. He loves both warmth and dryness. In damp stables he loses all life and spirit and debility followed by disease soon takes place.

Bad Effect of Sudden Changes

A fact, not generally observed by the average horse owner, is that horses rarely suffer in health from a change even suddenly from warm to cold stables, provided they are dry; but a change from cold to warm stables generally produces coughs and colds.

In like manner horses turned out to grass from warm stables seldom catch cold, whilst those brought into warm stables from the open, almost invariably suffer. When horses, which have been lying out at grass or in the open yards, are brought into stables, every door and window should for many days be left wide open, and the temperature should only be slowly and gradualy increased, and during this transitional period any symptom sof disease should be carefully watched for.

The horse thrives best and puts on flesh in warmth his food will go further and his coat will look better in a warm than in a cold stable. But in making the stable comfortably warm care must be taken that it is not close and offensive. Warmth is good for horses but purity of air is more essential. Good air must never be sacrificed to warmth. Foul air is the ready partner of disease.

Stable Temperature

In a well drained, well paved, well ventilated and cleanly kept stable the temperature may generally be maintained at from fifty to sixty degrees. Ill dained, ill paved, badly ventilated or dirty stables cannot with safety be kept as warm as those of which the sanitary condition is more favorable. It is quite possible also to have a stable both cold and close. Such stables are generally also damp. They are most objectionable and are a constant source of disease.

The best test of the purity of air in a stable is the sensation felt on first ging into it from the external air. The best time for testing the sufficiency or otherwise of ventilation is the early morning, before the stable has been cleaned and aired.

In the spring and fall the temperature or heat of most stables is several degrees higher than that of the open air; in winter it is frequently more than thirty degrees The effect of this is to weaken and exhaust the energies of parts most exposed to the influence of these changes, and they are the lungs. Few things can be more injurious to the delicate membrane that lines the cells of the lungs, than the sudden change from cold to heat, to which, under the usual stable management, the horse is subject. It is, however, not only heated, but empoisoned air that the horse breathes; composed of his own contaminated breath, and of vapors from his manure, particularly from his urine, strongly impregnated with ammonia, painful to the eyes and irritating to the chest . He that would have his horses free from disease, and especially free from lung disease, should have his stables dry, cool and clean.

Causes Lung Disease

There is also an intimate connection between the lungs and the function of the skin. The perspiration, whether sensible or insensible, is suddenl ystopped by taking a horse suddenly from a heated conditioon to that of biting cold air. Colds and coughs are the first consequences. The discharge from the skin is at once arrested, and the effect of the sudden stoppage of a natural evacuation falls on the lungs, too much weakened, and disposed to inflammation by heated air and poisonus fumes. Simple observations like these are pregnant with interest and instruction, and no horse owner or caretaker is capable of looking after horses if he remains blind to the effects of these changes. No matter how careful he imagines he is in regard to all other details, such as feeding or breeding, disregard of the general conditions which the changes of seasons bring, will fetch him loss and disaster. There is no animal among all those that man has subdued that, previous to his breaking in, is so free from disease as the horse(and there is no animal which, after he has been broken to service, is so liable to disease, and especially that of the lungs. This result is largely due to the stable management, and the fall season is the one which the greatest care has to be exercised. Influenza is one of the diseases that fol-

Day in and day out, the hard work of cleaning the stable has to be done. Stable cleaning with a wheelbarrow is a monotonous, hard, disagreeable chore. It is hard to wheel a heavy wheelbarrow load through a muddy yard and up a slippery plank. And the worst of it is, this hard, disagreeable chore has to be done every day.

It is practically an impossibility to get the manure far enough away from the stable. The conditions in the yard make it impossible. Manure piles right up close to the stable give off ammonia fumes that spoil paint and woodwork, rot harness and at the first opportunity breed flies.

A wheelbarrow does not hold much at a load, which means many trips before the work is done. The BT Carrier holds three times as much as a wheelbarrow. It will tackle 800 lbs. in one load.

The hard work of cleaning the stable is cut in two with a manure carrier. It runs on overhead track so it does not matter about the state of the yard. No planks to lay; no snow to shovel; no more pushing to the top of the pile with a wheelbarrow.

If you want to dump the manure sixty feet away from the barn you can do it easily. No more manure piles at the stable door. The BT Manure Carrier is loaded, run out and dumped in a jiffy. A boy can do the work.

With a BT Carrier there is no muss in the passage ways. The big steel bottom bucket holds every bit of the manure including the valuable liquid. With a wheelbarrow, the manure slops over and the passages beccme filthy.

Help is scarce and you have much to do. Another hour to yourself and relief from the drudgery of the hardest chore on the farm would be much appreciated, would it not? Let us send you our free book on Manure Carriers so that you can judge for yourself.

low bad ventilation in buildings. It is caused by the introduction into the system of a poison that has its origin in the atmosphere .

Barns that are Hotbeds of Disease

All anlimal life reqires oxygen in the system to enable them to resist disease. In close and badly ventilated buildings this natural operation is restricted and the inmates are a prey to disease. The disease is infectious and contagious, passing from one to another.

Where disease begins to appear among the inhabitants of these ill-ventilated places, it is not at all wonderful to find it spreading rapidly. These barns become plague spots. When distemper appears in the fall and early winter, it is in very many cases to be traced first of all to such a pest house. It is peculiarly fatal there. Nothing is more certain, than that the majority of the maladies of the horse, and those of the worst and most fatal character, are directly or indirectly attribuited to the unnatural heat of the stable, and the sudden change of the animal from a high to a low, or from a low to a migh temperature. Horse ills and veterinary bills will be avoided if the pure air conditions that give the animals health in summer, were strictly attended to in their domesticated life at the barns in winter.

CURATIVE TREATMENT OF HORSE MANGE

Before the war horse mange attracted the attention of practicians in a limited measure only, on account of easy treatment and the facility of prophylactic measures, but, during the war, it assumed such proportions in all armies, that it alons gave more work to the veterinary surgeons than all the other diseases put together.

As the author had the opportunity of treating a group of 300 horses, he proposed to find the experimental answer to the following questionns: (1) Does a remedy exist that can prevail absolutely over the others? (2) Which treatment is preferable from the standpoint of economy and rapid action. (3) Can horse mange be cured by an exclusively mechanico-detersive treatment, without the intervention of any medicament?

The treatment consists in:—dipping followed by washing twice all over with 5% sodium carbonate solution; carefully cleaning the epidermis; curative treatment (5 applications at successive intervals of 4, 5, 8, 13 days) with the mange remedy tested (which, for the different groups of animals was one of the following:—creoline; phenolised extract of tobacco; sodium hyposulphite and hydochloric acid; soap solution of formol; sulpho-acaline soap; Helmerich pomade; mericurial ointment); currying; douches; cleansing and disinfecting of stables, etc.

Six weeks after beginning of treatment (i. e., after 5 applications), 20% of the animals were cured; this percentage belonged mostly to the groups treated with pomade; the rest of the animals received 2 or 3 applications of Helmerich's pomade or mericurial ointment, or simply melted horse fat and were then washed all over with the phenic extract of tobacco. After 20 days, 50% of the anima's, that were still affected were cured and, after two and a half months the malady had entirely disappeared.

Conclusion.—(1.) Of all the mange remedise tested by the author there is no one that is absolutely superior as regards its therapeutic efficiency.

(2.) In the case of severe mange of long standing, the best treatment is the mixed one, consisting in the use of a watery solution and a fat, while in less severe and recent cases, a simple watery solution suffices, e. g., phenic extract of tobacco manual care should be considered as an integral part of the treatment.

(3.) A simple mechanico-detersive teratment (very diilgent manual attention, washing with water, and, in the graver cases where this treatment does not suffice to detach the epidermal crusts, annointing with horse fat) suffices to cure mange, no matter how serious or of long duration it may be. —Torti, E., in Il Nuovo Ercolani, Year XXIII., No. 19, pp. 241-250. Turin, 1918.

MISCELLANEOUS

Vetreinary Editor: (a) Could you tell me what to do for a mare that sprained the cord on the back of her hind leg? I have blistered her some, but the cord is very large yet. Will it hurt her for work if she does get better?

(b) I have a three year old mare that a boy hit in the eye with a hard piece of dirt about two months ago and now there is a white scum on about one-quarter of her eye. Is there any danger of her going blind, and what would be good to do for her? She is a purebred mare.

(c) I have a mare with the mud itch or clyd eitch. She kicks in her stall. Is there any cure for her,

(a) enlarged tendons are vry hard to reduce. If she be still lame, blister again. If not, get a liniment made of 4 drams each of iodine and iodide of potassium and 4 oz. each of alcohol and glycerene, and rub some well in once daily. Have patience and continue treatment, as results will not be quickly noticed. Working will not injure her after lameness disappears.

(b) This is caused by a deposit of lymph between the layers of the cornea. Get a lotion made of 10 grains nitrate of silver in 2 oz. distilled water and put a few drops into the eye twice daily. This should gradually cause absorption of the exudate and clear the eye, but in some cases it cannot all be removed.

(c) Get a solution of corrosive sublimate, 30 grains to a quart of water. Heat a little of this to about 110 degrees Fahr. an drub well into the skin of the legs twice daily until itchiness ceases.

All animals require plenty of good, pure water. This is especially true of the milking cow, as water constitutes more than three-fourths of the volume of milk. Stale or impure water is distasteful and she will not drink enough for maximum milk production.

Horsemen Attention !

Dr. J. Woodbury's Horse Liniment and Dr. J. Woodbury's Condition Powders will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as Cough, Colds, Distemper, Spavins, Pinkeye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING

Why have a sick or lame horse, when you can get a reliable and warranted remedy? The leading horsement of the Dominion endorse Dr. J. Woodbury's Horse Liniment.

Mites reproduce very rapidly and are a great source of annoyance to the hens when present in large numbers. A severe attack of mites will cause the hens to lose flesh and stop laying, and will oftentimes produce death. To get rid of mites the houses must be carefully painted or sprayed with repellent material. A heavy spraying of coal oil followed in two or three days by giving the roosts and surrounding boards a thorough ipanting with crude oil will clean up the miter anr keep the house free for several months. This treatment should be applied twice yearly to all poultry houses as a precautionary measure against them .

POULTRY.

TO KEEP POULTRY FREE FROM VERMIN

No matter how new your coop is, or how much care you give it, or how much you believe it fre from vermin it is safe to say that no coop is entirely free from those little fellows that make such inroads into your income. They are bound to appear.

There is a variety of spraying liquids upon the market such as are used for cattle, etc., all suitable to spray nests, roosts and interior of coops. Give the interior of the coop, also the nests, boxes, but not roosts, a good going over with whitewash, not too thick, but light enough to spread well with the spray. Better not put it on too thick as it will easily peel.

All coops should be sprayed, even the little colony coops, giving them a thorough disinfectant liquid, and then spray with whitewash.

Your grounds should be looked into if your coops stand upon the same ground year in and year out. Spade around them, and turn the ground over. It is preferable to taking chances on disease through neglect.

If your little chicks' coops are on old ground, remove them, and spade the ground. Sow it to grass or clover seed, and let them get the benefit of the green feed.

Get your drinking vessels cleaned, also your hoppers. Scald them out and clean thoroughly. You don't know how those little pesky mites hide in the cracks of the metal containers. Look them over, and you will see them.

No matter how careful you are, mites and lice are bound to make their appearance sooner or later. It's the law of birds in more respects than one. For instance, the little sparrows bring more vermin into your poultry yard in one year than you ever dreamed of, to become infested when one least expects it.

WHAT TO DO WHEN HENS EAT THE EGGS

Egg eating sometimes becomes a serious vice, fowls becoming very fond of eggs when they have learned to eat them, and it often spreads from fowl to fowl. It usually begins through accident by eggs being broken or frozen . Be careful to see that this does not happen. See that the nests are properly supplied with straw or other nesting material and have them darkened so that if an egg is accidentally broken the fowls will not be likely to discover it. Supply plenty of lime in the form of oyster shells, bone or similar substances to insure a firm shell. As soon as it is discovered that a fowl has formed the hobit the fowl should be removed, in order to prevent the spread of the vice. Once formed, it is difficult to eradicate and the safest remedy is the death penalty.

Fowls sometimes pluck feathers from themselves and from each other, which is often caused by too close confinement, by the presence of insect pests, or by improper feeding. When some of the fowls of a flock have formed the habit slightly, a wide range with a change of diet, including a plentiful supply of animal feed, and freedom from insect pests, will usually correct the evil. Above all, see that the fowls have plenty of inducement to exercise. If the habit becomes well formed it is very troublesome and may necessitate the killing of some of the fowls in order to stop it.

HOW TO RAISE DUCKS

To be successful in raising ducks, one should have a roomy yard enclosed with poultry netting. The netting need not be over two fet wide. Ducks

Used from Coast to Coast

For nearly fifty years Pratts Poultry Regulator has been used and recommended by poultrymen the world over.

In Canada, successful poultry-raisers are writing us every day giving concrete proof of its value.

Mr. H. W. Corbett, of Annapolis, N.S., writes: "I have a flock of Plymouth Rock pullets. I put five in a separate house and gave them

Pratts POULTRY REGULATOR

"In February the five pullets produced 116 eggs, or 23 to 24 each. The other 30, without having Pratts, produced only 15 to 16 eggs each. I then fed the 30 Pratts Poultry Regulator, and in 10 days my hens increased 50 per cent. in laying."

Mr. Joseph Burrows, a shareholder in the Vernon, B.C., Fruit Union, writes: "I have used your Regulator for years, and find it indispensable."

Our files are full of testimonial letters—all unsolicited—proving beyond question that Pratts is all we claim and more.

Costs about one cent a month per bird.

Try it to-day at our risk.

THE Soldier Settlement Board of Canada offers every eligible returned man who has ample farming experience an opportunity of becoming a farm owner. It is also ready to assist certain inexperienced men to learn the farming business. Of the many thousands of applications that will be received by the Board during the next twelve months a considerable number will be from inexperienced men.

HOW YOU CAN ASSIST— METHOD OF TRAINING

Training Centres have been established to give a limited number of totally inexperienced prospective soldier settlers preliminary practical experience. It is essential, however, that all inexperienced men complete their training by working with successful farmers who will share their experience with them.

SUCCESSFUL FARMER! YOUR OPPORTUNITY

You alone can assist our fighters to acquire the experience necessary to ensure their success as farmers. There is a duty devolving upon you to take as many as possible on your farm. By giving them the benefit of your experience and advice you will fit them to operate successfully farms of their own in the shortest possible time.

The Soldier Settlement Board needs, and must have, the co-operation of successful farmers in every Province of Canada in carrying on this work. Training allowances are granted by the Board to assist in the maintenance of dependents. Will you afford the men an opportunity to gain experience? **Men are waiting now. Take at least one of them for the winter.**

W. J. OSBORNE, Principal
Fredericton, N. B.

Success Training Pays

We recently received a request from one of the largest firms in Canada to supply 72 young people for office work.

Prepare for one of these positions. Special classes now open. Enter as soon as possible.

SUCCESS BUSINESS COLLEGE, Ltd.

The Accredited School

Moncton, N. B. Truro, N. S.

should not be allowed to run at large over the premises they wili ruin a flower or vegetable garden in a short itme, but are not detrimental in the small fruit garden.

It is not necessary to have a fine, expensive house for ducks, but it should be dry and furnished with dry liter for roosting.

tI is not necessary to furnish swimming water for them, but they must have drinking water in plenty. A swimming place for the breders will result in a higher percentage of fertile eggs and also in stronger ducklings. This is why it pays to use great care in selecting breeders. Use only birds with long bodies, thick, short legs, yellow bills and feet and bright eyes.

Almost a Miracle But Very Simple

Was the Cure of John New by Dodd's Kidney Pills

His Troubles All Came from Sick Kidneys and He Treated Them With the Old Reliable. Canadian Remedy, Dodd's Kidney Pills.

Hillside, Battleford, Sask., Oct. 10th. (Special)—With a speed that was almost miraculous, Mr. John New, a well-known farmer here, has been cured of the kidney trouble from which he suffered for several years.

"Dodd's Kidney Pills cured me," he says. "I wish to give them all the thanks."

Speaking further of his troubles and their sudden cure, Mr. New says: "I think I inherited my kidney disease from my parents, and I suffered off and on for several years. I had stiffness in the joints, cramps in the muscles, backache and neuralgia.

"I perspired freely on the slightest exertion and my perspiration had an unpleasant odor. I was irritable, often dizzy and was depressed and low spirited. My skin was dry and had a harsh feel and I was often nervous.

"I took just one box of Dodd's Kidney Pills. They cured me."

If your troubles come from the kidneys you will have some of the symptoms that Dodd's Kidney Pills cured in Mr. New's case. Ask your neighbors about Dodd's Kidney Pills.

GIVE HENS PLENTY OF GREEN FEED

Nothing in the hen's ration is more important than green feed and it is especially important in winter. In the early fall it is best to plan on the winter's supply and take a chance on overestimating the amount rather than underestimating it. If the mangels have not done well, or if only a few were planted, it pays to start a late crop of turnips. Hens do not seem to like turnips as well as mangels, but they will do for green feed when other materials are lacking.

Mangels are the best winter green feed and a large amount of them can be grown on a small space. Sprouted oats are greatly relished by hens, but it is some work to prepare them and oats are expensive, so many poultrymen will find that they can get along very well by using mangels and leaving out the sprouted oats. Plan on a supply of cabbages if the mangel crop is short and then feed the cabbages first and save the mangels until late in the winter as they will keep better than cabbages.

Pumpkins are liked by poultry and we find that the crop of pumpkins will not bring much money on the market and they are a bulky crop to deliver. It is much better to feed them in the winter to the hens and market them in the form of fresh eggs. Boiled pumpkin mixed with bran is a healthful feed and very good for forcing the young stock or keeping the old hens healthy while confined in the laying house.

Clover is one of our best poultry feeds. It may be rolled in a cylinder of poultry wire and placed in the house where the birds can pick at it. Clover can be soaked in warm water to freshen it and then placed in the poultr yhouse in troughs. A fork of clean clover hay thrown on the floor of the house will keep the birds busy while they are confined during the winter or on stormy fall days.

Save all the cull vegetables for the poultry. They can be boiled and fed in the form of a wet mash. Such feed is so much better than a straight grain ration for fowls that no flock should be without it. It tones up the birds during the winter and helps them to lay eggs. Even if the cost of eggs in winter is about the value of the eggs, the hens have to be fed something so why not give them all they need and get paid for it rather than half feed them and receive nothing for what they do get.

We have found that a few feedings each week of boiled cull potatoes are relished by the birds and it helps to reduce the cost of feeding toem. At the present price of potatoes they are not economical poultry feed but there are apt to be many unmarketable culls especially after a dry season, and they can be used to advantage in the poultry mash. If there is a vegetable grower in the community some poultrymen can do well to purchase any of the cull stock which he is glad to get rid of at a very low price. Other farmers in the community raise crops of carrots, mangels, turnips or beets which do not find a ready sale on their local market and sometimes the poorer grade can be purchased by the poultryman at a price that makes it an economical investment.

FATTENING CRATES

The purpose of the fattening crate is to so confine the birds intended for market that they will have little opportunity for exercise, and will be grouped within a small space so that the labor of feeding can be reduced as much as possible. A number of crates built together, as is usually practised at the feeding stations of the packing houses, is called a battery. The floor of each crate is 1-inch mesh woven wire, which allows the droppings to work down into the dropping pan below. The crates should be placed in the coolest spot possible. If this happens to be a shed, care should be taken to provide an abundance of ventilation without direct drafts.

ITCHY LEGS

Veterinary Editor: "Could you give me a cure for my mare? She is itchy in her hind legs. At night she stamps in the stable. I feed her well and she is working every day and is in good health otherwise."

Ans.: Make a solution of corrosive sublimate at the strength of 30 grains to a quart of water. Heat a little of this to about 105 degrees Fahr. and rub well into the skin of the legs twice daily until itchiness ceases.

Where clover and timothy are grown together it is necessary to cut the crop before the timothy has quite reached the proper maturity in order to catch the clover at the right stage. It is customary to gauge the time of cutting by the maturity of the clover.

End Your Suffering!

Each year thousands of people throughout Canada put an end to their sufferings by the prompt use of Gin Pills. It is estimated that in the Dominion alone one out of every fifteen people annually use and derive the greatest benefit from these wonderful pills.

Prepared with the greatest care and thought from a formula that was only achieved after profound study and patient experimenting.

Gin Pills FOR THE KIDNEYS

have done more to relieve pain and prevent serious Kidney and Bladder Troubles than perhaps any other preparation that can be obtained.

Mr. Frank Ide, a pullman conductor, suffered intensely from pains in the groins, sore back and very severely from gravel and sediment. After taking Gin Pills Mr. Ide wrote us. "The pain left me entirely. I have no trouble whatever in urinating and I feel as well as I ever did in my life. I recommend Gin Pills to everybody in any way troubled with kidneys or bladder."

Mrs. Percy, Halifax, N.S., after trying a sample sent for six boxes. She wrote:—"Before I fiuished the third box I found myself for the first time in years free from pain—the pains did not return. I wish everyone who suffers from backache and kidney trouble would use Gin Pills. They are great,"

If you suffer with pains in the groins or back, Rheumatism, swollen ankles, stiff joints, gravel, constant headache and lassitude, constipation and dizziness, take Gin Pills and nip the trouble in the bud.

Send for free sample or get a box from your druggist or dealer, 50c with money-back guarantee.

Subjects relating to houschold science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

October's woods are bright and gay, a thousand colors vie
To win the golden smiles the Sun sends gleaming through the sky;
And though the flowers are dead and gone, one garden seems the earth,
For in God's world, as one charm dies, another starts to birth.
—John Reade.

THE BRUTE-JAW

By Josephine Page Wright

Mary had never stopped to analyze her happiness with her husband; she had never considered the remote possibility of unhappiness with him until the day she saw him strike their young son. Then she remembered many thngs, things that came tumbling out of the past like so many pestiferous insects.

She remembered the day she had announced her engagement, Edith, who afterwards was to be the maid-of-honor, received the news with disconcerting gravity. "I hope you may be very happy, Mary," she had said. "But I never should have the temerity to marry a man with a jaw like Robert's." Mary had laughed at the time.

Now Mary remembered the advice of her own mother. "You have always been more or less domineering, Mary. If you marry Robert you must curb that trait. A man wtih a jaw like Robert's will not stand for petty tyranny."

And even Robert's own mother had said, "We have the Blackstone jaw, both of us. I fancy it will never make trouble for you. You appear to be sensible."

Mary thought her husband very handsome. She was proud of his height, of his broad shoulders, of his big brown hands, of his grim, unsmiling mouth. Who wanted a man to be always agrin? She wanted Robert to be just as he was—until she saw him strike Bobbie.

Bobbie read everything. Mary was rather proud of the fact and was reluctant to interrupt his reading, even when bed-time came. When Bobbie was nine, he began to take advantage of that reluctance.

"Bobbie, dear, it is bed-time," suggested Mary one evening.

"Yes, just a minute," acquiesced Bobbie.

Robert laid aside his paper and watched his young son thoughtfully. Mary, in turn, watched her husband a little anxiously and with vague stirrings of resentment. Bobbie's very innocence of error made her his champion.

"Bobbie, dear, it is bed-time," she prompted tremulously.

"Yes, just a minute," acquiesced Bobbie, turning a leaf and beginning another chapter.

Mary turned to her husband with sudden apprehension. Robert met her eyes squarely and turned deliberately to the war news. Mary sighed with relief and resumed her novel. The hands of the clock continued to move relentlessly toward nine.

As the hour struck, Mary arose nervously, and put her hand on her son's book. The boy, without raising his eyes, withdrew the book from her touch slowly but firmly.

"Bobbie dear," pleaded Mary, "it is an hour past your bed-time."

"Yes, just a minute."

A firm large hand fell suddenly upon the lad's shoulder and Bobbie was dragged to his feet. The book, a handsome edition of Kipling, fell to the floor and lay with crumpled pages. Bobbie's eyes followed the book longingly and then looked into the eyes of his father.

"I am going to finish the chapter," defied Bobbie.

"You are going to bed at once," contradicted his father quietly.

Bob was tall and sturdy and his attitude of defiance made him appear manly. When, however, his will met that of his father, years and dignity were stripped from him and he began to whimper like a child of four.

"Go to your room," he commanded.

If the blow had fallen upon Mary's own shoulders it could not have struck her with greater force. She turned bewildered eyes from the door through which her son had just passed to her husband's face. The face was as serene as an April day after a shower.

"He's had that coming to him for some time," smiled Robert as though Mary must agree with him perfectly.

But Mary stood before him mute, seeing not the smile but only the brute-jaw. Yes, that was what they had meant, Edith and the others. She had been blind not to see it long ago. Robert had the strong square jaw of a brute and she had never seen it until he struck Bobbie.

"Robert," she begged, after an awkward pause. "I want you to promise me never to strike Bobbie again. I do not wish to have him punished that way. You do not understand. Few men do understand. It will break his spirit or it will make him—make him brutal as you are."

The smile was gone from Robert's lips.

"Go to bed, Mary," he counseled gravely. "Go to bed. You are as nervous as the boy."

She went to Bobbie's room to kiss him good-night and comfort him. He was fast asleep and there were no traces of tears on his cheek. She retired to her own room and locked the door. This was what women had meant when they spoke of domestic troubles. It might even lead to a separation from Robert. Mary shuddered. She resolved to be wise and patient but she knew she must stand between her child and brute force. She fell into a troubled sleep and dreamed that Robert had tied Bobbie to the bedpost and was whipping him with a riding-crop.

It was the memory of this dream which chilled her heart and soul and brought her down to the berakfast-room, a frozen image of her natural loving self. Robert and Bobbie were there before her and were chatting away in the most friendly fashion. That was like Bobbie.

"Sleep well?" asked her husband kindly.

"No," she answered, "and when I did sleep my dreams were troubled."

"They would be naturally. I tell you, Mary, it doesn't pay to go to bed in the frame of mind you were in."

Mary raised her eyebrows. "Frame of mind? Really I had control of myself, I believe."

"I wonder," muttered Robert into his second cup of coffee.

Graduall ythe ice that held her better self melted and she was able to meet and to talk to Robert with something of the old freedom. But in the background lurked a nameless fear.

One evening Bobbie begged to come and read his book in the library where they were sitting. Mary granted the permission reluctantly. Bobbie had been nervous and fretful and she feared to have him face his father in that mood. She was beginning to worry a littel about Bobby. He was not like other boys. Although this fact was oftenest a source of pride, sometimes the fear that the difference might make it hard for the boy in years to come troubled her.

This night Bobbie, as before, was absorbed in his book. He responded readily enough, however, to his father's command to light the fire. The servants had laid the paper, kindling and logs ready for the match. Bobbie liked to start the blaze and Mary realized that Robert had meant to please the boy in giving him the task. Bobbie struck several matches before the paper caught the spark. As the flames sprang up, Bobbie watched them with dreamy eyes. Bobbie was a dreamer. But like many another dreamer he let the match in his hands burn his fingers.

"It hurts," he whined and put his fingers into his mouth.

"Nonsense," said his father. "It doesn't hurt. Take your fingers out of your mouth."

"It does hurt," persisted the boy and the tears rolled out of his eyes.

"Bob, stop crying this instant," commanded his father.

"I-I c-cant stop crying," blubbered the boy.

Robert made a rush for his son. The big brown hand shot out, the open palm slapped the side of the lad's face. The blow caught the little fellow off guard and he staggered.

Mary looked at her child and then stepped quickly between him and her husband. Robert took a step forward but she waved him back.

"What do you want?" she demanded hoarsely. "Your work is done."

"Mary," protested Robert, "you are insane."

Mary threw wide her arms. "You shall never touch him again. You shall never even see him again—you brute!"

She left the boy and followed her husband into the hall.

"May I ask you to make all arrangements for Bobbie and me to leave Monday for the west?" she said.

"You think he will be better with your mother for a little time?" he faltered.

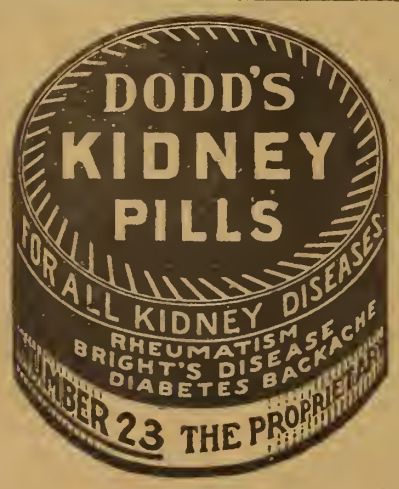
"Do not pretend to misunderstand me. I do not intend to come back—ever," she said coldly.

"Things like this are not settled so quickly," he reminded her. "The law gives me rights—"

"Would it? Would the law grant you any right in the face of this?"

He looked at her long and earnestly but she would not meet his eye. His face was still white and his hands trembled. He drew himself to his full height and clenched his hands.

"Yes," he said, "I shall see that you get away the first of the week."



KING COLE TEA
"You'll like the Flavor"

ARE YOUR BOWELS Constipated?

If So, Watch Your Health.

Unless one has a free action of the bowels, at least once a day, constipation is sure to ensue and it is one of the ills that causes more ill-health than any other trouble of the human system.

Keep your bowels regular by using Milburn's Laxa-Liver Pills and you won't be troubled with your stomach, you will have no sick or bilious headaches, no jaundice, piles, heartburn, water brash, catarrh of the stomach, floating specks before the eyes, and everything will not turn black and make you feel as if you were going to faint.

Mrs. Garnet Hutt, Morrisburg, Ont., writes:— Having been troubled for years with constipation and trying everything I knew of without effect, a friend advised me to use Milburn's Laxa-Liver Pills. I used four vials and am completely cured. I can gladly recommend them to every one who suffers from constipation."

Milburn's Laxa-Liver Pills are 25 cents a vial at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

She returned to the room and found Bobbie in bed.

"Please hand me the book I was reading when—when—"

She did not see Robert again until she met him at the station. Bobbie was frisking about, wild with the excitement of the proposed journey. When he saw his father he made a dash for him but Mary, alert, headed him off. She gave him change and told him to buy magazines to read on the train. Robert saw the move and rebuked her.

"Does that mean that I am not to say good-bye to him?"

She shrugged her shoulders. "Oh, of course, if you really care to."

Robert handed her the tickets. She examined them hastily and found in the envelope which contained them a large roll of bills. She took the bills out and deliberately dropped them upon the station-platform.

"Something of yours, I believe: Will you pick them up, please?" she said sweetly.

He stooped to gather them and stuffed them into the pocket of his topcoat. His face was flushed and Mary noticed that it was thin and that there were lines on it that she had never noticed before.

"Mary," he protested, "all this is not like you. You may refuse my money if you hate me so. But I claim the right to support my boy—"

"You boy?" she interrupted. "Your boy? Why you have no boy. That boy" pointing to Bobbie, "that boy is all mine."

Bobbie came back with his arms full of magazines. His face was rosy and full of the light of adventure. He liked to travel, did Bobbie, and he wished his father to know that he wanted him to go too. He sang out the invitation from half way across the platform.

"Can't do it my son," said Robert in an effort to speak lightly. "But you must be a manly little fellow and take care of mother. I want you to be manly, remember that. Be game."

Mary pulled the boy across the tracks and into the train. And there was a new bitterness in her heart because the little fellow waved good-bye to that silent figure on the platform, waved until it was out of sight. She sank down into the corner of the seat and cried until her eyes were red and her throat was parched and dry.

"Never mind," comforted Bobbie. "We'll have the good time of seeing grandpa and grandma and then we'll go back to dear old daddy."

"You poor, sweet, forgiving child," sobbed Mary under her breath.

Tears must have washed some of the bitterness away for when Mary regained her composure, she felt no sharp hatred of Robert's deed, only a hopeless sort of apathy, a feeling that she had lived her life, all of its joys and all of its terrors. There was nothing left but Bobbie, to live for him, to fight for him, if necessary to die for him.

The journey was long and tiresome. She began to dread meeting her parents. She dreaded the necessary announcement. She knew that they both loved Robert and she hated to kill that love by telling them of his great brutality.

Her father and mother were at the station to meet her. But their eyes were all for Bobbie. They fondled him, they held him at arm's length and tried to trace likenesses of beloved relatives in his immature features.

"But there's one thing I'm mighty glad of," concluded Bobbie's grandfather. "He's going to have a jaw like his father."

"Like Robert's?" gasped Mary.

"Why, yes, it's a lot like Robert's. Not so strong yet. Maybe it's because Bobbie's young. Maybe it's because you spoil him. You don't spoil the boy do you, Mary? It would be a pity for a boy to have a chin like that and then let it wobble."

"Are you sure Bobbie is a real boy?" questioned Mary's mother several days later. "I don't think he should play good for him. I think he should play around the house so much. It isn't with the Kelly boy."

"Is the Kelly boy a nice child?" asked Mary.

Bobbie's grandfather laughed suddenly. "He's just the boy for Bobbie to play with—now."

Mary dressed her son in what she considered an excellent play suit. His stockings were heavy but trim, his sandals were new and fit him perfectly, his white flannels were immaculate and his tie jaunty.

"H'm," said grandfather when he saw him, "so you're going to play with the Kelly boy, are you? Well he's as square a boy as you'll find asywhere. If I were you, I would appreciate him."

Bobbie had a wonderful time. His clothes were dirty when he returned tired and happy in the evening, but he was ready for another adventure next morning and Mary decided that the problem of companionship for Bobbie had probably solves itself.

In a way she was disappointed. When she left her husband for the sake of her child she had hoped that she and Bobbie might grow to be inseparable companions. She never could go back to Robert, but the place which he had filled in her life was larger than she had realized. She would not admit to herself that she wanted Robert but she did want something to make her forget him, something to take his place. And Bobbie was quite happy to play all day long wtih the Kelly boy.

Thus in her wanderings she came upon a low hedge which separated her from the lot in which Bobbie was playing with the Kelly boy. She heard and recognized their voices and with a mother's interest paused to listen. The fact that they were quarelling became obvious and something in the exasperating whine of her own boy made her delay intervention. For the first time in her life she was dispelased with Bobbie's conduct and she did not know why.

"You've got to take your turn," the Kelly boy was saying.

"But I am not going to play any more," announced Bobbie nonchalantly.

"You've got to take your turn or you're not game," persisted the other. Mary noticed that there was more of surprise than rebuke in the tones.

"I don't want to be game and I don't want to take my turn," boasted the incautious Bobbie airily. "I'm going home now anyhow. I don't like to play with you. You're rough.

"You can't turn me down like that." There was more than a trace of anger in the tones of the Kelly boy now. "You've got to take your turn or you have got to lick me."

"I don't want to fight. I'm a gentleman and I don't want to fight," shrilled Bobbie.

"You've got to fight," growled the Kelly boy between set teeth.

Mary looked over the hedge in time to see Bobbie receive a blow on the end of his unguarded nose. The Kelly boy stepped back, throwing both arms to his own defence. But Bobbie did not strike back. He cringed against the wall, covering his face with flabby outspread fingers. Mary expected to

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

Read My FREE Offer:

To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten day- trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box 309 - - Windsor, Ontario

see her son's opponent follow up his advantage. She stepped through the hedge and confronted them.

"Is he your boy?" asked the Kelly lad looking straight into her eyes.

With no feeling of pride Mary confirmed the suspicion. She saw her own boy come swiftly to her side and snuggle into the protection of her skirts. His hands were still before his face and he was crying audibly. He was bent at the shoulders but even so he was taller than the boy before them.

"He don't know how to fight, does he?" asked the Kelly boy, the wonder of it awing him a little.

Bobbie continued to sob. His mother shook herself loose and confronted him in a blaze of anger.

"Bob, stop crying this instant."

"I-I-c-can't stop crying," he snivelled.

Mary raised her hand and struck him with the force of her disappointment in him. "You're a coward," she cried, "a silly little coward."

Six days later Mary and Bobbie opened the door of their own home. The house was darkened and Mary peered into the shadows and shuddered. Bobbie tugging at the suit case kept wondering where his dear old daddy could be.

"Take the baggage up to my room and stay there till I call for you," smiled Mary. But in spite of the smile there was an imperiousness in her tone which Bobbie rather delighted to obey.

Mary found Robert in his study. He had fallen asleep and she saw the marks of suffering on his handsome face. She knelt at his side and rested her head on his shoulder.

"Robert," she aroused him softly.

"Mary," he breathed. "You have come back?"

"Oh, how can I tell you. I have been brutal. so much more brutal than you could ever be. There is nothing in the world more brutal than a self-satisfied woman. But I have suffered—I have suffered enough!"

"Yes, Mary," he agreed, "you have suffered enough. But you have come back. Lord, how hungry I have been for you and the boy."

He kissed her tenderly and then sat with his face close to hers.

"I have come back because I was starved for you. But if I hadn't loved you as I do, I should have come for the boy's sake. Bobbie needs you. He is an atrocious little coward. You see, dear, he has your splendid jaw but it's wobbly yet. Do you think you can make it strong and firm like yours?"

"Mary, I am quite sure we can make a man of him."

(End)

PRECAUTIONS THAT KEEP THE CHILDREN FROM TAKING COLD

The wise old saying, "An ounce of prevention is worth a pound of cure," is especially aplicable to the management of the child who takes cold easily.

Living in an area which hygenic and preventive methods go hand in hand with medicine, the intelligent mother is in a position to use these valuable aids in correcting such a tendency and it is solely of these that the present article treats.

One of the first steps is to ascertain whether there is a ny superfluous growth of tissues in nose or throat.

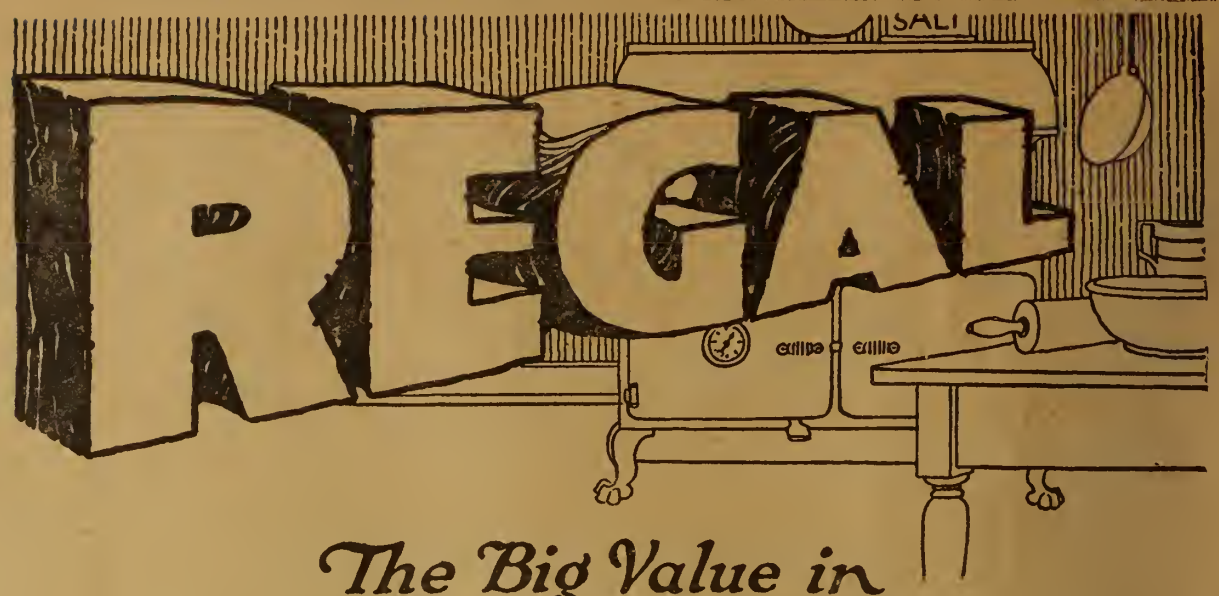
If your physician finds that small bunches of gristly, grape-like growths called adenoids clog the passage from nose to the throat or that the tonsils are abnormally large, obstructing the breathing and are often sore and painful, he will probably advise their removal. It is advisable to give your immediate consent to this as the process is very simple, causing only a day or two of discomfort, with little or no pain.

And your child who has a thick voice, perhaps a vacant expression, noisy breathing with open mouth, headaches or dull hearing, will be wondrefully relieved of colds and sore throats, and will improve markedly in mind and body.

The Right Amount of Clothing

Colds often arise from insufficient clothing causinb chilled extremeties and blue lips. With babies, they are often caused by lack of proper protection for the head when in the open air. Too much clothing, bringing out free perspiration, and causing a moist skin to be exposed to currents of cold air is as bad as too little clothing.

Overheated houses are a fruitful source of colds. The temperature of



The Big Value in
FLOUR

IN THE KITCHEN, the big event is baking day. And the important thing on baking day is to use "REGAL"—the ideal flour for bread. "REGAL" means bread of uniform texture, lasting freshness and wholesome qualities.

191

the rooms, especially those occupied by children should be maintained at a temperature of 68-70 degrees F. This is of the utmost importaoce for children who succumb readily to colds.

The child who leaves an overheated room in winter to go out into the cold outdoor air for exercise, even if it is well clad is not able to react promptly to the great difference in temperature that it encounters. Badly ventilated rooms and over indulgence in food either digestible or the reverse, reduce the vitality and resistive powers, so that a cold often results.

Your child should never be permitted to use the pocket handkerchief of another person, nor to come in close contact with any one suffering with colds as cold are undeniably communicable.

Guard against the bed clothes being thrown off at night, or when overheated, by securing them in such a way that the body is protected without interfering with the child's normal movements. Give the child extra covering at night if there is a sudden fall in temperature.

Babies should not be held near a window or draft on cold or damp days, nor allowed to play upon the floor in winter, nor carried from a warm atmosphere into a cooler without some protection.

Do not expose a child to dust nor allow it to sit in drafts or in the wind. Be on the watch for wet feet and have soaked or damp stockings and shoes changed at once; they are often to blame for colds.

Exercise that keeps the circulation even, that increases a development of the muscles and raises their tone is a great aid in bringing up the child's resistive powers.

Hardening is an important process and after your child is a year old you should gradually accustom it to a cold bath (daily.(It should be sponged each morning on back and chest with cold water.

Give Cold Baths Gradually

When the tub bath is given, after the child has been cleansed in warm water, the body should be sprayed with a hand spray, beginning with warm water and gradually lowering the temperatur as much as the child is willing to bear each time a bath is given.

In a short time it will endure and enjoy much colder water than was at first possible. Finally an entirely cold bath can be given.

A salt bath in the proportion of a tablespoon of salt to a gallon of water is very beneficial. There should be a thorough rubbing after the bath, especially in winter, until the skin is in a glow. In summer pat gently until dry so as not to begin the day in a perspiration with moist underwear.

During the hours of sleep see that there is a plentiful supply of fresh air even in winter. After the age of six months the sleeping room windows should be open at top and bottom, varying in amount according to the weather.

The child that is over a year old may have the room flooded with cold air, provided the bedclothing and sleeping garments are adequately warm and the bed is not in a draft and the sheets in winter are of flannes instead of cotton.

an upper porch that can be screened from rain, snow, and wind and used for sleeping purposes, the child that has passed babyhood can spend its nights there with advantage.

It should not, however, be allowed to become chilled there on its way to or from the suitably warm room where it is dressed and undressed. Sleeping out of doors is an excellent way of hardening the growing child but this should be started in mild weather.

When a cold appears in spite of precautions, it should be cured as quickly as possible, for each one that runs its course unchecked leaves the child more susceptible than before.

If it obstinately hangs on after the usual measures of hot drinks followed in a day or two by bed cleansing the nostrils and throat with a strong salt solution and correcting constipation, a doctor's advice should be asked at once.

For, besides the danger of allowing the mucous membrane to become chroncically tender and inflamed, certain of the contagious diseases come on with the symptoms of a common cold or sore throat and precautions for your own child's safety and the well being of others cannot be taken too soon.

MIXING AND MAKING CAKES

Follow These Rules And You Can't Have a Failure

Cakes form pleasant adjuncts to the necessaries of the household, and are only of secondary importance to bread making. There are four ways of making cakes.

The first method is used for plain cakes. The butter, lard or dripping is rubbed into the flour in the same way as for short pastry then the dry ingredients, such as sugar, fruit and spice, are added and lastly the eggs and milk. All are then well mixed together.

The second way is used for fruit, pound and seed cakes. The butter and sugar are creamed together, the eggs beaten in one at a time, and the fruit and flour stirred in lightly and quickly at the last.

In the third way the eggs and sugar are beaten together until thick and creamy, then the flour is stirred in lightly and quickly. This is used chiefly for sponge cakes and cakes of that texture.

For the fourth way the sugar, butter, milk and sirup or molasses are melted together, then cooled slightly and added to the dry ingredients. The method is used for gingerbreads.

Care must be taken to insure the right consistency of cakes. The mixture should be fairly stiff. If too moist the fruit will sink to the bottom.

For rich cakes the tins should be lined with paper, the paper coming a short distance above the tins, so that the cake is protected as it rises. For very rich fruit cakes, experience has shown that it is best not to grease the paper or tin. The cake is not so liable to burn, and then paper can be removed easily when the cake is done without injuring it. On the other hand, if tins are lined for sponge cakes or jelly rolls, the paper should be greased.

I should like to mention that when mixing cakes in which baking powder, carbonate of soda, cream of tartar or tartaric acid are used, almost everything depends upon the handling which should be as light and as little as possible. The more richly such cakes are made, the better they will be, and two cooks working from the same recipe will often produce entirely different results if one kneads her mixture and if it were household bread, while the other handles it with due lightness of touch.

As soon as the baking powder or other rising medium is added to the mixture, the cake should be put into the oven as quickly as possible. Soda alone is never good in a cake where there is butter or dripping, unless some substance containing acid is used along with it. Molasses is one of the substances containing acid.

The greatest care and cleanliness must be exercised in all cake making; and accuracy in proportioning the materials to be used is indispensable. The flour should be thoroughly dried and sifted, and lightly stirred in. Always sift flour before measuring, then stir it again with the baking-powder to insure a thorough blending. Good cakes can never be made with indifferent materials.

Eggs are used both as an aerating agent and as one of the "wetting materials." It is not economy to buy cheap eggs, for such eggs are small, weak, colorless, and often very stale. Eggs should be well beaten, yolks and white separately, unless other directions are given. The yolks must be beaten to a thick cream and the whites until they are a solid froth.

Sugar tends to improve the texture of cakes, and when cheap cakes are made plenty should be used, provided that the cake is not made too sweet. It sould be dissolved before added to the fat and flour.

For best cakes, and all that are required of a light color, fine-grained sugar should be used. With coarse grained sugar there is danger of producing specks which show on the cake after baking, unless they have been made by the method of beating up the eggs and sugar together with a beater over hot water. This method will dissolve the grains of sugar.

HAD BOILS

All Over Back, Legs and Body For 39 Months.

Ex-Gnr. F. Plumridge, 156 Curzon St., Toronto, Ont., writes:—"I am writing these few lines to let you know how wonderful is the effect of Burdock Blood Bitters. For thirty-nine months, overseas, I had boils all over my back, legs and body, in fact I was simply covered with them. I tried several different remedies, and while in France had medicines sent from England, but all to no avail.

On reaching Canada, July 12th, 1918, I was told to try your B. B. B. and on taking six bottles I had not even a scar left."

The only way to rid yourself of boils, pimples and all skin blotches and blemishes, so that they will never return to bother you again, is to have the blood thoroughly cleansed of all of its impurities, and there is no remedy on the market to-day to equal Burdock Blood Bitters.

This old and reliable preparation has been on the market for the past 40 years.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

PILES Do not suffer another day with Itching, Bleeding, or Protruding Piles. No surgical operation required. Dr. Chase's Ointment will relieve you at once and as certainly cure you. 60c. a box; all dealers, or Edmanson, Bates & Co., Limited, Toronto. Sample box free if you mention this paper and enclose 2c. stamp to pay postage.

making, as they are sweetest and cleanest. Currants and sultana raisins for cakes should not be too large but of medoum size and sweet and fleshy. Cheap, dry sultanas should not be used. Though there is no need to wash sultanas, yet if the fruit is inclined to be very dry, it will be better to do so than to put it in to spoil the appearance and the flavor of the cake. Currants should always be washed, cleaned and dried before using. Orange, lemon and citron peel should be of good color and flavor. They should not be added to cake mixture in chunks, as is often done, but should be in long shredded pieces. Large pieces of peel are sometimes the cause of cake cutting badly.

In making fruit cake add the fruit before the flour, as this will prevent it falling to the bottom.

If a cake cracks open while baking, the recipe contains too much flour.

In recipes in which milk is used as one ingredient, either sweet or buttermilk may be used, but not a mixture of both. Buttermilk makes a light spongy cake, and sweet milk a cake which cuts like pound cake.

In creaming butter and sugar, when the butter is too hard to blend easily, warm the bowl slightly, but do not heat the butter, as this will change both the flavor and texture of the cake.

For small cakes have a quick oven so that they set right through and the inside is baked by the time the outside is browned. For all large cakes have a quick oven at first, to raise them nicely and prevent the fruit from sinking to the bottom. The oven should then be allowed to become slower to fire the cakes thoroughly.

Cakes must not be hurried. Keep the oven steady though slow, and after putting a large cake into it do not open the door for at least twenty minutes. If the door must be opened, special care should be taken to close it very gently. If it is slammed carelessly, the shock may make the cake fall, and a quantity of cold air will be shut in which will check baking.

A very light cake put into a quick oven rises rapidly round the sides, but leaves a hollow in the middle. An excess in fat and sugar may also cause this; but there are other causes. If a cake is made too light with eggs or powder and an insufficient quantity of flour is added, it will drop in the centre. Another frequent cause is the moving of cakes while in the oven before the mixture has properly set. The same defect is produced if the cakes are removed from the oven before being baked sufficiently.

When a cake curdles, the texture will not be so even as if curdling had not taken place. Sometimes the mixture will curdle through the eggs being added too quickly, or if the butter contains to much water. This forms a sirup with the sugar and after a certain quantity of eggs has been added the butter will slip and slide about, and will not amalgamate with the other ingredients. Before turning it out allow it to remain in the tin for a few minutes. It is best to lay it on a wire cake stand, or lay it on a sieve; but if you do not possess these things, a loosely made basket turned upside down will do. Do not place cakes in a cold place or at an open window, or the steam will condense and make them heavy.

Wife—And knowing my sentiments on the subject, did that odious Mr. Binks insult you by offering you a drink?

Hubby—That's what Mr. Binks did.

Wife—And how did you resent it.

Hubby—I swallowed the insult.

JACOB BROS., Diamond Imp., 15 Toronto Arcade, Toronto

IN making the 100,000 McClary stoves in 1919, vast quantities of iron and steel must be handled every working day.

Yet every casting is even more rigidly inspected to-day than in the early days when only a few small stoves went out from the plant to create a name for McClary's.

Not an operation in the whole plant is allowed to be hurriedly or carelessly handled.

This rigid principle of manufacturing has made McClary's the greatest stove and furnace works under the British Flag.

To-day, if you are thinking of buying a heating or cooking device of any nature, you should consult McClary's.

Any of this list of Booklets on heating or cooking will be sent, if you mention this paper.

"Service from the kitchen"—about the Kootenay Steel Range.
"Magic of the Pandora"—about the Pandora Cast-Iron Range.
"Comfort in the Home"—on heating with the Sunshine Furnace.
"Satisfaction"—dealing with McClary's Gas Ranges.
"McClary's Electrical Appliances"—on cooking with electricity.
"Household Helper—Canning Edition"—describing McClary's Florence Automatic Oil Cook Stove.
"The Story of a Range"—McClary's Simplex Combination Coal and Gas Range.

FACING DEATH ON A CLEAN RECORD

Dying Gunner Expresses the Feeling That He Had Lived "A Pretty Fair Life"

This is a true story.

It was at Madagascar Corner, that corner out there in France which the ammunition wagons and supply trains used to pass when going up the line to the left Arras front.

The Hun had been harrassing the wagon lines of the Canadian field batteries: and in one of the huts one of the victims of German mathematical accuracy lay. He was almost cut in two. His face was the color of paper, but he was still conscious.

"You'll be all right in a little while, old man," one of the men who had carried him in remarked.

"Cut out that stuff!" The dying gunner snapped, although his voice was feeble. "I'm done for and you know it. But it isn't worrying me: I'm not afraid to die. I've lived a pretty fair life."

They buried him back there at Savy.

How about you? Have you lived a pretty fair life? Have you done the right thing?

When you subscribe to the Victory Loan, 1919, you are doing the right thing; you are performing one of the acts that go to make up a "pretty fair life."

Mistress—Now, Bridget, there's no use of further argument as to how the dish should be prepared, but our ideas on the subject are so different that it is evident one or the other of us is crazy.

Bridget—True for ye, mum—an' sure it isn't yerself'd be kapin' a crazy cook.

MARKETS.

THE PROVISION MARKET

Oct. 10.—The Toronto market for live hogs on Monday was steady to firm with sales off cars at $18 per 100 lbs. and fed and watered at $17.75 to $18, but at the close of day buyers were only bidding $16.25 per 100 lbs., f.o.b. for delivery on Tuesday which figure is 50c per 100 lbs. below what they closed at last week. There was no change in the local market today, prices being firm with a good demand from packers for all offerings and sales of selected lots were made at $17.50 to $18 per 100 lbs. weighed off cars. The trade in dressed hogs in a jobbing way was steady and prices were unchanged with sales of abattoir fresh-killed stock at $25.50 to $26 per 100 lbs.

There were no new developments in the market for smoked meats. A fair trade continues to be done in a jobbing way, there being a steady demand for supplies for domestic consumption, of which supplies are ample to meet all requirements. Sales of 8 to 10 lb. hams were made at 35c to 36c per lb. 12 to 15 lbs. at 33c to 34c, and heavy weights at 32c, while breakfast bacon sold at 44c to 45c, Windsor selected bacon at 46c to 48c, and Windsor boneless and skinless bacon at 50c

According to advices from London under date of September 20th, the market remains in an unsatisfactory state for Canadian and American bacon, and some time must elapse before matters are properly straightened out. The heavy accumulation of stock is being dealt with more expeditiously. Importers are allowed to handle their own brands, so that a more speedy clearance is assured. The market, however, is overdone with bacon out of condition, for which there is very little off-take, buyers discriminating strongly against these descriptions. Imports have been somewhat reduced from Canada and the United States, and the exports from Denmark have temporarily ceased, but in the course of the next few months shipments will be on an increasing scale.

There was no further change in the condition of the local market for lard, the feeling being still easy at the recent decline in prices on account of the large supplies available on spot. The demand at present is principally for small lots to meet immediate wants and sales of pure leaf grades in a jobbing way were made at 30c to 30½c per lb. in 20 lb. wood pails, and compound lard at 28c to 29c per lb. in 20 lb. wood pails.

The receipts of provisions today were 2071 packages lard, 514 boxes hams and bacon, and 1524 packages tinned meats.

Chicago, Oct. 9.—Provisions dropped in sympathy with hogs. There was no aggressive support. Prices closed 55c to $1.60 down.

Future quotations were:

	Open	High	Low	Close
Mess pork per bbl.:				
Oct. ...	———	———	———	$36.00
Jan	$32.60	$32.70	$32.37	$32.37

Cash prices closed: Pork, nominal. Lard $26.27. Ribs, $18.25 to $18.75.

BUTTER MARKET FAIRLY ACTIVE

(Montreal, Oct 10.)

The receipts of butter today were 1,287 packages, as against 1,727 for the same day last week, and 2,166 for the corresponding date a year ago. The offerings at Gould's Cold Storage today amounted to 300 packages of creamery butter, for which the demand was good and all sold at 54c to 54½c per lb. f.o.b. country points. The tone of the market continues strong and prices are steadily tending toward a higher level under a good demand for round lots for shipment to the United States and sales of several care ewere made today including one car of finest Eastern Townships creamery at 57c per lb. and one car of western creamery at 56c. The total shipments of creamery butter from here to New York last week were 13 car loads, aggregating 6,242 packages, and two car loads of dairy butter. There were received in Montreal last week 5 cars of western creamery. There has been no change in the wholesale jobbing prices as yet, sales of finest cramery being made today at 57c per lb in solid packages, and at 58c in 1 lb. blocks, but the indications are that they will be marked up in the near future.

We quote wholesale jobbing prices as follows:

Pasteurized creamery	57 c to 57½c
Finest creamery	56½c to 57c
Fine creamery	55½c to 56c
Finest dairy	52c to 53c

The receipts of cheese today were 13,439 boxes, as compared with 10,675 for the same day last week, and 12,884 for the corresponding date a year ago. At Gould's Cold Storage today there were between 2,000 to 2,500 boxes offered for which the demand was keen and all sold on the basis of 25c per lb. for No. 1 grade delivered in store here. In addition to the above there was also a good demand between houses for supplies and especially so for colored goods and sales were made at 26⅜c to 26½c per lb. with 25 15/16c bid for white and refused. Of the total stock of cheese in store here at the end of last month it is estimated that fully 200,000 boxes belongs to the Cheese Export Committee . It is reported that the low rate of exchange of late has interfered with business for Belgium account. At the old par of exchange the franc was worth 19.3c, today it is worth 12.3c. At the old rate 100 francs would buy $19.30 worth of cheese, while at the current rate it required 157 francs. The loss in purchasing power is therefore 57 per cent. and this means an addition of about 14½c per lb. to th cost of the cheesee.

The Canadian Cheese Export Committee will pay the following prices for all cheese delivered to warehouse, Montreal:

No. 1 grade, per lb.	25c
No. 2 grade, per lb.	24½c
No. 3 grade, per lb.	24c

New York, Oct. 10.—Butter steady. Receipts 10,813 tubs. Creamery, higher than extras, 65c to 65½c; creamery, extras, 92 score, 64½c; firsts, 54c to 63½c; packing stock, current make No. 2, 46c. Cheese steady. Receipts 4,533 boxes. State, whole milk ats, current make, specials, 30½c to 31¼c, do. average run 30c to 30¼c. State, whole milk, twins current make, specials, 30c to 30½c; do. average run, 29½c to 29¾c.

COUNTRY PRODUCE

Eggs Active and Firm—New Crop Honey Moving

Montreal, Oct. 10—A good steady trade continues to be done in eggs for local consumption, and the market is fairly active with a firm undertone. The demand is principally for selected stock and the movement of this grade is large for which most dealers claim to be realizing 63c per dozen. The trade in strictly new laid stock is only fair, while the demand for No. 1 and No. 2 eggs is slow. The receipts today were 5,802 cases, as against 11,574 for the same day last week, and 938 for the corresponding date a year ago.

We quote wholesale jobbing prices as follows:

Strictly new laid eggs	00c to 68c
Selected stock	00c to 61c
No. 1 stock	56c to 57c
No. 2 stock	52c to 54c

There was no further change in the condition of the market for poultry today. The demand continues good for supplies for local consumption for the season of the year, and the offerings are ample to meet all requirements with the exception of turkeys, which are rather scarce on spot. The prospects are that as soo nas the weather becomes colder a very large trade will be done as stocks on spot are comparatively small as compared with other years at this period.

We quote wholesale prices for live poultry as follows:

Chickens, broilers	N22c to 26c
Chickens	20c to 25c
Fowl, heavy	25c to 28c
Fowl, light	17c to 23c
Roosters	15c to 17c
Young ducks	17c to 22c
Old ducks	15c to 16c
Geese	15c to 20c
Turkeys	00c to 35c

There has been considerable more activity in the market for honey of late owing to the fact that farmers have reduced their prices and show a disposition to meet buyers' views, consequently the latter have been operating more freely and some large purchases have been made of late of white clover honey in comb at 22c to 23c per section, and white clover in 30 lb. tin pails at 20c per lb. f.o.b. country points. The offerings of buckwheat honey are light, for which farmers are asking 17c to 18c per lb. in 30 lb. tin pails, f.o.b. country points.

The market for potatoes continues easy on account of the liberal supplies available on spot for the season and the unfavorable weather prevailing for keeping stock. The demand for car lots is somewhat limited owing to the fact that jobbers are well supplied for the time being, and the last sales of Quebec white stock reported were at $1.40 per bag of 90 lbs. ex-track.

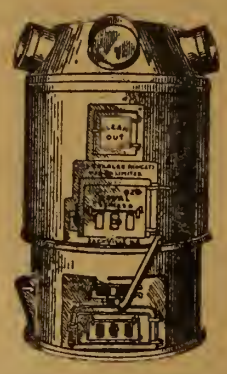
Chicago, Oct. 7.—Eggs unsettled. Receipts 9,984 cases. Firsts, 54c to 56c; ordinary firsts, 46½c to 47½c, cases included, 47c to 55c; storage packed, firsts, 57½c to 58c.

New York, Oct. 7.—Eggs unsettled. Receipts 13,128 cases. Fresh gathered, extras, 66c to 67c; extra firsts, 62c to 65c; firsts, 49½c to 62c; States, Pennsylvania and nearby western hennery, whites, fine to fancy, 83c to 86s. State, Pennsylvania and nearby hennery whites, ordinary to prime, 65c to 81c; State, Pennsylvania and nearby hennery browns, 70c to 73c; do. gathered browns and mixed, 66c to 69c.

LIVE STOCK MARKETS

Cattle and Hog Prices Steady at Toronto

Toronto, Oct. 10—On the local cattle market today there was the usual light run of fresh stock offering today, but with quite a good active demand. Everything, including held-over stuff from yesterday's market, was practically cleaned up at steady prices. For the choicest butcher steers and heifers there was a little better tone



Fawcett

New Rival

Is a coal Furnace, which is the result of more than half a century of successful experience and painstaking effort. It is the embodiment of all a Warm Air Furnace should be.

The New Rival is of the finest construction, most compact, durable and best finished Warm Air Furnace on the market. It has large heating surface, every inch of its external area being an active and effective source of heat radiation.

It has many features of unequalled excellence. Accept no substitute or you will regret it.

Ask for circular on Warm Air Furnaces.

Ask your dealer to show you the Fawcett Line or write direct.

CHARLES FAWCETT LIMITED
SACKVILLE · N · B · CANADA

to the market than yesterday. There was no heavy steers in the market and probably none were wanted, but for the handy weight choice butcher there was a very good demand. Lambs firmed up, the market being good and strong at an advance of 50c to 75c. Hogs were nominally the same as yesterday, steady at $16.75 to $17, f.o.b., though as a matter of fact there were no sale tickets marketed up to the noon hour, notwithstanding the new Government regulation requiring that the sale price shall be marked on the weigh scales tickets. At the Union Stock Yards the receipts today were 604 cattle, 393 calves, 784 hogs, and 6,306 sheep and lambs.

ANOTHER ADVANCE IN FLAX PRICES

Winnipeg, Oct. 10.—Messrs. Baird & Botterell wired Shearson & Hammill the following:

Flax—Rapid advancing market. Recent aggressive short sellers on the Argentine news badly punished. The market seems to have advanced entirely too fast for crushers, as there is no evidence of any crushers buying. Argentine is beginning to offer again, although the market has been sharply higher today and yesterday, we rather feel the advance has eliminated the large shorts that must have been built up during the siege of Argentine bearish news, that the trade were furnished with, and we are inclined to the view that actual hedging will become a factor and looked for a gradually receding market against.

Fluctuations in grain today were:

	Open	High	Low	Close
—Barley—

CO-OPERATIVE SHEEP SELLING

Mr. J. K. King, Maritime Sheep Representative of the Live Stock Branch, has been instrumental in organizing the co-operative shipment of several carloads of sheep and lambs from the Maritime Provinces to the Montreal market. Maritime sheep men have always been at a disadvantage in marketing their stock, owing to lack of stock yard and abattoir facilities. Through co-operative shipping this difficulty is being temporarily overcome. In all eight carloads have been forwarded to date, comprising 759 sheep and lambs. The cars were consigned to and sold by a Montreal commission firm, and the lowest returns secured realized $2.50 to $2.75 per head more than would have been obtained at home. The farmers claim that prices now paid in the country have advanced as a result of co-operative shipments.

MILLFEED AND ROLLED OATS

Montreal, Oct. 10.—The condition of the market for millfeed is unchanged. The demand is good and the market is active with a firm undertone. Sales of car lots of bran were made at $45, and shorts at $55 per ton, including bags, ex-track, and broken lots of bran in mixed cars at $46 to $46.75, and shorts at $56 to $56.75 per ton, including bags, delivered, all less 25c per ton for spot cash. The market for rolled oats is quiet with car lots of standard grades selling at $4.45 per bag of 90 lbs. in jute, and at $5 in cotton, ex-track.

INVINCIBLE

FORMERLY CALLED MONARCH

JUST like an auto tire. That's how "Invincibles" are made. From the same tough tire tread stock and with the same high Pressure Process of curing.

When you next buy rubber boots ask for "Invincibles" and you'll get the toughest and longest wearing boot your money can buy. The best advertisement "Invincibles" have is the man who has been wearing them.

You don't know how good a boot can be until you've worn "Invincibles". 8

POTTED PLANTS FOR THE WINTER MONTHS

Those desirous of having success with potted plants during the winter months should make careful preparations during the late summer and early autumn, and they will find it much easier to have fine house plants.

If plants are allowed to remain out of doors until injured by frost they cannot be expected to do much during winter .

Lift all pot plants not later than September. Use good soil.

Let the plants become well accustomed to being in the house while it is yet warm enough to have the doors and windows open, for if they are taken indoors to protect them the warm close atmosphere will weaken the plants, and they cannot do as well as if they are hardened and become accustomed to the indoor location.

All plants that are so treated will carry their large thrifty appearance on into the winter and if properly cared for should produce a fine lot of flowers. Buds should be removed during late summer to help produce bloom in winter.

NEEDS OF THE HOME VS. THE BARN

A woman on the farm can make her life about what she wishes it to be, for a great deal depends upon her attitude towards farm life and the work that it brings.

She is an equal partner with "dad" and they should work together. There can be no set and definite lines drawn between outdoor and indoor operations. The improvements that are necessary and can be afforded outside to save time, labor and money, can be afforded and are fully as necessary inside for the same reason.

Any farm that can afford running watre to be pined into the barn for the old "red cow" can afford to furnish the house with the same necessity. If the farmer needs a gang plow, the farmer's wife needs a washing machine run by power. The woman is to blame because her home improvements do not keep pace with the outside improvements. She is too willing to keep doing without and using the tools her great grandmother had. Any man is willing if he is financially able to make the kitchen the right kind of workshop for the farm women, but she must study her problem and then both together must determine the greatest needs so that home improvements may be made.

Let us resolve to get away from primitive methods and plan and work to have well equipped, comfortable, convenient and sanitary farm homes. —Miriam M. Haynes.

Laid 30 Years ago—perfectly sound today
Get real economy—get absolute protection for your buildings for a generation and more. Use
Eastlake Galvanized Shingles
They are a PROVEN roofing—not an experiment. Very easily laid, joints are snug and close fitting—they simply cannot leak. They save labor in laying and improve your buildings. Reduce insurance rates. No danger from fire by lightning or sparks.
Write for interesting Booklet. Price lists and detailed information about "Metallic" building materials, Siding, Corrugated Iron, "Metallic" Ceilings, etc.

Strike and Stretch, Heave and Bend

Atlantic Underwear makes friends with men of action because it stands the strain of the heaviest work.

The long, fine sea-breeze toughened wool of the Maritime sheep gives to Atlantic its strength, warmth and wear resisting qualities.

Zero weather gives no qualms to the man clad in Atlantic Underwear for it keeps him snug and warm, and absorbs the perspiration.

Sold in five different weights and qualities. Our lower-priced lines are not equal to the more expensive ones, but each is guaranteed to be the best value of its class. Compare them with others of like price and see for yourself.

THE WILL TO SUCCEED

Men on active service learned much about one another and perhaps the Canadian soldiers learned to recognize and appreciate the Canadian Spirit. Before 1914 most folk would have been puzzled if asked to explain the differences between a Canadian and an American, or between a Canadian and an English man. Perhaps superficial differesces might have been cited, but the peculiar inner possession of every good Canadian would have remained elusive.

The men marching to Passchendaele, Vimy or Cambrai knew one another. They recognized certain treasures of humor, of iniative and of energy which inspirited the soldiers and the Corps as a whole. They knew something of the semi-Puritan strain of resolution which made war almost evangelical.

Perhaps also they recognized in the continuing support of the people at home that iron quality of native Canadianism. Those who were leaders in Canada during the struggle developed a finer conceit of their country and their countrymen. They discovered that the Canadian could start things and hang on until they were finished. He was no quitter. The demands of the Red Cross were met. The calls of the Patriotic Fund were answered. There was evident in the people a passionate desire to see the thing through, no matter at what cost of convenience or money. Perhaps the Canadian Spirit could be defined now, after these five years, as the Will to Succeed.

When the Armistice was signed in November 1919 the Dominion was engaged in floating a popular War Loan. The thrill of victory was in the air, and the slogan "Bring the Boys Home" had an echo in every heart. The total subscription reached $610,000,000. Once more the Will to Succeed had been apparent.

Then, the fighting was over. To-day the war is over, but the military charges are not yet complete. During the present fiscal year many thousands of men have been paid, clothed, maintained and brought across the Atlantic. They have received the gratuities established by Statute, and such of them as desire technical training are taking special courses at national expense. For these and other outlays arising out of the war another Victory Loan is imperative.

The facts are before the public and the co-operation of everyone is urgently required to complete the obligations of Canada to the soldiers and make a clean-up of a well-conducted and successful war. The Canadian Spirit will make the subscription commensurate with other War efforts during the past five years. Remember the national Will to Succeed. It is equal to every emergency.

WHY A PIT SILO

First, because every farmer who has right soil conditions can have one and second because it will pay for itself in a year.

Pit silos cannot be built where water will seep in or where there are large boulders to interfer. The former is more serious than the latter. Pit silos can be built in most places where water does not give trouble.

Dozens, if not hundreds, of surface silos, costing from $500.00 to $1000.00, are being built to every pit silo. Why? Because they are for sale and can be bought. There would not be a hundred surface silos in Colorado today if it were not so. They did not come until the manufacturer brought them and so it will be with the pit silo. A few farmers are building pit silos, but generally farmers are too busy to do it themselves, they often cannot secure labor to do it and consequently it is not done.

A certain firm in Colorado is offering to build pit silos. A 51 ton silo will cost about $170.00. That looks high when some farmers will tell how cheaply they built their pit silos, but they did not take the cost of their labor into account. Such talk is mainly responsible for the small number of pit silos that are being built.

A third of the crop is lost when it does not go into the silo. A third of 51 tons is 17 tons and as silage sells at not less than $10.00 a ton, the saving amounts to at least $170.00, the price of the silo.

There is no other piece of farm equipment that will give as great returns and pay for itself in a year like the pit silo. There should be hundreds of pit silos buitl to every one that is now being constructed. It is better to sell a cow if necessary and get a silo than to go along year after year without it. To do so is "saving at the spicket and losing at the bung."—R. W. Clarke, Colorado Agricultural College.

Cabbages may be stored in a pit, but it is easier to put them into or remove them from a trench. A good idea is to dig a trench about 18 inches deep and a foot wide. Put a layer of straw in the bottom of the trench. Leave the roots and leaves on the cabbage and put it into a trench, roots up. Then put a layer of straw in the th etrench, but above the heads, and cover the rest of the pit with soil. Cabbages keep well in this long pit and may be easily removed when needed for the table.

A New York orchardist was laid up with a severe illness, and his work was away behind. His neighbors turned seven power spray outfits into his orchard and cleaned it up in a short time. The milk of human kindness still has its quota of cream.

KEEP
Holstein-Friesian Cows

1. The Holstein-Friesian is a large vigorous cow, full of energy and abounding in vitality.
2. Her physical organization and digestive capacity are such that she is able to turn to the best advantage the roughage of the farm, converting the same into merchantable products.
3. She yields large quantities of most excellent milk, fit for all uses and especially suited for shipping purposes.
4. Heredity is so firmly established through her long lineage that she is able to perpetuate herself for the production of strong, healthy calves.
5. When for any reason her usefulness in the dairy is at an end, she fattens readily and makes excellent beef.

If you can't buy a herd, buy a heifer

FOR SALE !

Several young bulls of serviceable age and youngsters. Well bred and good individuals. Prize winners at our recent show. Their dams won 1st. 2nd and 3rd in the ring of aged cows; also 1st and 2nd in the dairy test, 1st in heifer class and st in grade cow, competing against all breeds at our late show at Charlottetown, with an average fat of nearly 4 per cent. We will send photos of these young bulls and their dams to any prospective buyers. For quick sale we have priced them at from $50 to $125.

W. M. LEA,
"RIVERSIDE FARM," VICTORIA, P.E.I.

FOR SALE !

We have an exceptionally fine litter of 13 (living) of our large Berks for sale @ $12.00, four to 6 weeks old. Ready first of June.

Owing to scarcity of labor and we not being able to see eye to eye with certain Gov. officials, as to the type of Shorthorn to raise, we have decided to go out of the breeding and raising of pure bred live stock. Therefore our herd of 40 head of Shorthorns will be sold between now and fall for either breeding or for beef. Parties wishing to buy, please come and see them. We have seven very nice bulls, 10 months to two years.

The Pick of the Popular Artists and Concert and Grand Opera Stars

At your bidding Nora Bayes rollicks through her latest song. Put on one of Jolson's records and he jollies you along. You can almost see Bert Williams when you hear his deep bass voice. Van and Schenck are just as funny in your home as on the stage.

The many great concert and Grand Opera stars who make records for Columbia exclusively do so because Columbia Records conserve the charm of personality and truly convey the living human voice.

The exclusive Columbia Records made by great singers, pianists, violinists, orchestras, bands and other ensembles bring these artists before you as intimately, warmly, vividly, as if they were actually there in the flesh.

The
MARITIME FARMER
AND CO-OPERATIVE DAIRYMAN

REGISTERED TRADEMARK

Published Twice-a-month in the Interests of the Farmers of the Maritime Provinces of Canada

Vol. 25 SUSSEX, N. B., OCTOBER 28, 1919 No 2.

Library Univ of Illinois
University Street
Urbana Ill.

"YOU SEE IT'S A MARITIME FENCE"

Maritime fences will stand the severest tests, because they are built throughout of extra heavy hard drawn No. 9 steel wire. The superior stretching power of No. 9 wire keeps the strands from snapping under heavy strains or hard frosts. Each fence is thoroughly galvanised and will sturdily resist the rust and rot of weather.

STANDS THE TEST OF MAN, BEAST, WEATHER and TIME

The strands and stays are firmly gripped at every join by our special time tried and tested never-slip lock. Even after years of hard service, Maritime wire fence retains its sagless shape and sightly appearance. All Maritime Fences are carefully inspected and rigidly tested before leaving the factory. When you buy it you know you have got something that is bull strong and hog tight, something that will withstand greater strain than it is ever likely to receive.

Before you buy fencing it will pay you to first learn what the Maritime has to offer in the way of real fence service.

For sale by agents and dealers in nearly every section.
If you don't know the local dealer, write to us direct.

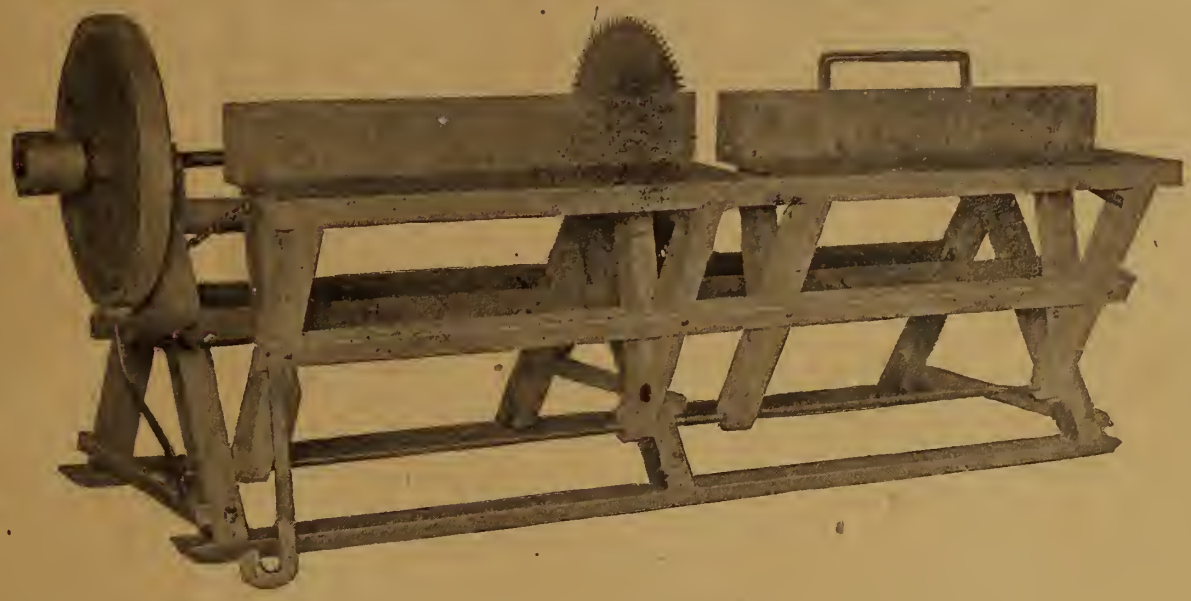
SUSSEX WOOD CUTTERS

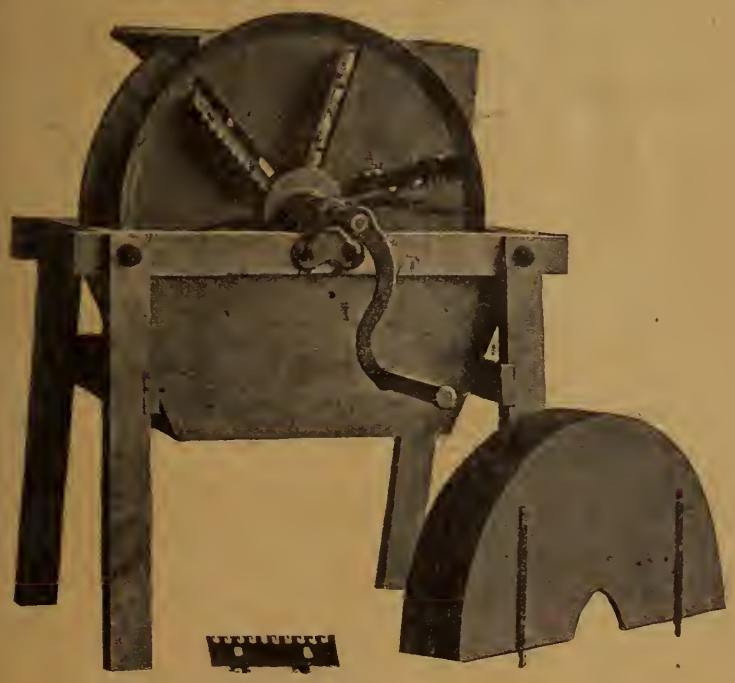
The Best by Test



Buy the Right Article made in the Right Place Is the Right Thing to do

Made in three styles. **Long Swing** as shown in cut, 4′ 3″ between balance wheel and saw. **Short Swing** 3′ 3″ between balance wheel and saw. Flat Roller Table 4′ 3″ between balance wheel and saw. **Balance Wheel 150 lbs.** Frames made of heavy birch mortised and bolted together. Tables made of heavy sheet steel. Saws 28″ Simonds. Saw supplied with each machine unless otherwise specified. Sussex Wood Cutters are not made to cut kindling wood they are built to cut those heavy birch and beech sticks which you will have to cut and stand up to it day after day.

WALLACE ROOT PULPERS



Side wheel reversible knife.
Root Pulper for pulping and slicing. Roller bearing.
A convenient, strong, easy running Pulper.

SUSSEX FEED COOKERS

Stoves of heavy sheet steel.
Made in 3 sizes No. 30 cap. 1 bbl.
No. 40 cap. 1½ bbl.
No. 50 cap. 2 bbl.

Sussex Little Giant Threshers. A few new ones and a second hand machine left for quick sale. Also second hand 6 h. p. Engine all in good repair.

You will need one of the above articles, write us now for full particulars and prices. **It will pay you.**

DELCO LIGHT

The Complete Electric Light and Power Plant

Lights the Home

Pumps the Water

Pays for Itself

ANY one of over 75,000 users will tell you that Delco-Light pays for itself.

In money.

They will tell you that the pleasure and comfort of Delco-Light cost you nothing.

Delco-Light does work on the farm. Saves time for more productive things. Its electric power will, in most cases, save enough time to pay for the complete Delco-Light plant in three years.

The electric light you get free.

CHORES are non-productive work. Cut down chore time and you can do things worth money to you. Wm. Schneekloth says the electric power from his Delco-Light plant saves him 8½ hours a week on the churn, separator and washing machine alone—over 40 working days in a year. Think of the money he can make in those forty days.

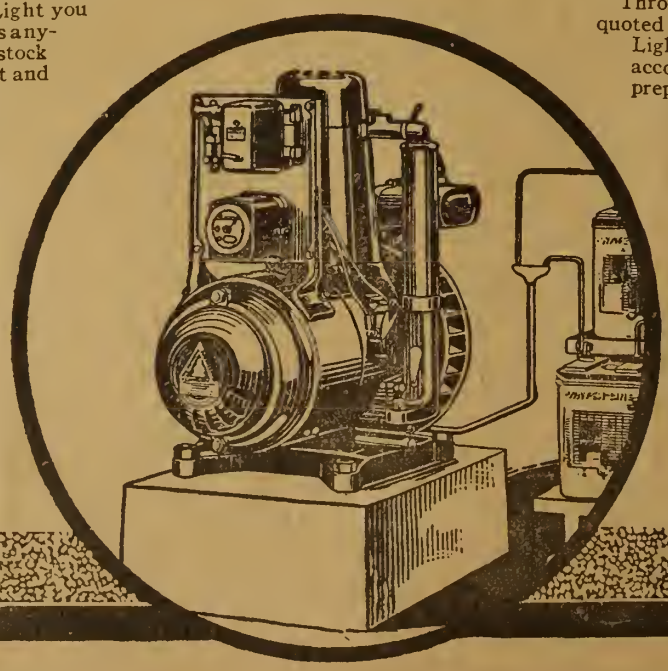
On the Helms farm at Belleville they use Delco-Light power for the chores—in milking and feeding stock, in pumping water, in ironing and washing—and save 19 hours a week or about three months of one man's work in the year. Here's a hired man's work for three months which Delco-Light does. The cost of operating Delco-Light is less than the cost of oil for oil lamps.

But operating the small machinery around the farm is only a part of the work which Delco-Light does for you. Take the question of pumping water; with Delco-Light you can have water under pressure at taps anywhere on the farm. You can water stock easily and quickly. You can have hot and cold water in the house. S. W. Cooke and Son of Maysville, have a big herd of Holsteins. Delco-Light has pumped the water and done the milking for three years. They figure that their saving is not less than $1,800. As Mr. Cooke says, they could pretty nearly afford a new Delco-Light plant every year. And remember this saving does not include the convenience and comfort and saving of electric lights.

J. H. Lackey raises Polled Jerseys and Poland China Hogs. He, also, needs a lot of water. His Delco-Light outfit enables him to get along *without* two men he formerly hired.

AROUND THE HOUSE there is a great big saving of time and work for your wife—time she can very well use for her chickens or her garden or her dressmaking. A. F. Hinnenkamp tells us that Delco-Light saves his wife 416 hours of housework a year by operating an electric iron, a vacuum sweeper and a washing machine. *Besides*—no lamps to clean, no matches to use, no danger of fire, lots of light.

C. F. Tressin adds in the time saved from cleaning lamps and makes a total of 547 hours a year. Think of all the things your wife could do with that extra seven weeks. And then you have electric light. You can't know the joy and comfort of electric light till you have experienced it. Just press a button and release a flood of bright, clean, *safe* light. No matches. No lamps. No danger. Delco-Light gives four times as much light from a gallon of coal oil as a lamp gives.



DELCO-LIGHT is a complete electric light and power plant, easy to install and easy to care for. It will give twenty-four-hour-a-day electric light and power service.

Delco-Light is direct-connected. There are no belts to slip, break or be replaced.

It is self-cranking. Pressing down a lever starts the engine.

It is air-cooled. There is no water to carry, to freeze or to boil away.

There is only one place to put oil.

A simple mixing valve regulates the fuel supply. There is no complicated carburetor.

Ball and roller bearings cut down friction to a minimum.

Long-life batteries mean economy.

You need to know more about Delco-Light. We have fully illustrated literature showing Delco-Light in operation. Write your nearest distributor for it.

Throughout this advertisement we have quoted from letters received from Delco-Light users. Each of these letters is accompanied by an affidavit. We have prepared a folder reproducing some of these letters, and with photographs of some farms where Delco-Light is used. Your nearest distributor will be glad to send this book to you.

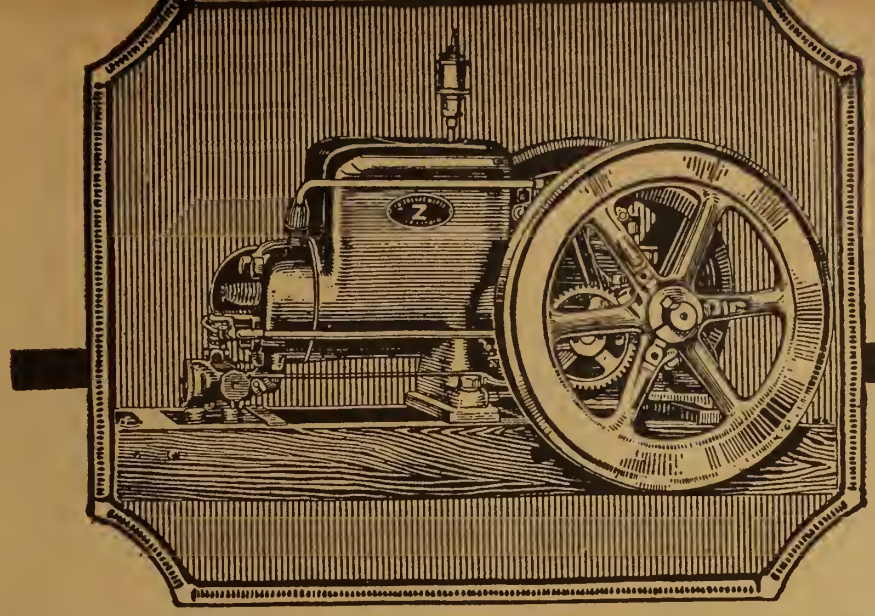
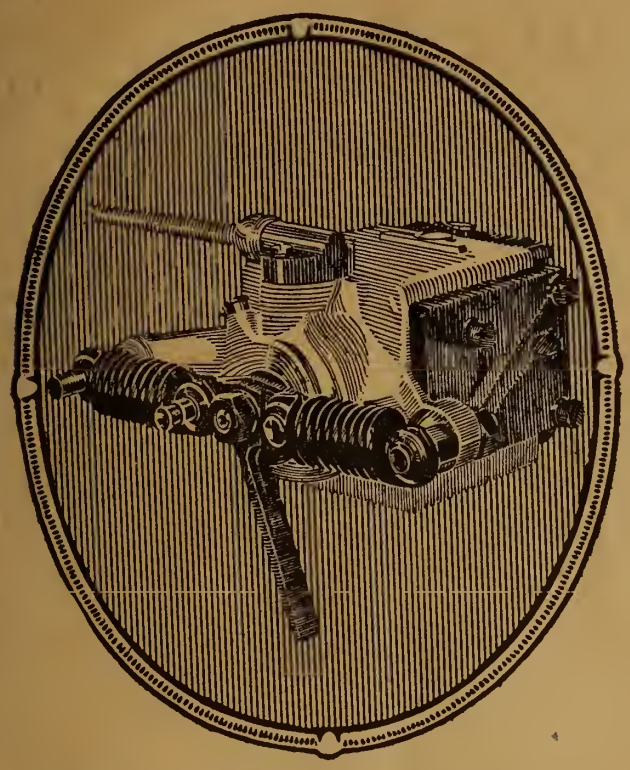
Making the Best Engine Better-



Fairbanks-Morse "Z" Farm Engine with Bosch Magneto



JUST think of the famous "Z" engine with a Bosch high tension, oscillating magneto—which delivers a steady succession of hot, intensive sparks. ¶ Every farmer in Canada should at once call on the nearest "Z" engine dealer and see the result of this recent epoch-making combination—FAIRBANKS-MORSE "Z" WITH BOSCH MAGNETO. ¶ Mechanical perfection, plus power—and right price—to date sold the "Z" Engine to over 250,000 farmers. ¶ This quality and quantity production enabled us to contract for a large proportion of the extensive Bosch facilities for making this one possible "Z" betterment, which establishes a new farm engine standard. ¶ And all Bosch Service Stations throughout Canada will assist our dealers in delivering maximum engine service.

A Real Money Saver

Farmers cannot afford now-a-days to drag along with old-fashioned methods. This handy truck scale will prove a wonder as a money-saver, and will make many short-cuts in your work. The

Renfrew
TRUCK SCALE

weighs anything from a pound to a ton. There is no need to lift heavy loads; simply truck the scale to whatever you want to weigh, slip it underneath, and the load is weighed. When it is not in use it can be stood up against the wall out of your way. Every part of the patform weighs accurately on even or uneven ground.

You need it for weighing cattle, horses, hogs, sheep, grain, feed, groceries, milk, etc. It is simple in construction and built for durability. Every scale carries a Government certificate of correct weight.

LIVE STOCK NOTES

The districts from which the greatest numbers of live stock are regularly shipped to market are the districts which have suffered least from drought this year.

The following extract is from a letter just received from the head of an importing firm in Paris,—

"Some friends of mine now seem well disposed to enter into the business. They intend to import for Belgium and North of France through Dunkirk and Antwerp. Animals are specially wanted for wilk purposes and my friends want to know the breed of proposed cattle, also the average production of a cow. It is suggested to send young cows in state of pregnancy for some months, in order to avoid accidents during the voyage. If prices are suitable, we may buy several thousand head of cattle. Payment will be effectuated by bank credit opened in New York or in Montreal when giving the order, money delivered against bill of lading."

Copies of the letter are being addressed to various firms and parties likely to be interested in this business and our correspondent will be forwarded the information he asks so soon as it can be obtained.

Our Markets Representative at one of the Stock Yards reports that during the week ending October 9th there were over 15,000 sheep and lambs on the market. He graded over 8,000 of these and estimates that there were not more than 300 wethers in the lot. He quotes several instances of lambs averaging from 68 lbs .to 73 lbs. which sold for 12 cents and of other lots of lambs averaging from 64 lbs. to 71 lbs. which sold for 13 cents. It will be noted that the 13 cent lambs were of equal weight or lighter than the 12 cent lambs. Our representative reports that the difference in price was entirely due to the fact that the good lambs were better bred and that a large percentage of males had been castrated and docked.

From April 1st to September 30th, approximately 100,000 cases of Canadian eggs have been inspected and passed for export. 83,503 cases were inspected for export in Eastern Canada, and 10 car loads for shipment direct to Great Britain from Winnipeg. Is addition to the above, 70 cars moved from Eastern Canada under inspection to Montreal, 19 cars to Toronto, 83 cars to British Columbia and 60 cars interprovincially between the Prairie Provinces.

It will be remembered that eggs cannot now move interprovincially or for export except under government inspection and in accordance with Standard grade. British importers have strongly commended this action on the part of Canada and give it as their opinion that it will go far to establish Canadian eggs on the British market as eggs of uniform and dependable quality. Our eggs now command a steady premium over United States product and export movement for October promises to be exceptionally heavy, provided space can be obtained.

Dominion Live Stock Commissioner.

CAPT .GOOD RETURNS TO THE COLLEGE STAFF

Capt. C. A. Good, formerly assistant entomologist at the Agricultural College, Truro, who has been overseas for the past three years, has just returned from England. Since the Armistice Capt. Good has been teaching in the Khaki University. He is again taking up his work at Truro, where his presence will add to the effectiveness of the Entomological Department at the College.

Buy a Better Buck and Flush the Ewes

F. Walker in American Sheep Breeder

The folowing article by J. F. Walker in the columns of the American Sheep Breeder should be of interest to every reader of the Maritime Farmer. If you have never owned a pure bred, buy one this fall and take advantage of the Federal and Local Governments' assistance. Buy a good one and follow the advice contained in this article:—

The Head of the Flock

He stood in the stock yard pen, resting on three legs, his horns propped up aganist the fence as if for support, looking decidedly the worse for wear. He had been bought in by the local buyer along with a job lot of sheep, and his future seemed brief. A farmer who owned a large farm and who is able to support a six-cylinder automobile, saw him standing there. "What will you take for him,' he asked the buyer?

"Five dollars," was the reply.

"Is he any good?"

"Can't prove it by me. I bought him along with this bunch of wether end ewe stuff and he must be all right, or he wouldn't be sticking around in the country this long."

"Give you four dollars for him."

"No, I gave four dollars. Tell you what I'll do, I'll split the difference," and at the magnificent sum of four dollars and fifty cents the bargain was completed, the old ram loaded in the back of the machine and taken to his new home.

I happened on the scene just as he was being loaded in the car. "Been buying a sheep?" I inquired of the owner.

"Yes, expect to use him on about fifty ewes. That's a good deal cheaper than any you felows that are raising them to sel lwould price one to me."

"What breed is he?" was my next inquiry.

"I don't know; got horns, he must be a Merino."

"How is his woll?" was my next inquiry.

"I didn't stop to look at that, he was just cheap and I bought him."

"He looks rather pointed over the shoulders and decidedly cat hammed," was my next observation.

"Yes," he said, "an old fellow that used to keep sheep in our county twenty years ago, told me that a ram ought to be sharp on the withers and I never saw a good one that wasn't."

"Well," I said, "if you want to raise something and not particular whether it has wool or mutton qualities, I believe you have pust the sire you are looking for, but if your business is to raise sheep, it strikes me that you have made a bad bargain—even if someone gave him to you, for the only value of a stock ram lies in the qualities that he is able to transmit to his offspring.

Do not think, reader, that is a fanciful tale draw nout of my imagination, but it is an actual happening in the great and wonderful state of Ohio within the past few months, and unfortunately it is by no means an isolated case. Years ago I wondered why there were so few good sheep throughout the country. As I studied the methods of feeding and breeding as practiced by the ordinary farmer, I have begun to wonder why it happens that we have as many good sheep as we do. Lack of care is responsible to a great extent for many poor flocks, but lack of study of the need of the flock from a breeding standpoint is equally repsonsible. I have seen men who thought it well worth while to spend days at a time looking for a suitable sire for their cattle and horses, who are willing to pay good service fees to get one offspring, men who recognized that a good herd boar was a profitable investment, but when it came to their flock of sheep, pursued exactly the same policy of the man who bought the ram at the loading chutes. Never figuring farther than the initial cost of the sheep.

The query was once raised at a meeting of a breeding association as to the amount of money it should cost t obuy a good ram. I would like to reverse this and ask the farmer what it has cost him t obuy a cheap or inferior ram? I am not speaking now in terms of dollars and cents when I say cheap, but in terms of breeding qualities. I am not one of those that thinks a high price makes a valuable product, nor a low price an inferior one. There are exceptions to this rule, but generally speaking, the man who is producing high quality stock can secure a fair price for his product and the man who is producing cheap, inferior stuff is satisfied to sell at any price he can secure. A man asked me the other day what kind of a stock ram he needed and how much he ought to pay for one? My answer to him was that depends all together on the class of ewes you are keeping, what your purpose is in keeping sheep and how much care or attention you are willing to put into them, and this applies to every man who maintains a flock of sheep.

"What kind of a ram shall I use? What kind of a flock have I got? What are the defects that are most prominent in my flock? What undesirable features are there that I wish eliminated? What do I expect to do with my flock, handle it as a wool and mutton proposition or a mutton-wool proposition? Am I willing to give them the care they must have to develop the best there is in them, or do I expect to run them as farm scavengers?" These are the question that every man must answer for himself.

Personally, I have never been very much of an advocate of mixing breeds. If my ewe flock were of the mutton type and had proven profitable, I would secure a ram of the same breed. I would pay particular attention to his mutton qualities and secure as good a fleece as possible in connection with mutton characteristics. No one can afford at present wool prices to overlook the fact that from one-third to one-half of the value of a sheep at the present time is in the wool it produces and there are good grades of medium wools as well as poor grades. It has been my pleasure to have handled some beautifhl clips of medium wool from pure bred sheep with also fine mutton qualities, so there is no quest ion but what it is possible to combine these two of the so-called mutton breeds. We have also handled some clips of wool from the fine wool sheep that really have rankel lower in quality than some of the mutton breeds, and the only reason that they were called delaine or fine clothing was because they were nothing else that we could think of. Had their shrink been lighter, some of these wools would have found a home in the three-eighths and quarter-blood grades, but in nearly every nstance these low grade wools carried a hig hpercentage in shrinkage and reflected the effort on the part of growers to breed a heavy weight of fleece without any attention paid as to quality. This grade of wools known to dealers as X's is found entirely too often amoni the fine wool sheep of the United States, and these coarse fibred heavy shrinking fleeces seem to be on the increase in certain sections.

It is asking too much to throw all these sheep in the discard, and relief must come only through the use of good sires . The expression has often been heard that a ram is half the flock. From a breeding standpoint he wants to go farther than that and say that so far as the improvement and development of the flock is concerned, the rams are the entire flock. A succession of good rams, good care and management being assumed, will develop a good flock from very ordinary foundation. One or two poor rams will ruin the best flock of sheep in the country. It is vitally essential if one wishes to obtain success as a shepherd, to study well the needs of the flock and buy accordingly.

There are cetrain dominant characteristics that all men recognize as essential in the sire, whatever breed your live stock may represent. He must be typically macsuline. He must carry a sire's head. I do not think it necessary to go into those details at this time, as practically every man who writes a letter of inquiry concerning a stock ram is able to describe the ideal sire. All to frequently, however, at the bottom of the page there s a little note, "If you have such a ram at ten or fifteen dollars, please let me know. I do not want to pay over this, as I only have thirty or forty head of sheep to breed."

L'll bet dollars to doughnuts that that man will spend more for tobacca in six months, more for a tire for his jitney, more for a service fee for a colt, more for a one hundred-pound pig than he would for a stock ram that he might use for three years and then sell at a very slight discount under what he gave for him.

So I ask you, reader, to get your ideal type in mind, then if you are breeding mutton sheep that are deficient in back or loin, get a ram that is especially strong there. If they are long necked and light headed, secure and ram with a burly, heavy head and short, massive neck. If they are smaller in size than you desire, use a ram with plenty of stretch and bone, though really it seems that we have worshipped at th shrine of size entirely too much.

After all, what is the most profitable type of sheep? The one that will go to market when it reaches marketable age at a size that meets the most general demands of the consuming public, and fortunately this is not an excessive size. Lambs weighing from eighty to ninety-five pounds at the ages of ten to twelve months and that are good conformation, are generally the market toppers, and it is not necessary to keep over-grown sheep to satisfy this market. Even the fine wool breeds, if properly grown, will duplicate these weights. So if I had a flock of sheep tha tseemed too small to me. I would inqure first as to whether or not it was due to some faulty system of my in keeping or feeding them before I determined on getting an over-sized sire to remedy the defect.

My attention was called some time ago to one of our public institutions maintaining several representative specimens of some of the more popular breds of sheep. Two Shropshire rams were shown with some pride, and their smoothness and mutton qualities and type were emphasized. One of these rams weighed two hundred pounds, the other, if I remember correctly, some ten pounds lighter. Then we were shown a Delaine ram weighing considerably over two hundred pounds. A ram that had neither fleece or form to recommend him, and instead of hearing somewhat of the fleece qualities of the sheep, the entire emphasis was laid on his great size. I am free to confess that for one I was decidedly puzzled to know why that two hundred-pound Shropshire ram should be valued for his conformation and fine fleece quality, while the Delaine natuarlly supposed to be some twenty-five to fifty pounds lighter than the Shropshire and bred primarily for wool should weigh well over two hundred and be valued for his great size and heavy, soggy low grade fleece. Truly a campaign of education is needed.

Every man has heard it said, a ram should carry a ram's fleece. To this I heartily agree, but the kind of a ram's fleece that one ram should carry for one flock may be and often is the very opposite of the kind of a fleece a ram should carry for another man's flock. I do not beleive that any man can afford to use a ram of low grade fleece unles he expects to send his lambs to the butcher before shearing and even then a coarse fleece denotes, as a rule, poor feeding qualities. The vast majority of men seem to think that a ram's fleece means a coarse fibred, unelastic, heavy oiled bunch of wool. The reason that Delaine wool s so valuable for the purpose of making fine clothing is due to the fineness and elasticity or spinning quality of its fibres. When you have bred away from this you have lost the essential characteristics of Merino wools and are producing wools really lower in grade than that produced on mutton sheep because of greater shrinkage in scouring. An effeminate fine ewe fleece has been discriminated against by growers and yet there ar instances where this very style of fleece is very valuable in restoring a coarse fleece bunch of ewes low in quality. I believe this prejudice is due largely to the effort made by breeders some thirty or forty years ago to get away from the fine saxony type of sheep . The advice at that time to breed only a big bold fibred ram well taken because a large number of ewe flocks had been carried so fine that they were losing weight of fleece, length of staple and becoming undersized and weak constituted themselves. I have seen rams at the head of some flocks that I will agree to duplicate their fleece if some one will let me shear a white collie dog after soaking his hair with low grade castor oil, and yet these men have gone on well satisfied to produce this character of wool and talk of their four and five-inch staple which is just as long before being stretched as after.

Judge yourfleece as determined by its elasticity and fineness, and no ram should be used lacking in these qualities. Many confuse fineness of fibre with cramp. Generally speaking the crimp of a ram's fleece should be solider and the fibre somewhat stronger than that of the ewe, provided of course the ewes carry fleeces of good quality.

Question of shrinkage is one that is bound to be considered in the near future, especially so in the change in the methods of marketing wools. No manufacturer wil lpay as much for excessive shrinkage wools as those of lighter shrink of the quality. I have been interested in noting the average weights of the good flocks of Australia and shrinkages. I note one ram shearing over twenty-one pounds of wool when six years old with a shrink of forty-eight per cent., and a flock average of twelve pounds with a shrink of forty-six per cent. Is there a flock of sheep in the United States today carrying that weight of fleece that will not shrink around sixty per cent. I am referring now primarily to fine wool sheep. If it is possible to secure these results in Australia is it not possible to approximate them here? I know you are going to raise the question of climate, etc., but really it seems to me that the main difference has been one of selection of high class sires and systematic effort in the direction of production of good staple, bulky light shrinkage wools. I do not know as to the advisability of attempting to produce wool in the United States with shrinkage of fifty per cent. or less, but am very certain that we could dispense with the rams with a shrinkage of seventy per cent., eighty per cent., or even higher, and I have seen these shrinkages on fleeces that would not weigh over twelve to fifteen pounds in the grease.

Next to a ram's individual characteristics comes the question of hs ancestry. It is very possible that the question of whether it is best to select a ram with high individuality and poor or unknown ancestry is to be preferred to one of poor individuality from high grade ancestry. The safest plan is to let both strictly alone. It is generally accepted as true that no sire can transmit qualities beyond those which he himself possess or has inherited through his ancestors. Careful breeders are inclned to lay greater emphasis on the blood close up in the pedigree of their sires. Given a ram of good breeding and high individuality, his impression should be strongly felt in any flock nor need his usefulness end with the first crop of lambs, because if he were producing to a marked degree of improvement of the flock he can safely be used back on his daughters or possibly better still one out cross, then back to his granddaughters.

Do not neglec to get your breeding ewes into the best possible thrifty condition before the breeding season opens. Ewes gaining flesh at time of breeding give the highest percent-lamb crop.

Jottings From the P.E.I. Department of Agriculture

SCHOOL FAIRS

Prince Edward Island schools have finished holding their fall fairs for 1919. Beginning Sept. 29th four, five and six fairs were held each day until the 40 fairs organized were completed. Fortunately the weather, with the exception of one day, was ideal and all fairs were conducted on the dates as arranged.

School Fairs as a part of the agricultural training in the rural schools were not organized in this province until 1916. As an experiment, 4 fairs were started. These were so well received by the districts that the following year saw the number ncreased to 14. In 1918 the number again increased to 29, and this year to 40.

Objects

1. To interest the children of the schools in the things which are grown on and about the farms.
2. To encourage the production of produce of better qualty.
3. To train pupils to enter into friendly competition.
5. To produce better educated boys and girls.

Orgonization

1. The public school inspectors of whom there were 8 assited the teachers in their organization.
2. A number of schools, from 4 to 7, group into one fair centre.
3. The pupils and one trustee from each school with the Inspector form an advisory committee. Officers from each school are appointed, a prize list drawn out and all arrangements are completed in the spring in order to give the pupils an opoprtunity to prepare exhibits.

Assistance Given to Fairs

The Department of Agriculture through its Rural Science Branch assists the organization: 1st, by supplying a school fair circular containing a suggestive prize list. 2nd, supplying all material required at the fair, such as Secretary's entry book, entry tickets, prize tickets, officers' badges and ribbons for the sports; 3rd competent judges in live stock, vegetables and Domestic Science are sent to each fair. The inspector judges the school work.

No grant as yet has been paid for prixes. The prize money is made up by the schools in various ways, by holding entertainments, selling special contributions, etc. The generous action of the Canadian Bankers' Association in giving $30.00 for calves and pigs when exhibited according to their regulations, is highly appreciated and has resulted in great benefit to live stock industry. It has also suggested to dairy companies a way in which they too could assist in developing their industry, and in 1918 the Tryon Creamery donated $25.00 in prizes for dairy calves. This year the amount was increased to $75.00 and a like abount was voted by the Crapaud Creamery. As a result there was the finest exhibit of dairy calves and yearling heifers, all under 18 months, shown at the Tryon School Fair ever brought together in the province. The interest is extending. The Dunk River Creamery this year voted $28.00 for the same purpose. We cannot attach too much importance to these contests. The boys in striving to win, learn to feed, care for and exhibit, and become intensely interested in live stock. The boys of today are our future farmers, and as the prosperity of an agricultural country depends on its live stock there arises the necessity of giving every possible encouragement to an education that will foster the future increased development of this main industry.

It is gratifying to note the increased interest taken by parents and children in the fairs. The improvement in the exhibits, the better arrangement and management in holding the fair, friendly spirit shown in the sports and best of all, the evidence that each year the exhibitts represent more individual effort on the part of the pupil. The individual effort is further encouraged by the organizing of Pig and Poultry Clubs, which contribute to the exhibits.

ABOUT SHEEP

The Federal Live Stock Department have done considerable advertising of their policy of offering a bonus of $5.00 a year for two years to any one who has never used a pure bred ram in his flock and it was thought that every interested farmer in the Maritime provinces would have noticed this and remembered the terms stated, but it appears that something more is necessary, and from the experience of this office it would seem that only by frequent letters bearing on this subject can the matter be properly kept berore them. The article about "Sheep" I am enclosng, the second of its kind to be published in our Island papers, bronught a large number of fresh enquiries to our office, which is further proof that we must continually have some sort of a reminder face the public of anything we wish them to take up.

Charlottetown, P. E. Island,
October 2, 1919.

To the Editor:

Sheep are universally adimitted to be the greatest weed destroyers of any of our farm animals, and could profitably be kept on most farms in the Maritime Provinces. In fact, any observing person has noticed the alarming increase of weeds on farms where sheep raising has been discontinued for any number of years, as sheep will readily eat a large majority of our mose prevalent weeds, and if closely confined, or on scant pasture, will devour and destroy almost all of them .

The time was (but is happily past) when lambs sold for $1.50 each and wool at 20 cents and less a lb. and this coupled with the ushering in of co-operativ edairyiny were the chief causes of many farmers going out of sheep raising the dairy cow proved a greater profit maker and could be fenced with wire at less cost and trouble. But another and more serious matter soon developed. Several of our old weed enemies and a few new ones began to gain headway on these sheepless farms and their owners began to regret the absence of these industrious little workers. For the past few years many who have neglected breeding sheep for a considerable time began to consider if they could not get their fences in shape and make room again for another flock.

All three Maritime Provincial Governments have offered some little assistance and encouragement to induce as many farmers as possible to again go into sheep raising. The Federal Department is also lending assistance to the entire Dominion by way of a bonus to farmers who have never used a pure bred ram by offering a grant of $5.00 a year for two years, or $10.00 in all, to assist in their purchase, information relating tao which may be obtained by writing to the Department of Agriculture, Charlottetown. The benefits of using a pure bred sire of any kind should now be apparent to anyone, as these animals have been bred, raised, selected, and culled for many years with some special improvement in view that has been an almost inestimable commercial value in the care of sheep, both in the muton and wool. The best evidence of the immense value of the latter is found in the results of the Co-operative wool sales, the best grades of wool selling for over 20 cents a lb. over the coarser kinds, which goes to show what improvement has been accomplished by the breders of pure bred sheep. Not only has the wool, size and quality of mutton been greatly improved, but also the vigor and constiution of these animals are readily noticeable in the first crop of lambs from a pure bred ram or grade or mongrel ewes, and it does not matter how good a grade or scrub ram you may consider you have, it is a penny wise and pound foolish policy to continue using him when a high class pure bred may be obtaned at little additional cost.

Write the Department for any further nformation you wish as to the easiest method of securing a pure bred ram to head your flock.

(Sgd.) WALTER M. LEA,
Commissioner of Agriculture.
Department of Agriculture.

Butter is now selling at some of our best conducted creameries at 57 cents a lb., which would give the owner of profitable dairy cows furnishing the cream a good profit and any who are privileged to be in reach of such a creamery to endeavor if they have no cows freshening this fall to plan to have a few for next winter. It has been proven beyond a doubt that cows coming in in the fall months will produce a greater quantity of milk in the year on the same feed than those fresening in the early spring, due princpally to the fact that the fall beginners will come on grass (about the eighth or ninth month) which is the greatest stimulant as well as one of the best feeds we have, and this will give them a fresh start almost is if they had freshened again, whereas the spring freshened cow will strike dry feed and cold weather at about the same time, consequently cannot maintain such a long milking period. They will also generally be in much stronger and healthier condition after running on the grass all summer than those tied up in the stable. The offspring will also be a stronger, more vigorous calf and be easier raised during the winter months. The work is better divided up in the year. Try one or two cows if you have never done wnter dairying in conjunction with the creamery.

Gleanings From the Nova Scotia Agricultural College

AGRICULTURAL STUDENTS

The College of Agriculture at Truro opens on November 4. Correspondence to date indicates very much larger classes than during the war. Indeed the applicatons to hand now, are from 25 to 50 per cent. higher than at the corresponding date in any previous year. It therefore looks as if the College will have the biggest year in its history. Perhaps at no time in the history of the world has the necessity of good farming been as great as now. We strongly recommend young farmers of the Maritime Provinces to take advantage of the splendid opportunity afforded at this institution. Particulars may be learned from the advertisement on another page of this issue.

WOMEN'S INSTITUTE ACTIVITIES

Among the many interests which have been successfully taken up by the Women's Institutes in this Province, are two which are particularly important just now. One is the improvement of the local school by means of a School Fair, where exhibits in gardening, Domestic Science and skilled handwork of every kind bring out the latent ability of the young folk. In schools where no other opportunity is open to these scholars, competent lades in the community are freely giving their services in lessons and demonstrations along the lines of Domestic Science. Another activity in which several Institutes are interesting themselves is the building of Community Halls as Memorials to the boys who fell at the front.

The Annual Convention of the Women' sInstitute organization will be held in Truro on Oct. 22nd and 23rd. The programme promises to be very atractive, with a number of speakers of wide reputation. One of the features is a course of lectures on Home Nursing, given under the auspices of the St. John Ambulance Association.

THE EGG LAYING CONTEST

Thirty-six entries have been received up to date for the egg-laying contest at Truro. The capacity of the plant is thirty hens. The entries include six pens White Wyandottes; six of Rhode Island Reds; five of Barred Plymouth Rocks; five of Single Comb White Leghorns; two of Anconas; two of Rose Comb Brown Leghorns; one pen each of Rhode Island White, Buff Orpingtons, Single Comb Buff Leghorns, Silver Wyandottes an dBuff Wyandottes. Five pens are as yet unnamed.

The birds have to be in their pens by Oct. 15, but they have until Nov. 1 before records will be kept. All parts of the Province are represented, but the premer place goes to the Glace Bay Poultry Club which has entered seven pens.

Records will be kept of the number of eggs, weight of eggs, kinds and quantities of food used and cost of production. Although a great many breeds are represented, it is not a competition of breeds but rather of strains for egg production. Visitors will be admitted between Oct. 15 and Nov. 1; after the latter date no visitors will be allowed among the contesting pens.

Houses, fencing and other equipment are now all in readiness to receive the birds. Mr. F. C. Elford, Dominion Poultry Husbandman, Ottawa, has visited the pens and states that the equipment is the best he has ever seen. This is no small compliment to the College authorities, since Mr. Elford was connected with the International Egg-laying contest, at Storrs, Connecticut, and with other similar contests in the United States.

NOTES ON CLOVER SEED

It is very gratifying to those who have been watching the clover seed situation to know that large numbers of farmers all over Nova Scotia have saved quantities of clover for seed this season. Market advices indicate that this article will not only be very scarce, but also from 20 to 50 per cent higher than last year's very high price.

A word of warning should go out to those who are undertaking for the first time to save clover for seed. There is always a tendency at the approach of winter to hurry harvesting. Clover should be left until it is quite certain that the seed is mature. The blossoms should be black, and the maturity of the seed can easily be tested by rubbing out a few heads between the hands. It is better not to cut at all than to cut for seed, immature clover. Successful threshings have been made from second growths left until the snow begins to fly.

The Department of Agriculture which, for five years have been sending out a power clover huller to any point where a group of farmers have saved clover for seed purposes, are continuing their policy this year. From applications received it would appear that the Government huller will have a very busy season. Enquiries have come in from communities all the way from Inverness to Yarmouth.

The Department was well advised in forestalling the situation and providing the opportunity for farmers to grow their own clover seed and have it hulled. In addtion, the Department offers a bonus, to any group of farmers who will purchase a huller for use in the community in which they live. One which, several years ago was purchased for Kings County will be largely used this year. Another is being bought by a group of men about River John, Pictou County, this year, and there is a substantial quantity of clover awaiting it in that neighborhood. Those who are unfamiliar with the harvesting and threshing process should write to the College at Truro for information.

FERTILIZING OF PASTURE LANDS

Judging by correspondence received at the College quite a number of farmers will this fall apply fertilizer to at least a few acres of pasture lands. The results from this practice at the Agricultural College Farm are so striking that those who have been watching them feel that many farmers should adopt the practice.

According to their figures the total cost ,including interest on investment, annual charges for fertilizer, fencing and incidentals, is about five cents per pound of gain in live weight. As compared with this cost per pound of gain by stable feeding in winter, was fifteen cents when feeds were at prewar prices.

From now until the snow flies is the proper tme to make the application of fertilizer. Slag or acid phosphates of wood ashes have proven most economical but almost any fertilizer would give results, although it is not good practice to apply a fertlizer which is very rich in ammonia in the Fall, because the ammonia will leach out, whereas the phosphoric acid, potash and lime, which are the principal ingredients in those mentioned above will not leach out, but will become incorporated with the soil during the winter months. These will therefore give better results than would be deriver from a spring application.

CLUB ROT IN TURNIPS

There is much concern throughout the province over the ravages of Club Root. It is estimated that not less than 20% of the entire turnip crop of Nova Scotia has been lost this year through this disease. In some districts farmers are about making up their minds to cease growing this valuable vegetable on account of their losses. This is not at all necessary as there is a simple remedy which can be recommended without hesitation, as it has now passed the experimental stage. The remedy is a good application of lime, if ground lime stone at the rate of four tons to the acre, if ordinary burnt lime, half this quantity.

Experiments at the College Farm, Truro, go to prove that where lime was applied two years ago, in the spring of 1917, there is practically no club root, whereas adjacent lands without the lime application show over 75% of club root infestation. As corroborative evidence the experience of a vegetable grower near Truro may be cited. His turnip plot was very badly infested, almost completely destroyed, indeed, by club root. An adjacent plot was this year planted to cabbage, which is equally subject to this foe, and a quantity of burnt lime aplied as each plant was set out. The cabbage thus treated shows no sign of club root, except a few plants which show infection some five inches below the surface, where the lime did not penetrate. A row of cabbage alongside these is very badly affected.

Thus for an outlay of, say, $20, an acre of ground which is liable to club root may be treated so as to not only protect it from this enemy, but also to increase the yield. The average yield of turnips is about 600 bushels to the acre. 25c. per bushel is a low valuation for the crop either for market or feeding purposes. In other words a crop worth $150 may be practically assured by an outlay of $20.

The lime should be applied this fall on fields to be sown to turnips in the spring. Even better results would be obtained by a period of one, two, or even three years between the application and the crop. This, however, is a matter of simply getting the lime thoroughly incorporated with the soil to a fair depth. For fuller information on the whole question write the College at Truro.

EFFECT OF SALT ON A FIELD OF MANGELS

An interesting result was obtained this year froim the application of common salt to a part of a field of mangels, on the College Farm at Truro. Two plots equally treated in other respects show these results. One had an application of 100 lbs. nitrate of soda and no salt. It yielded at the rate of 899 bushels to the acre. The other plot had 100 lbs. nitrate of soda and 200 lbs. of common salt applied. It yielded at the rate of 1125 bushels to the acre. The applications in both cases were 100 lbs. nitrate per acre, and the salt application 200 lbs. per acre. Thus the salt application increased the yield by 226 bushels, which, at 20c. per bus. represents a gain of $45 for a trifling outlay. The difference in the appearance of the plots was evident to any observer while the crop was growing.

Great Advances Made by the Farming Industry

Tremendous Gains Made in Amount of Farm Products Raised and Export Figures Show Marvelous Strides in Past Few Years

The Dominion of Canada with approximately 450,000,000 acres of land suitable for farming is supremely an agricultural country.

Canada offers greater advantages and opportuniities in her farming industry to the man not afraid of work than any other country. Energy and intelligence are certain to bring results beyond those to be obtained from the investment of an equal capital in any other business.

Of Canada's total area of 2,386,85,600 acres only 106,777,085 acres were, when the last census was taken (1911) in actual occupation, while of the occupied areas, 48,503,360 acres were improved, and of improved areas 30,566,169 acres were under field crop in 1910. These figures show that the Dominion has an enormous area of agricultural land, more perhaps than any other country, Russia alone disputing the supremacy.

Wheat Exports

During the present century Canada has become one of the chief wheat exporting countries of the world, ranking closely in this respect with the United States, British India, Russia and the Argentine Republic. The quantity of wheat and wheat flour expressed as actually exported in recent crop years ended Aug. 31 has varied from 84,531,922 bushels in 1914-15 to 289,794,152 bushels in 1916-16.

The total yield of wheat for Canada in 1918 was returned to the Dominion Bureau of Statistics, Ottawa, as 189,301,350 bushels grown on 17,353,902 lowsacres. The yield of oats in 1918 was 380,273,500 bushels, grown on 14,790,336 acres. Of the remaining grain crops the total yields in 1912 were as follows: Barley, 77,290,240 bushels; Rye, 8,496,700 bushels; Buckwheat, 11,428,500 bushels; mixed grains, 35,730,300 bushels; Corn for husking, 14,214,700 bushels; flax, 5,972,200 bushels; Peas, 3,110,100 bushels; Beans, 3,568,300 bushels. Other crops were: Potatoes, 104,512,700 bushels; Turnips, etc., 130,989,600 bushels; Hay and Clover, 14,661,400 tons; fodder corn, 4,776,000 tons; sugar bets, 180,000 tons; Alfalfa, 446,400 tons.

In the Provinces of Saskatchewan, Alberta and Manitoba the total yields in 1918 were: Wheat, 160,456,100 bushels; Oats, 222,049,500 bushels; Barley, 47,607,400 bushels; Flax, 5,776,000 bushels.

The estimated present value of improved agricultural lands in Canada is $2,792,229,000. The value of farm buildings, $927,548,000 . That of agricultural tools and machinery is $387,079,000, and that of livestock $1,102,261,000.

More Credits Needed

In 1918 Canada exported foodstuffs to the value of $385,746,765, an increase over the exports of 1914 of over 90%. To accomplish this it was necessary to advance credits to Great Britain alone of $294,564,744. And if Canada is to retain the position she has achieved as an exporting and agricultural nation it will be necessary to advance still further credits. Otherwise she will have no markets for her surplus foodstuffs.

For the purpose of enabling Canada to remain in the export market as a great force the Domfinion is asking for funds for the Victory Loan,1919.

The Centerville Exhibition

The Centreville Exhibition, held in the rich agricultural county of Carleton, under the auspices of Agricultural Society No. 44, on September 24th and 25th was, to use the words of the management, "a grand success." Perfect weather prevailed during the two days on which the show was held, and the attendance was all that could be desired.

The entries in each and every department far exceeded that of previous years. There were no fewer than forty pure bred Percherons and Clydesdales, with a good showing in the other classes. There were also over one hundred head of pure bred Ayrshires, Shorthorns, Holsteins and Jerseys, and a large number of grades contributed by local exhibitors. Competition was strong in nearly every class.

The judges of the respective classes were:—Horses—J. F. Frost, Hampton; Cattle—E. McIntyre, Sussex; Sheep and Swine—F. Waldo Walsh, Assistant Live Stock Superintendent, Fredericton; Poultry—R. Kidney, Hartland; Domestic and Fancy Goods—Mrs. E. McL. Hall, Fredericton; Agricultural Products—Wm. Palmer, Scotch Lake; Honey and Horticulture—G. S. Peabody, Woodstock; Dairy Products—Geo. Ransom, Woodstock.

Following is a list of the prize winners:

HORSES

Standard Bred Horses

Stallion, 4 yrs. old—1, B. E. Cliff, Centreville, N. B.

Mare, 4 yrs. old—Dr. F. M. Brown, Centreville, N. B.

Mare, 2 yrs. old—Clover Nook Stock Farm, Hartland, N. B.

Percherons

Stallion, 4 yrs. old—1, C. Allen, Hartland; 2, S. Hamilton, Bath; 3, Holland Estey, Florenceville.

Stallion, 3 yrs. old—1, John Wakem, Greenfield.

Stallion, 1 yr. old—1, W. B. Webb, Centreville.

Brood Mare with foal—1, W. B. Webb; 2, Edner Reid, Knoxford; 3, J. Wakem.

Mare, 3 yrs. old—1, S. T. Gallagher, East Centreville.

Mare, 2 yrs. old—, John Wakem.

Mare, foal—1, W. B. Webb.

Stallion Foal—1, Edner Reid; 2, John Wakem.

Clydesdales

Stallion, 4 yrs. old—1, A. W. Lister, Listerville.

Stallion, 2 yrs. old—1, Clover Nook Stock Farm.

Stallion, 1 yr. old—1, Clover Nook Stock Farm.

Mare, 4 yr. old—1, William Page, Williamstown; 2, William Page; 3, Clover Nook Stock Farm.

Brood Mare with Foal—1, W. S. Cogswell, East Centreville.

Mare, 3 yrs. old—1, W. S. Cogswell.

Mare, 2 yrs. old—1, Clover Nook Stock Farm.

Mare, 1 year old—1, C. A. Simonds; 2 and 3, G. A. Lamoreaux.

Mare Foal—1 and 2, W. S. Cogswell; 3, G. A. Lamoreaux.

Draft Horses

Pr. Draft Horses—1, W. Reid, Knoxford; 2, Frank Sloat, Centreville.

Pr. Draft Horses, 2 yrs. old—1, C. P. Palmer, Woodstock.

Pr. Draft Horses, 1 yr. old—1, William McDonald, Centreville.

Brood Mare with Foal—1, Edner Reid.

Mare or Gelding, 4 yrs. old—1, C P. Palmer; 2, Edner Reid; 3, A. R. Hawkins, Centreville.

Mare or Gelding, 3 yrs. old—1, W. B. Webb; 2, Robert McKay, Centreville; 3, E. W. McLeary, East Centreville.

Foal—1, Edner Reid.

General Purpose

Pr. G. P. Horses—D. Tompkins, Brookville; 2, Edward McCain, Florenceville.

Brood Mare with Foal—1, C. Dickinson, Hartland.

Mare or Gelding, 4 yrs. old—1, J. Dougherty, Centreville; 2, Robert Orchard, Centreville; 3, C. P. Palmer.

Mare or Gelding, 3 yrs. old—1, G. F. Briggs, Centreville; 2, T. Jameson, Knoxford; 3, A. R. Hawkins.

Foal—1, C. Dickinson.

Driving Horses

Brood Mare with Foal—1, Harley Margison, Knoxford.

Mare or Gelding, 4 yrs. old—1, G. A. West; 2, Dr. F. M. Brown.

Mare or Gelding, 3 yrs. old—1, C. P. Palmer; 2, S. Cormier, Centreville.

Mare or Gelding, 1 yr. old—1, S. T. Gallagher.

Foal—1, Harley Margison.

CATTLE

Shorthorns

Bull, 3 yrs. old—1, C. P. Palmer.

Bull, 2 yrs. old—1, W. Reid; 2, N. B. Rogers, Fielding.

Bull, 1 yr. old—1, William Page.

Bull Calf, under 12 months and over 6—1, Harley Margison.

Bull calf, under six months—1, C. A. Simonds; 2, R. McKay; 3, N. B. Rogers.

Cow, 4 yrs. old—1 and 2, William McDonald;; 3, N. B. Rogers.

Cow, 3 yrs. old—1, and 2, W. A. McDonald.

Cow, 2 yrs. old—1, C. A. Simonds.

Heifer, 2 yrs. old—1, C. A. Simonds; 2, Harley Margison.

Heifer, 1 yr. old—1, C. A. Simonds.

Heifer Calf under 12 months, and over six—1, W. A. McDonald; 2, N. B. Rogers.

Heifer calf under six months—1, W. A. McDonald; 2, C. P. Palmer; 3, C. A. Simonds.

Holsteins

Bull, 2 yrs. old—1, Clover Nook Stock Farm; 2, G. A. Lamoreaux.

Bull, 1 yr. old—1 and 3, J. I. Gallagher, East Centreville; 2, Clover Nook Stock Farm.

Bull calf under 12 mos. and over six—1, Clover Nook Stock Farm; 2, G. A. Lamoreaux.

Cow, 4 yrs. old—1, Clover Nook Stock Farm; 2, G. A. Lamoreaux; 3, J. I. Gallagher.

Cow, 3 yrs. old—1, J. I. Gallagher.

Cow, 2 yrs. old—1 and 2, J. I. Gallagher.

Heifer, 2 yrs. old—1, Clover Nook Stock Farm; 2, G. A. Lamoreaux.

Heifer, 1 yr. old—1, Clover Nook Stock Farm; 2, J. I. Gallagher.

Heifer calf under 12 mos. and over six mos.—1, J. I. Gallagher.

Heifer calf under six months—1, J. I. Gallagher; 2, Clover Nook Stock Farm.

Ayrshires

Bull, 4 yrs. old—1, A. W. Lister.

Bull, 3 yrs. old—1, F. B. Pelkey, Landsdown.

Bull, 2 yrs. old—1, Clover Nook Stock Farm.

Bull, 1 yr. old—1, A. A. H. Margison; 2, Edward McCain.

Bull calf under six months—1 and 2, A. A. H. Margison.

Cow, 4 yrs. old—1, G. F. Briggs; 2, A. W. Lister; 3, A. A. H. Margison.

Cow, 3 yrs. old—1, E. W. McLeary; 2, Clover Nook Stock Farm.

Cow, 2 yrs. old—1 and 3, A. A. H. Margison; 2, F. B. Pelkey.

Heifer, 2 yrs. old—1, A. W. Lister.

Heifer, 1 yr. old—1, A. A. H. Margison; 2, A. W. Lister; 3, E. W. McLeary.

Heifer calf under 12 mos., and over six—1, E. Hoyt; 2, B. Clark, Centreville; 3, A. A. H. Margison.

Heifer calf under six months—1, A. W. Lister; 2, A. A. H. Margison; 3, Clover Nook Stock Farm.

Jerseys

Bull, 4 yrs. old—1, A. R. Hawkins.

Bull, 2 yrs. old—1, C. R. Smith, Lakeville.

Bull, 1 yr. old—Hamilton Reid, Centreville.

Cow, 4 yrs. old—1, A. R. Hawkins; 2 and 3. H. Reid.

Cow, 3 yrs. old—1, H. Reid.

Heifer, 2 yrs. old—1, H. Reid.

Heifer, 1 yr. old—1, H. Reid; 2, A. R. Hawkins.

Heifer calf under 12 mos. and over six—1, A. R. Hawkins; 2, Burton Clark, Centreville.

Heifer calf under six months—1, A. R. Hawkins.

Grades and Crosses

Cow, any age—1, Beecher Clark; 2, W. A. McDonald; 3, P. Simonds.

Heifer, 2 yrs. old—1, R. Orchard.

Heifer, 1 yr. old—1, David Burtt, Centreville.

Shorthorn Cow—1, Percy Simonds, Tracy Mills.

Shorthorn Cow, 1 yr. old—1, W. A. McDonald.

Shorthorn Heifer Calf—1, W. A. McDonald; 2, H. Estabrooks, Centreville.

Holstein Cow—1, G. A. Lamoreaux; 2, Frank Sloat.

Ayrshire Cow—1, Burton Clark.

Ayrshire Heifer, 2 yrs. old—1. Frank Sloat.

Ayrshire Heifer, 1 yr. old—1, W. A. McDonald.

Ayrshire Heifer Calf—1, David Burtt.

Jersey Cow—1, W. B. Webb; 2 and 3, David Burtt.

Jersey Cow, 2 yrs. old—1, W. B. Webb.

Jersey Heifer, 1 yr. old—1, Horace Estabrooks; 2, Frank Sloat.

Jersey Heifer Calf—1, Dr. F. M. Brown.

SHEEP

Lincoln Ram, 2 yrs. old—1, H. Weade, Royalton; 2, G. A. Lamoreaux.

Lincoln Ram Lamb—1 and 2, C. A. Simonds; 3, G. A. Lamoreaux.

Pr. Ewes—1, C. A. Simonds; 2, G. A. Lamoreaux.

Pr. Ewes, 1 yr. old—1, G. A. Lamoreaux.

Pr. Ewe Lambs—1, G. A. Lamoraux.

Dorsets

Ram, 2 yrs. old, Ram Lamb, Pr. Ewes, Pr. Ewes, 1 yr., Pr. Ewe Lambs, all 1st prizes won by Clover Nook Stock Farm.

Shropshire Downs

Ram, 2 yrs. old, Ram, 1 yr. old, Ram Lamb, Pr. Ewes—all 1st prizes won by Clover Nook Stock Farm.

Oxford Downs

Ram, 2 yrs. old, Ram, 1 yr. old, Ram Lamb, Pr. Ewes, Pr. Ewe Lambs—all 1st prizes won by Clover Nook Stock Farm.

Leicesters

Ram, 2 yrs. old—1, Edward McCain; 2, W. Page.

Cotswolds

Ram, 2 yrs. old—1, W. S. Cogswell.

Ram Lamb—1, W. S. Cogswell; 2, E. W. McLeary.

Pr. Ewes—1, E. W. McLeary.

Grade Sheep

Pen of 4 Ewes—1, W. A. McDonald; 2, Dr. F. M. Brown; 3, W. B. Webb.

Pen of 4 Ewe Lambs—1, H. Weade; 2, W. A. McDonald; 3, Dr. F. M. Brown.

Pr. of Ewes—1, Frank Sloat; 2, W. A. McDonald.

Pr. of yearling Ewes—1, W. B. Webb; 2, W. A. McDonald; 3, Dr. Brown.

Pr. of Ewe Lambs—1, E. W. McLeary; 2, F. Sloat.

Fat Ewe—1, W. A. McDonald; 2, R. McKay.

Nannie Goat—1, Walter Bramley.

Chesters

Breeding Sow with pigs, 2 yrs.—1, A. A. H. Margison.

Breeing Sow, 2 yrs. old—1, R. McKay; 2, W. Page.

Sow Pig—1, A. A. H. Margison; 2, R. McKay; 3, W. Page.

Boar Pig—1, J. I. Gallagher; 2, R. McKay.

Boar, 1 yr.—1, G. A. Lamoreaux.

Tamworths

Boar, any age—1, Clover Nook Stock Farm.

Breeing Sow with Pigs—1, Clover Nook Stock Farm.

Sow Pig—1, Clover Nook Stock Farm.

Grades an Crosses

Breeding sow with pigs, 2 yrs. old—1, W. B. Webb.

Sow Pig—1 and 3, W. B. Webb; 2, J. I. Gallagher.

POULTRY

B. P. R. Cock—1, W. J. Page; 2, A. R. Hawkins.

B. P. R. Hen—1, W. Page; 2, David Burtt; 3, A. R. Hawkins.

B. P. R. Cockerel—1 and 3, W. Page; 2, A. R. Hawkins.

B. P. R. Pullet—1 an 2, W. Page; 3, S. Niles, Centreville.

W. P R. Cockerel—1, 2 and 3, G. E. Wilson, Centreville.

W. P. R. Pullet—1, 2 and 3, G. E. Wilson.

W. L. Cock—1, C. Sullivan, Centreville; 2, W. S. Cogswell.

W. L. Hen—1, C. Sullivan; 2, H. Weade; 3, W. S. Cogswell.

W. L. Cockerel—1, C. Sullivan; 2, H. Weade; 3, G. Smith.

W. L. Pullet—1, C. Sullivan; 2, H. Weade; 3, G. Smith.

B. L. Cock—1, W. S. Cogswell; 2, A. J. Lee.

B. L. Hen—1, W. S. Cogswell; 2 and 3, A. J. Lee, Centreville.

B. L. Cockerel—1, A. J. Lee.

B. L. Pullet—1, A. J. Lee; 2, W. S. Cogswell.

W. W. Cock—1, G. Smith; 2, H. Weade; 3, J. I. Gallagher.

W. W Hen—1, J. I. Gallagher; 2, G. Smith; 3, H. Weade.

W. W. Cockerel—1 and 2, J. I. Gallagher; 3, G. Smith.

W. W. Pullet—1 and 2, J. I. Gallagher; 3, G. Smith.

R. I. R. Cock—1, A. J. Lee; 2, A. A. H. Margison.

R. I. R. Hen—1, A. J. Lee; 2, A. A. H. Margison.

R. I. R. Cockerel—1, A. J. Lee; 2, A. A. H. Margison.

R. I. R. Pullet—1, A. J. Lee; 2, A. A. H. Margison.

Pr. Toluce Geese—1, Percy Simonds.

R. I. R. Breeding Pen—1, A. J. Lee.

R. I. R. Breeding Pen Chicks—1, A. J. Lee.

W. P. R. Breeding Pen—1, G. E. Wilson.

W. L. Breeding Pen—1, C. Sullivan.

W. L. Breeding Pen, Chicks—1, C. Sullivan; 2, A. A. H. Margison.

B. M. Breeding Pen—1, F. B. Pelkey; 2, C. Sullivan.

W. W. Breeding Pen—1, J. I. Gallagher.

W. W. Breeding Pen, Chicks—1 and 2, J. I. Gallagher.

B. P. R. Breeding Pen—1, W. Page; 2, A. R. Hawkins; 3, S. Niles.

B. P. R. Breeding Pen, Chicks—1, A. R. Hawkins; 2, Beecher Clark.

B. L. Breeding Pen, Chicks—1, A. J. Lee.

B. M. Cockerel—1, C. Sullivan.

B. M. Hen—1, F. B. Pelkey.

B. M. Pullet—1, C. Sullivan.

Geese, any breed—1, Percy Simonds.

G. Campine Cock—1, Dr. F. M. Brown.

G. Campine Hen—1 and 3, Dr. F. M. Brown; 2, A. J. Lee.

G. Campine Cockerel—1, 2 and 3, Dr. F. M. Brown.

G. Campine Pullet—1, 2 and 3, Dr. F. M. Brown.

S. C. Ancona Cock—1, Dr. F. M. Brown.

S. C.Ancona Hen—1, 2 and 3, Dr. F. M. Brown.

S. C. Ancona Cockerel—1, 2 and 3, Dr. F. M. Brown.

S. C. Ancona Pullet—1, 2 and 3, Dr. F. M. rown.

Sicilian Buttercup Cock—1, Dr. F. M. Brown.

(Continued on page 74)

Some Points in Successful Sheep Breeding

Dr. H.B. Arbuckle in American Sheep Breeder

When success in sheep raising is so dependent upon proper mating and handling it seems strange that so many men are careless about certain fundamental principles that underlie the whole business.

Let's discuss briefly these essential matters.

The ewe flock deserves close attention. Just any sort of ewes can not be depended upon to bring good results. Many men are satisfied to turn rams into a flock of most any sort of ewes. This is a foolish policy. There can be no argument for keeping absolutely unprofitable ewes in a breeding flock, for it will cost just about as much to winter them as it does to winter the profitable sort. Ewes that have gotten too fat to breed is not a common trouble in grade flocks, because the ewes have raised lambs and have not been pampered. However, very fat ewes that have failed to raise lambs for two years in succession should be sent to the butcher. All ewes with defective udders should be rejected. Ewes of weak constitution that are apt to remain too weak to handle their lambs have no place in the flock. Even in a grade flock it is important to retain ewes that are strong, good feeders, good in bone and well covered. The culling of the ewe flock is the first sound principle of successful breeding and it pays to attend to this first.

If you are handling a pure bred flock, you should have an eye to the production of ram lambs and ewe lambs. When I was in England a few years ago, I visited a large flock of pure bred sheep that was most carefully divided into two parts. The heavy boned, coarser ewes were to be mated to the ram that would be best suited for producing the ram lambs, while the more refined, neater ewes were mated for the ewe lambs. The outstanding success of this breeder is proof that the method is worth trying.

When you have gotten your ewe flock properly divided, you should strive to bring the flock into good breeding condition by the time of mating. The date of mating must be determined by local conditions.

It may not always be best to have your lambs dropped in the early winter, as you may not have suitable equipment in barns and feed to get through very cold, bad weather with a lot of young lambs. Lambs that are dropped about two weeks before grass comes often grow off so quickly that they overtake lambs that are a month earlier. This is because the ewes freshen up better and supply their lambs from the very start with an abundance of milk, which is the thing that counts in lamb raising. Unless you know what you can do, you had better not breed for early lambs. This year I had a ram lamb dropped on March 15 that weighed 145 lbs. on August 1, and he was a twin at that. He never knew what it was to be hungry.

The next sound principle is in selecting the proper ram and making sure that he is not only pure bred, but well bred. It never pays to use a grade ram. It would be going too far aside to discuss the characteristics of the dependable ram, as this is a big subject in itself.

Suffice it to say that he must be outstanding in masculinity and eager for his work and must be bred right. I know of nothing so foolish as for a man who wants to get good lambs, deciding to take a grade ram, because he can be had for less money. Everyone knows the ram is more than half of the flock, and the "better ram" slogan is the real secret of making a success of this thing of sheep breeding. Let me give you one instance of failure, which came under my observation, which may drive it home: I once loaned a neighbor a fine Dorset ram to prove to him what Dorset blood would do for producing lambs. He had a wonderful lot of lambs and he bragged on them everywhere he went. Among the lambs were two big ram lambs that weighed at four months almost 140 lbs. each and they were dandy lambs. The man said he knew he could never buy a pure bred Dorset ram as good as these, so he kept them for breeding. They were large and vigorous, but he never figured on that half of their inheritance that called for small bones, narrow shoulders, contracted chest and light hams. Their free milking mothers passed this on to them by the inexorable laws of nature along with the wonderful growth that abundance of milk had supplied. The result was pitiable to behold. The lambs came small of bone and lacking in uniformity, and the man blamed it on Dorset blood. Was this right? It will work this way every time, and I can conceive of no more foolish policy than that of trying to save money on the ram that is more than half of the flock.

If this man had brought the right sort of Dorset ram, he would have paid for him twice over by the additional weight of his lambs, to say nothing of hi ssatisfaction of having a lot of lambs he would never be ashamed to show to his friends.

This, in my judgment, is even more essential than having the ewe flock right, for nothing is more astonishing than to see what a really good ram can do with a flock of mediocre ewes.

The next point is in getting the ram in proper condition for the hard strain of the breeding season. I do not think that any ram will give the highest success that is in a run down condition. If your ram is thin, he should be carefully fed for the month before mating, using principally protein food, such as oats and bran, so he will be in strong condition and on edge for the game. He should have plenty of exercise, which is impossible for him to secure in a small lot. It is a wise policy to continue his feeding, until the breeding season is over, for you do not want him run down in the winter. Winter care of the ram is another strong point for the next season's success. This thing of turning the ram out to hustle for himself and find his feed at the straw stack can not be condemned too severely.

The last point I want to impress upon you is probably the most neglected of all. For the best results the ram should be hand bred, that is, he should not be allowed to run with the ewe flock. The ewes should be brought to him and he should be allowed to serve each ewe only once.

The ewe should be marked and turned out not to come back again for three weeks. This not only preserves the strength of the ram, but insures stronger lambs and more certain service. I have seen a ram serve one ewe twelve times in a single day. Often three or four ewes are in at the same time, so it is no wonder that many ewes miss the first service. From actual experience I can say that a ram that is bred in the way I suggest will handle sixty ewes with more ease than thirty by the common method and the results will be far better. If we think enough of our bulls and stallions to observe this simple plan of conserving strength, do you not think it wise to do as well by your rams. If you use this method, you can afford to pay more for a good ram and use him on as many ewes as you could use two ordinary rams on, when turned with the flock. Of course, it is useless to urge the importance of never turning two or more rams out into the same flock of ewes.

If you have never tried the method suggested, try it this season and see what results you will get. Your lambs will come all together and will be stronger. You can practically breed every ewe in good condition in the flock in a period of thirty days and then you can take the rams away and your lambs will not be strung out over a long period.

Here is hoping you will have the greatest crop of lambs you have ever known.

Prize Essay on Dairying

Two years ago a Dairy Essay competition was begun in Nova Scotia on the basis of instruction given in the Schools. Prizes were provided by progressive farmers, Agricultural Societies, bankers and business men. This year a Grand Prize was offered by the Dairymen's Association of N. S. for the best essay in the whole Province. This prize has been won by Master George MacKay, Marshville, Pictou County., and his essay is given below.

THE COW AND HER PRODUCTS

In the last few years dairying has taken a place in the front rank of Canadan industries. In 1917 $190,000,00 worth of milk and milk products were sold from farms in Canada. In that year 1,760,371 pounds of butter were manufactured in Creameries in Nova Scotia. The immense food value of this is realized when we consider that butter generates three and two-thirds times as much energy as the same amount of beef steak does. There was also a good deal of cheese and condensed milk made, besides the raw milk and cream consumed in towns and cities and in the country.

If we fill a bottle with milk and let it stand for two weeks we see that it divides into three parts, cream on top, water in the centre and the curd below. It is the cream that contains the butter-fat, of which whole milk contains about 4%. It is in the form of tiny gobules and is divided into two classes, "Volatile and Non Volatile Fats." The "Volatile" fats which form the smaller part are easily dissolved and pass off in gas. They are important in that they influence the keeping qualities of butter.

There is also about 87% of water in milk, 4¾% sugar, 3% casein, 2/5% albumen and ¾% ash made up of potash, lime, soda, magnesia and iron. All these ingredients are very important in nutritive value.

Now we see that milk is a wonderful thing, so we conclude that the cow is also wonderful. She is like a machine which takes raw materials in the form of food and water and turns them into milk, therefore she needs careful attendance. The food given to a cow to keep her in condition is known as the "Maintenance Ration" and all food given over this ration is turned into milk. The most difficult food to get is protein which contains nitrogen. Commercial foods such as "Oil Cake Meal" have large quantities of this and also total nutrients. The food must be in a form that the cow will ike . Spring grass is the best natural food for the cow, but, as she cannot have this the year round, she must have substitutes. The root known as Swedes is very suitable here, but if enough of these cannot be had "Ensilage" may be used. Ensilage is some green plants such as oats, peas and vetches cut up fine and put into an airtight box called a silo. This food when well preserved has a high nutritive value and the cows eat it readily.

A cow also needs a large supply of good fresh water which she must get without too much exposure in winter. She should be watered at least twice a day. As cows need Oxygen to make right use of their food the stable must have lots of fresh air. Each cow needs a volume 14 ft. x 14 ft. x x14 ft. of fresh air each day. In modern barns the foul air is carried to the roof by a flue, while another somewhere near the floor carries in the fresh air. These are constructed to give the proper circulatoin of ai without chilling the stable. Then the stable must be well lighted having 5 to 7 square feet of glass for each cow, also each cow must be bedded with straw or some other litter.

Everything in the stable and dairy including the cow must be kept clean. The cow's udder should be wiped with a damp cloth before milking and everything with which the miik comes in contact must be scalded twice a day to kill any bacteria which tend to sour the milk.

Cattle are known as breeds when they come from different countries and possess characteristics which separate them from others.

The Breeds are divided into three classes, "Dairy Breeds," "Dual Purpose Breeds" and "Beef Breeds." Of these the "Dairy Breeds" interest us most. They are Jersey, Guernsey, Holstein-Freisian, Ayrshire, Dutch-Belted, French Canadian and Kerry. The Jersey gives the richest milk of all these breeds. She came from the Island of Jersey in the Channel Isles. The Guernsey came from the Island of Guernsey and although she gives a larger amount of milk it is not as rich as the Jersey's. The Holstein-Friesian originated in Holland and is a good cow on good pastures. The Ayrshire came from Ayr in Scotland, and will thrive where no other cow could. The other breds in this class are seldom found in Nova Scotia.

Of the Dual class the Shorthorn is the most mportant, many being found in this province as meat and milk producers. This breed is suposed to have originated in the Northeast of England.

A movement has been started to make it mor convenent for farmers to have their cows tested, by having testing stations in certain centres. One of these stations has ben started in this place (Marshville) by Mr. H. R. Brown, Supervisor of Cow testing for Nova Scotia, and has proved successful.

GEORGE MacKAY,
Grade X.
Marshville School, Pictou County.

Windbreaks are a very desirable addition to any farm. Plan now for one if it is not already there.

HOW LOSSES FROM FARM FIRES CAN BE PREVENTED

The number of fires that annually occur brings enormous losses, many of which could have been prevented. These losses, in certain instances, were not total, being partially covered by insurance. Nevertheless, a loss by fire is a serious drain on the resources of the whole country, being just so much valuable property that is absolutely gone for good.

The causes of most rural fires may be numerous: Among the most common and frequent might be fires resulting from lightning, spontaneous combustion, overheated stoves and bad chimneys, fires caused from sparks from engines, carelessness in the use of matches, kerosene and gasoline. Any person can mention other causes, some no doubt peculiar and unusual, which may cause the loss of valuable property.

Losses from lightning striking farm buildings may be greatly reduced if the buildings are properly rodded. After a fire of this kind the following may be heard repeatedly, "Was the building rodded?" and nine times out of ten the answer is, no. Also ask an insurance man if he would not rather take a risk on a barn that is rodded and see what he says. The added protection and safety that one feels by having the buildings rodded is well worth the cost of this protection.

People, although knowing the danger, often start fires as the result of carelessness. Matches are left in places where small children have access to them and as a result buildings are destroyed and lives sometimes lost. Then, there are certain people who insist on pouring coal oil on fires, saying that they have done it dozens of times, but there is danger and the next time may result seriously. Gasoline is very treacherous and a spark from a room that is saturated with the vapor may explode and start a fire that will spread very rapidly.

Then we have out-door fires started from burning brush, cinders from engines, and burning stubble that cannot be kept under control. In timber regions the losses from these fires have been enormous and here, organization for fighting rural fires is needed perhaps more than in any other instance. City residents are afforded the protection of an organized, drilled fire company but there is little fire-fighting equipment found in most rural districts for the protection from fires of various origins.

In certain districts rural organization for fighting fires has proved effective. The plan is something like this: The members of the company, upon being informed of a fire, drive to the fire with all possible speed. Behind their car is a trailer carrying the needed fire-fighting equipment. The trailers carry chemical extinguishers, buckets, axes, shovels and other tools, the equipment needed depending upon the kind of a fire. The cost of these outfits is not so large but that they might be provided in any farming community where sufficient interest is taken. With the aid of the telephone and automobile a rural fire can be quickly reached by a large number of farmers and a little organization along the lines of fire fighting would sometimes save buildings that formerly were destroyed for want of help.

After every disastrous fire agents come round selling insurance and seeking to rod your buildings and they usually do a good business, too. However, this does not help the one who has suffered the loss. Every farmer might be the next one to suffer loss.

Sometimes losses from fires cannot be prevented by human aid, but carefulness in the use of all inflammable and explosive materials, seeing that buildings are rodded and promoting a rural fire-fighting organization in your community will do much towards checking and preventing fires and bringing down the insurance rates. O. L. I.

FARM FIRE INSURANCE

Adequate insurance on buildings, contents and live stock should be a matter of careful concern with every farmer. This is a subject which comes very much to the fore just at this season of the year, when practically the whole of the season's crop is in the barn, and the thunder-storm menace is still very much in evidence. Up-to-date safeguards calculated to condust stray lightning bolts to earth by a safe route, sometimes work wonders and at other times evidently do not work at all. Case after case is on record where valuable farm livestock have been killed in the pasture field by similar "bolts from the blue." Farm buildings of modern fireproof construction may be a thorough protection from fire losses in many ways, still they offer little guarantee against damage to contents in the case of a fire that may start in the barn itself. In view of this no farmer cas afford to slight the matter of insurance against fire, no matter how small may seem his chance of incurring loss from this source. Paying a fire-insurance premium on a practically fireproof barn may appear a little like overdoing the habit of "playng safe", but all the same it may prove to be a very choice "ounce of prevention."

But though the number of farmers who ignore the question of insurance altogether may be very small, it is certain there are a much larger number who carry an insurance policy, which is entirely inadequate to give even a fair measure of protection against fire losses. Many men who had thought their property fairly well insured have received rather a rude jolt, when after suffering the misfortune of a fire have figured up their loss, and balanced it against the amount due them on their policy. It has been said—and perhaps there's more truth than fiction in it—that it takes a fire to show many a farmer what his stock and equipment really are (or perhaps were) worth.

In short then, an adequate, well-proportioned fire insurance policy, placed with a reliable firm, is one of the investments a farmer cannot afford to pass by.

UNSIGHTLY VIEWS ABOUT THE FARM

There is no excuse, in many instances, for having unsightly views about the farm home. There are few old buildings but what can be removed or remodeled and made presentable, brush heaps can be burned, old fences repaired, and many places can be improved so as to add to the attractiveness of the place. It is often advised to plant trees, shrubs or vines to hide or cover up these homely places on the farm, but a better plan is to remove the homely things that detract from the beauty of the farm home. Some may regard the poultry house a homely thing, and in such case it can be hidden from view by shrubs, if the family so chooses. But a poultry house that is a disgrace and needs hiding, is not a fit place to "bring up" poultry. But the shrubbery along the poultry house is not bad for it would serve two purposes—hiding the house from view and providing shade fo rthe chicks on hot days. Sometimes a discarded old building or a broken fence has greeted the eyes of the farmer so long that he has ceased to even think about them, but the stranger coming onto the place soon sees where improvement could be made. Don't let buildings stand until they rot away and fall into ruin. Tear them down and if the lumber is worth preserving store it away for future use, and if it is not fit for such purpose, turn it into stove wood. Many a farmer's wife would be happier if she had some pretty views to greet her as she goes about her work.

A SCOT IN THE SHOW RING

A Scotch lad who was starting for the country fair to exhibit a herd bull received these instructions from his father: "Show The Duke for all you are worth, from the minute you take him out of his stall until you get back." Good advice that, and characteristic of the proverbial earnestness and thoroughness of the Scot. Slouchy work, including the showing of animals, is too common, and always the experienced showman has an advantage over the beginner in presenting his animals for the scrutiny of the judge. He is on the job every minute of the time, for well he knows that the judge may be watching the style and action of each bull as it leaves the arena, and walks to the stables. The first-prize animals will come back for the championships, and must therefore be kept in mind by the judge, and he does not readily forget if a winner that appeared almost perfect in the ring humps and waddles painfully when relaxed and headed for the barns.

* * *

Most of the conveniences of the city home are now available in the country. A farmer can have an electric lighting plant in his cellar or woodhouse to furnish him light and power, running water in his kitchen and bathroom, and a septic tank in his back yard to take care of the sewage wastes from the house. The septic tank is one of the greatest conveniences the farmer can install. It provides for the disposal of sewage in a safe and sanitary way with practically no expense after the tank has been constructed. There is no better way for taking care of sewage wastes except the city sewage system which is available only to a limited number of farmers.

Enthusiasm is a lubricant that makes the wheels of trade go round; a grouch is sand in the bearings. Enthusiasm, like factory melancholla, is catching.—Elbert Hubbard.

Prize Winners at the Chatham Exhibition

HORSES

Hackneys

Stallion, 3 years—R. A. Snowball, 1.
Stallion, 2 years—Wm. M. Johnston, Newcastle, 1.
Filly, 3 years—Wm. M. Johnston, 1 and 2.
Stallion, any age—Wm. M. Johnston, medal.
Mare, any age—Wm. M. Johnston, medal.

Standard Bred Horses

Filly, 3 years—R. Cox, Loggieville, 1.
Foal of 1919—Geo. E. Fisher, 1.
Brood mare with foal, Dr. Marven, 1.
Mare, any age—R. Cox, 1.

Clydesdales

Stallion, 4 years—R. A. Snowball, 1, 2 and 3.
Stallion, 1 year—R. A. Snowball, 1.
Filly, 3 years—R. A. Snowball, 1 and 2.
Stallion, any age—R. A. Snowball, medal.
Mare, any age—R. A. Snowball, medal.
Stallion, 4 years (Canadian Bred.)—R. A. Snowball, 1 and 2.

Percheron

Stallion, 2 years—Wm. Main, Rexton, 1.
Filly, 3 years—Wm. Main, 1.
Stallion, any age—Wm. Main, 1.
Mare, any age—Wm. Main, 1.

Carriage Horses (to Halter)

Filly or gelding, 3 years—R. A. Snowball, 1.
Yearling filly or gelding—Hotel Dieu Farm, 1.

Carriage Horses (to Harness)

Matched Pair—Wm. M. Johnston, Newcastle, 1; Maher Bros., Chatham 2.
Single horse—A. E. Corbett, St. John, 1; A. S. Cameron, Douglastown, 2; J. Fred Benson, Chatham, 3.
Best horse, any age—Jos. Napier, Redbank, medal.
Mare or Gelding—Harold D. Baldwin, Douglasfield, 1; J. D. Johnston, Chatham, 2.

Light Draught Horses

Mare or Gelding, 4 years—J. Frank Jardine, Chatham, 1; Geo. J. Dickson, Chatham, 2; Jas. Stothart, Ferry Road, 3.
Mare or Gelding, 3 years—R. A. Snowball, 1.
Filly or Gelding, 2 years—Hotel Dieu Farm, 1 and 2.
Filly or gelding, 1 year—R. A. Snowball, 1; Geo. J. Dickson, 2.
Matched team—R. A. Snowball, 1.

Heavy Draught Horses

Mare or gelding, 4 years—Mir. Lumber Co., 1; John M. Baldwin, Douglasfield, 2; R. A. Snowball, 3.
Mare or gelding, 3 years—R. A. Snowball, 1; Mir. Lumber Co., 2; John Irving, Douglasfield, 3.
Filly or gelding, 2 years—Mir. Lumber Co., 1.
Brood mare with foal—Mir. Lumber Co., 1 and 2.
Foal of 1919—Mir. Lumber Co., 1 and 2.
Matched team—Mir. Lumber Co., 1; R. A. Snowball, 2.
Mare and 3 of her progeny—Mir. Lumber Co., medal.

Ponies

Mare or gelding, 13-14 hands—R. A. Snowball, 1.
Mare or gelding, 12-13 hands—R. A. Snowball, 1.

CATTLE

BEEF RBEEDS

Shorthorns

Bull, 3 years—R. A. Snowball, 1.
Bull, 12 months—R. A. Snowball, 1.
Bull calf, (over 6 mos.)—R. A. Snowball, 1.
Bull calf, (under 6 mos.)—R. A. Snowball, 1 and 2.
Cow, 4 years—R. A. Snowball, 1, 2 and 3.
Cow, 3 yrs.—R. A. Snowball, 1 and 2.
Cow, 2 yrs.—R. A. Snowball, 1.
Heifer, under 2 yrs.—R. A. Snowball, 1.
Heifer, under 18 mos.—R. A. Snowball, 1.
Heifer calf under 12 mos.—R. A. Snowball, 1 and 2.
Heifer calf under 6 mos.—R. A. Snowball, 1 and 2.
Breeders' herd—R. A. Snowball, 1.
Young herd—R. A. Snowball, 1.
Bull any age—R. A. Snowball, medal.
Female any age—R. A. Snowball, medal.
Cow and 2 calves—R. A. Snowball, medal.

Polled Angus

Horne Bros. of Winsloe Station, P. E. I., won all the prizes in this class—13 firsts, 5 seconds and 4 medals.

DAIRY BREEDS

Ayrshires

There was a good showing of this favorite breed, owned by three exhibitors, McIntyre Bros., of Sussex; John Retson of Truro and George E. Fisher. All the sections were filled and the prizes awarded as follows—McIntyre Bros. 13 firsts, 9 seconds, 4 thirds, 2 fourths, 4 medals; Retson, 4 firsts, 4 seconds and 1 medal.

Jerseys—There were two exhibitors of this popular breed of cattle, J. R. Semple & Son, Truro, N. S., and R. A. Snowball, Chatham. The different sections were well filled and awards made as follows:—Semple, 6 firsts, 1 second, 1 third, 3 medals; Snowball, 3 firsts and 1 medal.

Holsteins—Five exhibitors in this class divided the awards as follows: Dickie Bros. Truro, N. S., 12 firsts, 4 seconds and 2 medals; Wm. M. Johnston, Newcastle, 1 third; P. S. Bremner & Son, Chatham, 1 second; Nelson Agricultural Society, 1 first; Hotel Dieu Farm, 3 seconds, 2 thirds and 1 fourth.

Brown Swiss—The several sections in this class were filled by herds owned by W. J. Jolley, Waterloo, Que., and Ralph H. Libby, Stanstead, Que., and the prizes divided as follows:—

Jolley—7 firsts, 8 seconds, 1 third, 4 medals.

Libbey—8 firsts, 2 seconds, 5 thirds, 2 fourths and 2 medals.

Grade Cattle

Beef Grades—In this class, two exhibitors divided the prize money, R. A. Snowball taking 3 firsts and Geo. J. Dickson, 2 firsts.

Dairy Grades—This class had six exhibitors, and prize money was awarded as follows: Hotel Dieu Farm, 2 firsts; A. G. Dickson, 2 firsts and 1 seconds; R. A. Snowball, 1 first.

Fat Cattle—No awards.

Mixed Breeds—Cow, 4 years, R. A. Snowball, 1; J. Fred Benson, 2; calf under 1 year, Geo. J. Dickson, 1; Heifer under 6 months, R. A. Snowball, 1.

Special Classes

Hackneys—Best stallion, any age, R. A. Snowball, 1.

Clydesdales—Best stallion, best female, gelding or mare, in harness, pair in harness—R. A. Snowball, 1.

Ayrshires—4 animals, get of 1 sire—McIntyre Bros., Sussex, 1 and 2.

2 animals, progeny of 1 cow—John Retson, Truro, 1 and 2; McIntyre Bros., 3 and 4.

Senior Heifer—McIntyre Bros., 1.

Junior Bull—Retson, 1; McIntyre Bros., 2.

SHEEP

Cotswolds—In this class the only exhibitor was J. Horne of Winsloe Station, P. E. I., who captured all the awards.

Leicesters—There were three exhibitors in this class and awards were made as follows: S. L. Boswall, Pounal Lot, P. E. I., 6 firsts, 4 seconds, 3 thirds; John Retson, Truro, 2 firsts, 3 seconds, 1 third.

Lincolns—All the animals in this class belonged to Albert Boswall, French Fort, P. E. I., and the judge awarded all prizes offered, viz., 7 firsts, 6 seconds and 3 thirds.

Oxford Downs—Wm. McKenzie, Lower Napan, 1 first; George L. Boswall, French Fort, 1 first, 1 second.

Shropshires—A. Ayre, Hampton, Ont.; G. L. Boswall, French Fort, P. E. I., and J. H. King & Son, Sussex, divided the money in this class as follows: 2 firsts, 1 second, 3 thirds; 4 firsts, 2 seconds, 4 thirds; 2 firsts, 5 seconds, 1 third, respectively.

South Downs—The awards were divided between A. Ayre, Hampton, Ont., and Cephas Num, Winsloe, P. E I. The former had 8 firsts, 6 seconds, 1 third and the latter 1 third.

Hampshire Downs—Cephas Num and Lorne Num of Winsloe, and G. R. Ward, West Bathurst, took all the awards as follows: 7 firsts, 2 seconds, 3 thirds; 6 seconds, 2 thirds; 1 first, respectively.

Cheviots—The exhibits of A. Ayre, Cephas Num, Geo. M. King and Robert Furness, Vernon, P. E. I., carried off all the awards in this class.

Dorset Horns—Geo. L. Boswall, 5 firsts, 5 seconds, 2 thirds; A. Ayre, 3 firsts, 2 seconds, 1 third; S. M. Smith, Bathurst, 1 second; R. A. Snowball, 1 third.

Suffolks—J. Horne and A. Horne of Winsloe took all the awards in this class.

Grades (long and medium wool)—All awards in these classes were won by R. A. Snowball, A. Ayre and Cephas Num, also being exhibitors in the medium wool class.

Fat Sheep (long wool)—R. A. Snowball, 1; A. Boswall, 2.

Fat Sheep (medium wool)—Cephas Num, 2 firsts; Bremner & Son, Chatham, 1 second, 1 third; G. Boswall, 1 second; R. A. Snowball, 1 third.

Grades—(North'd. Co.), Snowball, 3 firsts, 1 second; Bremner, 1 first; Hotel Dieu Farm, 1 second.

Wool on Fleece—Cephas Num, 2 firsts; John Retson, 1 first, 1 second; John King, 1 first, 1 second, 1 third; Geo. Ward, 1 second.

SWINE

Yorkshire—Boar over 2 yrs.—Hotel Dieu Farm, 1.
Boar, over 1 yr.—A. G. Dickson, 1; Geo. E. Fisher, 2.
Boar, under 1 yr.—Hotel Dieu Farm, 1.
Boar, under 6 mos.—James Stothart, Ferry Road, 1; A. G. Dickson, 2.
Sow, over 2 yrs.—A. G. Dickson, 1.
Sow over 1 yr.—L. Dickson, Ferry Road, 1; William Godfrey, Napan, 2; H. McEwen, Ferry Road, 3; Hotel Dieu Farm, 4.
Sow, under 1 yr.—A. G. Dickson, 1.
Sow, under 6 months—Jasper Cable, town, 1; Clarence Searle, town, 2; A. G. Dickson, 3.
Sow with litter—A. G. Dickson, 1 an 3; Geo. E. Fisher, 2.
Herd—A. G. Dickson, 1.
Chester—No entries.
Berkshire—J. R. Semple & Son, Truro, 8 firsts, 4 seconds, 1 third; Hotel Dieu Farm, 2 thirds.
Tamworth—No exhibits.
Poland China—Ralph H. Libby, Stanstead, Que., the only exhibitor, took 6 first prizes.
Duroc Jersey—No exhibits.
Fat Pigs—Fat hog, Hotel Dieu, 1 and 2; A. G. Dickson, 3.
Spring Pig—Wm. Weldon, town, 1 and 2; Geo. J. Dickson, 3.
Grades—Sow, under 1 yr.—E. F. Harper.; Chatham Head, 1; Hotel Dieu Farm, 2 and 3.
Sow, under 6 months—Geo. J. Dickson, 1; Jack Bremner, 2 and 3.

Yorkshires—(Open to Boys Breeders' Clubs).
Sow, over 1 yr.—L. Dickson, 1; Willard Godfrey, 2; H. McEwen, 3.
Sow, under 1 year—L. Dickson, 1; Clarence Searle, 2.
Barrow, under 1 yr.—H. McEwen, 1.

POULTRY

The poultry exhibits were numerous and representative of practically all the breeds for which awards were offered. In addition to the usual large number of outside exhibitors, there were more local entries than at any previous exhibition.

The awards were: C. R. Forbes, South Devon, 12 firsts, 8 seconds; Jas. Stickles, North Devon, 8 firsts, 5 seconds, 5 thirds; W. S. Swetman, Moncton, 14 firsts; W. Bailey, Fredericton, 7 firsts, 7 seconds, 2 thirds; P. D. Morgan, Fredericton, 7 firsts, 5 seconds, 2 thirds, 1 fourth; R. H. Libbey, Stanstead, Que., 8 firsts, 4 seconds; R. P. Allen, Fredericton, 4 firsts, 3 seconds, 3 thirds; J. N. Ferguson, Fredericton, 2 firsts, 2 seconds, 2 thirds, 2 fourths: A. V. Gilson, Moncton, 4 firsts, 2 seconds; A. Boon, North Devon, 3 firsts, 1 second; L. B. Johnston, Nashwaaksis, 2 firsts, 1 second; W. Collier, Chatham, 2 firsts, 1 second, 1 third; Clarence Searle, Chatham, 2 firsts, 1 fourth; Mrs. George Danby, North Devon, 1 second, 2 thirds; Hotel Dieu Farm, 3 seconds; John Dee, Chatham, 1 third; C. A. McFay, Fredericton, 2 seconds.

Live Utility Poultry—(not exhibited in other classes)—Plymouth Rocks, barred cock, James Martin, Chatham, 1; H. McEwen, Ferry Road, 2.
Barred hen—Sadie Payne, Bathurst, 1; H. McEwen, 2; R. Pallen, 3.
White Wyandotte hen—Mrs. G. Danby, 1.
Rhode Island red cock—Fred Gibbs, 1.
Rhode Island red hen—Walter Bailey, 1 and 2.

Live Utility Poultry—Special

Charlotte Co.—Hazel Reed, 4 firsts, 1 second; Alice Lever, both of Rolling Dam, 1 first, 3 thirds.
Kings Co.—Kathleen Price, Butternut Ridge, 2 firsts.
Queens Co.—No entries.
Sunbury Co.—Letitia Patterson, Hoyt Station, 5 firsts, 1 second.
York Co.—Jesse O'Leary, 3 firsts.
Northumberland Co.—Hazel McEwen, 5 firsts; Clarence Searle, 2 seconds.
Westmorland Co.—No entries.
Carleton Co.—No entries.
Other Counties—Hattie Steeves, Elgin, 2 firsts, 2 seconds; Winifred Goggin, Elgin, first and second; Sadie Payne, Bathurst, 2 thirds, 1 fourth.
Ducks—Pekin, under 1 year, A. V. Gilson, 1 and 2.

Dressed Poultry

Mrs. Wm. Scott, Ferry Road, 1.

EGGS

Brown—J. Frank Jardine, 1; John Dee, 2; Mrs. F. Manderson, Loggieville, 3.
White—Mrs. Wm. Scott, Ferryville, 1.

DAIRY PRODUCTS

Butter—Box of 56 lbs., Farmers' Co-operative Co., Moncton, 1; C. M. Johnston, Bedeque, P. E. I., 2.
Box of prints, 20 lbs.—Johnston, 1; Co-operative Co., 2.
Tub of 15 lbs.—Milton Galloway, town, 1; Mrs. Ralph Searle, town, 2; Mrs. James Godfrey, Black River Bridge, 3; John A. McNaughton, Black River Bridge, 4; Mrs. Wm. Scott, Ferry Road, 6; Mrs. J. P. Burns, Bathurst, 7.

HORTICULTURE.

WINTER APPLES AND THEIR CARE

As winter apples are expensive, it is important that the buyer an consumer should, when laying in the winter's supply, obtain varieties that will be in best condition successively through the winter. He should also keep his apples so as to lose as few of them as possible from over ripeness or rotting. As soon as the fruit is received, it should be put in the coolest place available without frost. A temperature from 32 degrees to 35 degrees Fahr. is best. If there is a choice in the house, that with the moisture atmosphere, such as a cellar without a furnace, would be the better for the air is too dry for keeping apples well in many houses.

If the apples are in good condition, they may be left in the barrel or box. If, however, they show signs of rotting they should be sorted, and the unaffected specimens wrapped in tissue or newspaper which lessens the danger of any rot spreading. If the room is very dry it will be better to put them back in the barrel or box after wrapping as they will shrivel less than if more exposed to the air. It is important to keep the fruit in clean receptacles, otherwise they may absorb unpleasant flavors.

Among the best varieties of apples in good condition early in the winter are Fameuse or Snow, Ribston Pippin, Hubbardston Nonsuch, Tompkins King, Jonathan, Grimes Golden and McIntosh Red. The Fameuse and McIntosh Red are two of the most popular dessert varieties. These are both in good condition in November, but, while the Fameuse does not keep well, as a rule, much after the New Year, the McIntosh grown in some districts will keep in good condition until March. Ribston Pippin, Hubbardston and Tompkins King are three more apples of high flavor for November and December, or later. Jonathan, while not grown to any extent in Canada outside British Columbia, is shipped East in boxes. It also comes from the Western States and can be depended upon until about the New Year. It is a handsome apple of good quality. After the New Year the Northern Spy is, perhaps, the most popular apple in Canada, but as the supply is limited and they can be kept until late in the winter or spring, some of the sorts which do not keep well much after midwinter may be used first. Among such are Rhode Island Greening, Baldwin, Wagener and Esopus Spitzenburg. For late winter and spring, in addition to Northern Spy, varieties which are usually available are Golden Russet, Roxbury Russet or Nonpareil, Stark and Ben Davis, and, in boxes from the West, Yellow Newton, Stayman Winesap and Rome Beauty. Stark and Ben Davis are the least desirable for dessert purposes, and Stark is not acid enough for the best cooking. There are other good varieties.

KEEPING BIENNIAL VEGETABLES FOR SEED

By the term "biennial" vegetable is meant one which takes two seasons to produce seed, writes the Dominion Horticulturist in a leaflet giving advice on the "Selection and Wintering of Biennial Vegetables for Seed" which can be had free from the publications branch, Department of Agriculture, Ottawa. The vegetables must be stored over the first winter and replanted for seed production the following spring. Some well-known vegetables of this class are beets, cabbage, carrots, celery, parsnips, salsify and turnips. Seed from these can be easily grown in Canada if vegetables to be so used are kept in good condition over the winter. Unless a rigid selection is made each year of specimens which are true to type, it will not be long before a larger proportion of the crop will be not true to type; hence great care should be taken to select well-shaped, medium-sized roots typical of the variety of beets, carrots, parsnips, salsify and turnips, firm-headed cabbage true to type, firm stalked and disease-resistant plants of celery and firm, shapely onion bulbs. If this is done and varieties are kept far enough from others so that they will not cross the crop, Canadian grown seed should compare favorably with imported seed in regard to purity as it does in other characteristics.

The methods of wintering vegetables for seed will vary in different parts of Canada, but in most places it will be necessary to give them some protection. When possible, it is best to store them in a frost-proof cellar. But, if necessary, the vegetables may be stored outside, both in small and in large quantities, except in the case of onions, which must be kept dry, and stored in a cool place where there is little or no frost.

FALL PLOWING IN THE ORCHARD

(Experimental Farms Note)

After the apples are harvested there is generally a slack time when the orchard plowing may be done to advantage. Experience has indicated that shallow plowing is advisable in orchard practice and that it is unwise to go deeper than five to six inches and that the area close to the base of the tree should not be plowed deeper than thrree to foue inches. There is as a rule little cultivation after the first of July, and from that time on even if cover crops are not grown a natural growth of some sort will have been made. This growth when turned under affords practically as good mulch as if left on the surface, and the fact that the ground has been loosened up tends to prevent as deep freezing as if left compact, for the more compact the soil the deeper will frost penetrate it. Where root killing of trees is liable to occur, it may be wise to leave the cover crop mulch undisturbed as it assists materially in holding snow and as a result will give a better cover than if plowed in the fall. Other than this there does not appear to be any disadvantage in fall plowing as to possible winter injury from root killing. The great advantage is that a certain amount of work is out of the way for next spring, and should the spring be unfavorable for working land the discing may be delayed much longer than it would be wise to delay plowing. Early orchard cultivation is of prime importance, and as it is usually necessary to plow once to work under accumulated vegetation, this should as far as possible be done in the fall, thus facilitating early spring work and hastening bacterial activity the next spring.—W. T. Blair, Supt. Experimental Station, Kentville, N. S.

WINTER STORING VEGETABLES

Vegetables that can be stored for winter use in the fresh state are carrots, beets, parsnips, salsify, turnips, rutabages, potatoes, onions, khol-rabi,

Stromberg-Carlson TELEPHONES

For City, Village and Farm

These are the ideal instruments for local or long distance work.

When you talk over a Stromberg-Carlson telephone you immediately sense its clear, powerful transmitting qualities. Transmitter and receiver are standard commercial instruments that give perfect satisfaction over local or long-distance lines.

Your message goes over the wires with distinctness. High efficiency and convenience are characteristics of every Stromberg Telephone.

SEND FOR FREE BOOK No. 95

It describes all Stromberg Apparatus. Explains how to install and take care of your telephones. Tells how to organize and equip a party line among your neighbors and explains just why the experience gained in building over 2,500,000 Stromberg Telephones guaranteee the kind of service you need.

Send for this Free Book and put your problems up to our engineers—they will plan your system and furnish estimates without cost.

cabbage, celery, squash, pumpkins and tomatoes.

Vegetables that are slightly immature are better for storage than those thoroughly mature as they are of better quality and keep longer. Vegetables for storage should those thoroughyly mature as they are of better quality and keep longer. Vegetables for storage should be harvested carefully to avoid bruising and should contain no diseased or rotten spots.

Proper temperature, moisture content and ventilation are essential for the successful storing of vegetables. Practically all vegetables — except squash and pumpkins should be given a low temperature. Root crops may be kept plump and fresh by covering the mwith moist sand or soil or by keeping the atmosphere moist. Celery should be planted close together in boxes containing several inches of sand or soil which should be kept moist constantly. This keeps it alive and induces the tender stalks to grow. Celery can be kept until after Christmas by this method. Parsnips and salsify roots can be left in the ground over winter to be dug early in spring.

Squash and pumpkin should have a temperature from 40 deg. to 60 deg. F. and a dry atmosphere. Tomatoes that are still green or only partly colored at the time the first frost threatens may be stored by pulling the vines, hanging them in a warm place in the cellar and picking off the tomatoes as they ripen, or by picking the tomatoes from the vine and laying them away in a cool place.

Root crops, cabbage, celery and onions will tolerate a considerable amount of frost, though they should be protected from frost as much as possible. When vegetables are frosted in the field they should not be handled till thoroughly thawed out, which should be done slowly. If frozen in storage most of these vegetables may be utilized if used promptly after being thawed out.

THE FARM POLICEMAN

The staunch policeman of the farm is
Blue Sulphate O'Copper;
He tackles mildew, rot and rust—oh,
he's a fungus-stopper!
He does his best detective work disguised as Bordeaux mixture;
If treated well he'll come to be upon
your farm a fixture.
If you employ this constable, and
watch his evolutions,
You'll soon attend the funeral of
fungus' dissolutions.
Six pounds of sulphate, hang in bag,
in gallons six of water;
In gallons four of water slake four
pounds quicklime for mortar.
These two concoctions then you mix—
or keep as stock solutions—
With water now dilute four times before you start ablutions.
Stir up the mixture or the stuff will be
precipitated—
This constable will work the best
when greatly agitated.

—M. G. Kains.

ARSENIC POISONS

The value of an insecticide is based on its power to kill or to repel insects. An ideal insecticide may be said to have the following qualities.

1. It must kill the insect before the latter can seriously damage the plant.
2. It must not possess any properties which will cause injury to the plant.
3. Its cost must be sufficiently low to permit its use in large quantities.
4. It must spread and stick well to the surface to which it is applied.
5. It must remain sufficiently well in suspension to permit of a uniform coating of poison on the sprayed parts.

Arsenic, the base of all important insecticides now used against chewing insects, is a substance which cannot by itself be used with safety on plants because of its tendency to burn the foliage. In combination with other substances, it acts as a poison to insects but does not cause harm to plants unless in a liberated form as arsenic oxide.

PRODUCING FINE ROSES

Most persons simply allow roses to grow from one year to another without giving them any special attention, an these people often wonder why it is some certain persons can have extra fine roses growing in their gardens.

The secret of the matter lies in the fertilizing of the rose. The soil should be made rich with the food needed to produce the best possible bloom. Early in the season it is best to dig round a rose bush that has been growing in one place for a few years, and mix with the soil some poultry manure and stable manure, with a little sand to help keep the earth from becoming too hard.

If a bed is prepared for new rose bushes, it should be made deep and very rich. Remove the earth to a depth of two feet and fill in with very rich soil as well as strong manure.

In constructing a new bed for roses, avoid the use of manure that will heat very much. Sheep manure, and leaf mold mixed with stable manure and a good quality of garden loam will produce a fine lot of roses. While the bed is being constructed it will pay to place a few old bones in among the manure.

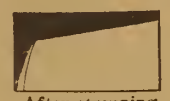
LEAVES WORTH SAVING

In this period of general economy an of war gardening, the leaves that fall from city trees should not be burned. A pile of dry leaves makes a pretty bonfire, but the same pile of leaves put where the wind will not scatter them, weighted with a few shovels of earth over them, if that is necessary, will keep them until next spring, when fertilizers are needed for the garden. Those who intend to plant gardens next spring will do well to conserve the leaves they rake from their own lawns, or any leaves anyone will allow them to rake up and cart away.

A cork will often get pushed into a bottle while it is still full and causes no little annoyance, as it is almost impossible to get it out. An easy way out of the difficulty is to thread a button on a string and drop it inside the bottle. Pull the cork up to the neck of the bottle with the aid of a hatpin, then pull the string which is attached to the button and the cork will come out.

?

Before stropping (magnified)



After stropping (magnified)

Which blade is yours?

You shave with the first blade—unless you use an AutoStrop Razor. Shaving causes a saw-like edge to form and the blade becomes dull. Stropping re-aligns the edge and brings the blade back to original keenness. That's why men of judgment select the AutoStrop Razor; they realize that no razor can do good work without constant stropping. If you doubt this, ask a barber. Take a barber's strop from him and he'd have to close up his shop.

Why then put up with dull blades, needless expense, half-removed stubble, and a smarting sense of discomfort—penalties imposed by a non-stropping razor?

The AutoStrop Razor strops itself without removing the blade; it is cleaned without taking it apart; while the self-stropping feature makes for shaving comfort by preserving the keen edge that makes close, even shaving possible.

Drop in at your dealers the next time you're in town and ask to see the AutoStrop Razor. There is no obligation to buy; and no obligation to keep an AutoStrop Razor if it doesn't please you. Everywhere—razor, strop and 12 blades, complete, $5.00.

AutoStrop Safety Razor

Fit our Fighters to Farm

The Soldier Settlement Board of Canada needs the help of thousands of public-spirited farmers in affording prospective soldier settlers an opportunity of gaining sufficient agricultural experience to insure their success.

Many Veterans of the Great War are qualified by physical and general fitness for farm work. They are ready to respond to the Call of the Land and contribute to Canada's agricultural greatness.
But a number of them lack practical experience in farm operations and consequently, fail to qualify for a loan under the provisions of the Soldier Settlement Act.
It is the privilege of Canadian farmers to supply the assistance they need by taking one or more of these soldiers on their farms and giving them the benefit of their experience and advice.
Men are now awaiting an opportunity to gain experience during the winter months. Will you help them? If so, write the Soldier Settlement Board.

DAIRYING

QUIET HANDLING OF DAIRY COWS PAYS

Dairy cows should be handled as quietly as possible at all times. Anything which is inclined to create excitement is very likely to decrease the flow of milk. The first thing necessary for the cow is contentment, which means plenty of the proper food to eat and an abundance of clean, fresh water to drink. When conditions are such a normal flow of milk may be assured, but as soon as these things are violated the milk decreases and the dairyman is the loser. This may be caused by various things. Some men make a practice of continually having a dog with them when they are around cows. This is a very poor practice because most cows hate dogs and are often greatly excited by them which causes them to hold all or part of their milk.

Another bad thing among a herd of cows is a noisy milkman; one who yells at the cows to stand around, chases them out of the barn with a pitchfork and more than likely to the pasture with the aid of a dog.

If a cow takes a dislike to a man she is spoiled as far as that particular man is concerned. She may show her temper by kicking him out or else simply refuse to give him her milk; if this continues any length of time she will soon be too near dry to be profitable. Every time a man loses his temper with a cow, he does so at his own expense.

Flies are another evil which cause much decrease in milk flow. They are, in summer, a constant evil which is not so easily remedied but much may be done to releive the cows of them. There are many kinds of fly dope which wil relieve them for a few hours. This is worth while for the milking period and acouple of hours longer, enabling the cow a chance to get her fill of grass before she has to fight flies. Flies stay in the light. They may be prevented a great deal in barns by darkening the windows and doors. This can be done by covering them with dark cloth or tarred paper. A curtain can be hung at the door to brush off the flies as the cow enters the door.—H.O.P.

DAIRY BULL MUST BE PREPOTENT

"I understand that 47 per cent. of the cattle in Eastern Canada are scrubs," was the remark made at the opening of the Ottawa Valley Holstein Breeders' Sale at the Central Canada Fair, by Dr. S. F. Tolmie, Minister of Agriculture for the Dominion of Canada. This is true if pure-bred cattle, as well as the grade mixtures of blood that are wasters of feed, labor and time wherever they are bred or reared. There is many a dairy bull playing his part as head of the herd of cows which would bring more profit and much less loss if he were sent to the butcher without hesitation. He may be actually engaged in lowering the production of milk and butter fat in the herd, and his owner is often none the wiser till it is too late.

Pure bred sires have long been recognized as of unquestionable value in developing profitable herds. In dairy cattle, the only true criterion of a sire's worth, is the realtive average yearly production of his daughters as compared with that of their dams. Improvement in type is usually associated with an increase in milk and butterfat production, although it does not always folow. The monetary value of introducing improved blood through the sire has been demonstrated beyond doubt on practical dairy farms.

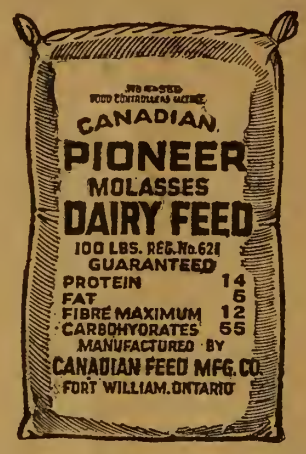
Using ordinary cows as a foundation, dairymen have been able to approximately double the production of milk and buttrefat in two generations through the use of pure bred sires. The result has been accomplished, not by using high priced sires but through the use of good individuals from yearly record dams.

In dealing with animals which are distinctly inferior to the best types in existence, fixation of heredity and rapid improvement can be carried on simultaneously . The method is grading up by th econsistent use of sires of a given strain of a given pure breed. In th eprocess of grading up scrub stock or the similar process of improving an inferior pure bred herd, pepotency of the male as a producer of high record animals is most import ont. The only method by which prepotency can be obtained is close breeding accompanied with selection, In this connection it is important to note that selection based on the progeny is more effective than selection based on individual merit. Males which are good enough to breed at all should be saved long enough to determine their prepotency.

The way to fix a type or strain to make it prepotent is by close breeding, accompanied by careful selection, and by this means inferior stock may be graded up to the level of the desired strain by the use of prepotent males. It is popularly expressed by many farmers that close breeding is not all that is claimed for it. But it entirely depends on the constitutional quality of the animals chosen for grading up, and fixing milk production in a strain by close breding, whether it will be a success or not. Such a system of breeding would lead ultimately t oa situation in which most of the breeding stock of the country would belong to closely bred strains, each strain having as its nucleus a family of highly improved pure bred animals.

But such closely bred strains cannot last, for in time fertility and constitutional vigor are apt to decline in spite of the care taken to keep it up. In order to overcome this difficulty, outcrossing with other closely bred strains has to be resorted to, and the process of grading and fixing again repeated. There is little chance that animal breding will ever settle into a rigid system. The system that produced all the great breeds was that of close breeding, and close breeding is still followed. The importance of grading up common stock is becoming more and more widely understood. Grading up pure breeds is just as necessary and is accomplished in the same way as grading up of common stock.

To grade up common stock it is just as necessary to have a well graded pure bred sire to lead the herd as it is for the owner of pure bred cows. Pure bred sires of proven prepotency are the safest investment a live stock breeder can make. Even for common cows care should be exercised to secure a bull whose ancestry are known to be good producers, not merely for seven or thirty days, but for yearly and even lifetime production. If the dairy herd is to be maintained at a high average production,selection will be found to be wellnigh indispensable. A whole herd of high producing cows cannot be secured by any other method. The pure bred prepotent sire from high producing ancestors is the sure way to own a high porducing herd.



Stock Food in Winter

Keeps Stock Healthy and Efficient

IN winter when the stock are in close quarters, they cannot obtain the nourishing green pasture and lose out on the necessary protein, fats and carbo-hydrates to keep them in the best condition.

Supply these nourishing elements they cannot obtain. Give the stock Canadian Pioneer Stock Foods. They tone the system, purify the blood and keep your stock producing and giving its best. Ask for Canadian Pioneer.

Shropshires and Cheviots

We are offering for fall delivery a number of Shropshire Rams, both Shearling and Lambs, and as well a few splendid Ewes.

In Cheviots we have a limited numher of very choice Rams to offer.

The largest Pure Bred flock of Shropshires and Cheviot Sheep in the Province, also largest prize winning flock in the provinces at the Fall Fairs.

JOHN H. KING & SON, Sussex, N. B.

PROPER CARE OF THE MILKING MACHINE

In the production of pure milk with a milking machine, great care is necessary in the handling and washing of the machine. Milk that is allowed to become dry on the parts is very difficult to get off . To avoid this, as soon as the last cows are milked and the milk emptied, but while the pump is still running, cold water should be drawn through the teat cups into the can. The machines should then be removed to the dairy and dismantled. The can covers to which the pulsator is usually attached should be washed, wiped dry and hung up. The teat cups and tubes should be washed in hot water to which has been added some alkaline washing powder. This will dissolve any fats adhering to the parts. Once a day, a brush should be used on the interior of th teat cups. These parts should now be put into a sterilizing solution until next milking time. Once a week, the teat cups and attached rubbers should be taken apart and thoroughly washed in hot alkaline water with special brushes supplied for this purpose. The cans may be handled with the rest of the dairy utensils in the ordinary wya, steaming or scalding and draining in a room free from dust being important.

On taking the teat cups from the sterilizing solution for the next milking ,they should be rinsed in fresh, cold water and then be assembled. At this stage, the drawing of scalding water through the teat cups into the cans would have a beneficial effect but is liable to injure the rubber. When adjusting the milker and attaching the teat cups to the cow's teats, be careful not to draw barn air through the tubes into the can. In shifting the machine from one cow to another and changing the cans, let the milk and cans be exposed to the barn air as little as possible.

One of the best sterilizing solutions to use is composed of chlorite of lime. Use fresh chloride of lime, preferably from sealed tins, and provide an earthenware crock. Into this put one pound of chloride of lime and add a gallon of cold water. Break up the lumps, stir thoroughly, and then allow to settle. Cover and keep in a cool place. This is a stock solution and only the clear liquid off the top is to be used. In making up the solution for the teat cups, use one pint of this solution to every ten gallons of water. As the sterilizing action gradually decreases, add another half pint of the stock solution every three or four days as long as this solution is kept in use. The old solution should be emptied out and a new solution made as often as is necessary to keep it clean. A new stock solution should be made at least every two weeks.

The keeping of the outside metal parts of the teat cups and pails bright is not so important, but improves the appearance of the machines. For this purpose such polishing substances as Bon Ami, Dutch Cleanser, etc., may be used.

THE STORY OF THE DAIRY COW

Making milk is quite a complex process with th cow and while she is going forward with it from day to day she must be gently treated or her nervous system is deranged, and as a result, she cuts down th milk flow and you will notice the loss in the milk pail. Every comfort must be given her in the way of handling and stabling, pastruing, in season, and to do her utmost and stand up under the strain she must not want for the smallest thing her appetite or bodily comfort craves. If she is stabled on a board floor without bedding, is irregularly fed, knocked on the rump with a milk stool, whipped and yelled at until she is so nervous she wants to jump into the manger or through the stanchion—if these things are forced upon her she is going to make her owner pay well for the privileges he enjoys. Just take yourself into the barn of any first-class dairyman and look about for yourself. You will see cows contented and peaceful, chewing their cud, resting, apparently doing nothing—except making milk. Especially among highbred cattle, will harshness shown them be seen to result in a lessened milk supply. A heavy milker is always one that is highly strung in nervous temperament. She is just as hardy, as strong and as willing as the loafing cow that takes your rough treatment. A cow that has to lie down on a cold, unbedded floor runs chances of injuring her udder by the cold. She soon learns to stand rather than lie down and be quiet as she should be. Then she becomes restless and shifts about and may step on the udder of the cow lying next to her. Many a cow has been injured in just this way.

Regular feeding is very important. When feeding time approaches a good cow begins to move about in her stall or stanchion and look for the feed. If she is kept worrying about it she will not give the greatest amount of milk, because the demand of her digestive organs is not responded to with food. Habit has much to do with this also. Let a feeder who does not care when he feeds and milks, take charge of a herd which has had punctual attention, and right away the flow of milk runs down and unless the owner finds out the reason the flow is never recovered.

Force the cows out on a raw day in late winter or early spring and make them stand, humped up in the wind, or go foraging down the lane and into the woods and take a good, soaking, cold rain or two and you'll get no milk. An abundance of unchilled water in winter and cool in summer is one of the very important cow comforts. Salting regularly is another. A cow is a very peculiar factory into which is taken the raw stuff and from which she turns out a highly finished product. Everything she needs to make the most output is an important cog in the wheel and if omitter she fails to do perfect work, just like a machine does with a broken cog. Don't forget this or your milk check will show it.

ONE CHEESE THAT WEIGHS 31,964 POUNDS

What is reported as the largest chese ever manufactured n the world was recently completed for Armour & Company, of Chicago, for exhibition at the National Dairy Show to be held at Chicago Oct. 6 to 12, 1919. The cheese is 8 feet high, 10½ ft. in diameter, 33 feet in circumference, and weighs 31,964 pounds. It required 357,000 lbs. of milk 800 pounds of salt, 1,251 ounces of rennet, $260 worth of bandages, and is valued at $16,000. The curd was furnished by 59 factories, was made by 73 cheese makers, and the milk was drawn from 12,000 cows on 1,800 farms. Motion pictures have been taken of the cheese, as well as the process of manufacture, and they will be shown throughout the world.

Foresight is better than hindsight, is ever so much cheaper in the long run, and causes les sick headaches.

The Basis of Profitable Dairying

The influence of feed on the production of milk is striking. No matter how good the individual dairy cow is, the quantity of milk she yields is, within wide limits, directly dependent upon the feed she receives.

If a cow is subjected to feed of poor quality, unpalatable and indigestible, no matter how much she may be fed, she is sure to go away down in her production and will not yield any profits. Such a cow becomes a "boarder"—that is why our experts have compounded a mixed feed, properly balanced according to the needs of the dairy cow, rich in milk-producing nutrients, with a high percentage of these nutrients in digestible form.

Monarch Dairy Feed

a rich feed, but not too concentrated to feed alone and when fed liberally to dairy cows it will get the highest production possible with the least cost. There is no wastage in Monarch Dairy Feed—every pound has milk-producing value in it and more of it goes to the actual production of milk than of other feeds because such a high percentage of it is digestible.

Monarch Dairy Feed is composed of Oil Cake Meal, Cotton-seed Meal along with Bran, Barley feed and Corn feed. The mixture of Oil Cake and Cotton-seed Meals counteracts the constipation that would be caused by Cotton-seed Meal if fed alone.

Give Monarch Dairy Feed a trial and if the dealer in your district does not handle it, send us his name and we will see that you get it. By ordering early you will assure delivery when needed.

LIVE STOCK.

CALF RAISING, HOW DONE MOST ECONOMICALLY

Calves which are so reared as to attain ample size, constitution and capacity are most valuable. Hence economical rearing is the attainment of these desired characterists at the least possible cost. No matter how good the calves are at birth they may be stunted and ruined as future producers, or else reared at a loss, if not most carefully.

The following basic principles in calf rearing are well proven:—

1. The only sure way of herd improvement is to rear the best calves which are sired by a good pure bred sire.
2. Poor calves of poor breeding are not worth rearing.
3. Calves inheriting size, vigor and constitution are reared most cheaply.
4. The safest way of keeping a herd free from tuberculosis and abortion is to rear it.
5. The calf reared on its dam costs 25 to 50 per cent more than the pail-fed, whole-milk calf unless land and pasture are very cheap.
6. Whole-milk, pail-fed calves cost two or three times as much at six months of age as calves fed skim-milk, butter milk, whey or calf meal.
7. Skim-milk is the best single substitute for mother's milk, but if not available may be replaced with buttermilk, whey, or a good calf meal.

Feeding the Young Calf

Dairy calves had better be taken away from the cow at birth and not allowed to suckle unless weak, unable to drink, or if the cow's udder is very severely inflamed. It is essential that the calves receive their mother's milk for the first four days, at the rate of eight to ten pounds, divided into three or four feeds. Continue the whole milk for three weeks, at which time start replacing a part of the same with skim-milk so that when the calf is six weeks of age it may be receiving 12 to 14 pounds of skim-milk with two ounces of the flaxseed jelly or a good calf meal which is a cream substitute.

When calves are three weeks of age, start feeding a small quantity of whole oats in the manger, also commence feeding a small quantity of fine clover hay and give them an opportunity to drink clean cold water at least twice per day.

The whole oats fed dry in the manger should be replaced at the end of two weeks' feeding with a grain mixture composed of equal parts bran and crushed oats, or bran, crushed oats and ground corn. This dry grain should be fed to calves five weeks of age at the rate of one-eighth pound per day, increased gradually to one and one-half pounds per day.

If skim-milk is scarce, it may be taken out of the ration at four months. Gruel feeding with or without whole milk, skim-milk, buttermilk or whey may generally be stopped after the calf is five months of age. The best calves are raised on milk products and a good meal, but fair calves may be raised by discontinuing milk or milk products after three weeks.

If spring-dropped calves, do not expose to heat and flies, but keep in a dark, cool stall until four months of age. after which they may have a quiet paddock. If fall-dropped calves, keep in a clean, bright, comfortably warm box stall. The latter should receive a limited ration of roots (turnips or mangels), or a mixture of roots and ensilage. Salt should be regularly fed either mixed with the dry meal or with the roughage or in the shape of rock salt. The amount the best young stock. Fine clover of roughage fed depends on the age of the calf. Roots are essential to the most economical development of the best young stock. Fine clover or alfalfa hay will give the best results. Calves from two to three months of age will consume, daily, three pounds of turnips and ensilage (equal parts) and one and one-half pounds of clover hay. Calves from four to six months of age will consume, daily, 10 pounds of roots and ensilage and two pounds of hay. Calves from seven to eleven months of age wil consume 16 to 18 pounds of roots and ensilage and three pounds of hay.

Feeding of Senior Calves

Fall-born calves from 6 to 12 months of age should during their first summer be provided with a good grass paddock. During the intense heat they should be allowed out during nights only. It may often be found profitable to continue a grain ration composed of two parts of bran, two parts of oats, and one part corn. However, after the calf is six months old, if well developed, the grain ration may be made secondary to the roughage ration, providing a good quality of roughage is available. The calf should never be allowed to lose weight but always be kept gaining.

To Have Better Calves

1. Give suitable feeds—what the calf likes—and avoid over-feeding.
2. Feed regularly—make all changes gradually.
3. The light, cheerful pen in winter and the dark- cool pen in summer give best results. Both must be clean, well bedded, well ventilated, and free from draughts.
4. Feedgin gruel too hot blisters the mouth and muzzle, feeding too cold may scour the calf. Keep the temperature uniform.
5. Don't forget the regular salting and fresh drinking water.
6. Remember that variety and palatability in nourishing feeds make to ward successful feeding.
7. Destroy worms, ringworm and licce.
8. Proper quarters and clean feed will largely prevent infectious diseases.

E. S. ARCHIBALD,
Dominion Animal Husbandman.

SALT NECESSARY FOR YOUNG STOCK

There appears to be an impression abroad among many live stock farmers that young cattle, dry cows or colts on pasture do not require any salt during the summer months. Unforunately that is an erroneous idea, and although it is not held by most successful stockmen, yet there are a surprisingly large number of farmers who still adhere to that belief and practice it every year. Why they should is hard to say, but nevertheless the fact stands out that cattle and horses crave for salt unless it is given to them regularly. Possibly the idea that salt is not required by dry animals is due to the fact that on the British Isles no salt is fed to the cattle, and also because most of the experiments along scientific feeding have been carried on without it in Europe. However, although salt is not required in Britain that is no argument against its use in Canada, as the difference in the climate is responsible. The damp atmosphere of the British Isles is laden with salt because of the nearness to the ocean, and although salt is not given to the animals as in Canada, they have a continuous supply, and the very air they breathe is laden with fluid salt. In Canada that is not the case, and if the animals are to get any salt they must be handfed.

It is true that animals can and have lived through a whole summer and sometimes longer without even a taste of salt, but they were not any better off by so doing . Salt is just as great an appetizer to animals as it is to human beings and the mere fact that milch cows always decrease their flow when salt is withheld should be sufficient proof as to its value. It is just as valuable and necesary growing cattle and horses as it is for milch cows and no farmer would think of allowing his milking herd to go without salt at any time. The value of salt as a food has seldom been worked out chemically, but experiments carried on in a practical way have proven beyond doubt that salt has considerable feeding value, and that it also aids digestion, which is a decidedly important item in feeding live stock. Therefore, with these facts in view a warning is sounded to live stock farmers who have their young animals away on pasture, often where they are not seen regularly, that no matter how far away they are or how good the pasture, they should not be forced to get along without salt. It is just as tasty to them as to the human family and because they are unable to reach it themselves is no reason why they should not have it. Salting at regular intervals, say once a week or so, does not take long, and if rock salt can be had and placed in a few boxes around the pasture it is much mor convenient, as one trip per month or even less will be sufficient to keep the animals supplied. At any rate, do not neglect the young animals, as they are the future of the

Blatchford's

NOW MANUFACTURED IN CANADA

Raise more calves at less cost

Its use assures you greater profit

Blatchford's Calf Meal

The original milk substitute

Canada's farmers and dairymen may rest assured that the supreme quality which has always characterized Blatchford's Calf Meal will be zealously maintained in its manufacture in Canada. It is, always has been and will continue to be the most efficient calf meal on the market.

We invite your inquiries regarding Blatchford's Calf Meal, Blatchford's Pig Meal, Blatchford's Milk Mash and Blatchford's Egg Mash, all of which will be manufactured at our Canadian plant. Full particulars and name of nearest distributor on request.

Blatchford's Calf Meal Company of Canada, Limited

200 PELHAM AVENUE TORONTO, ONT.

Established in Leicester, England in 1800; in the United States in 1880 and in Canada in 1919.

Shorthorns

The Breed For You

Shorthorn steers hold the high-price record for a carload on the open market in Canada. They also hold the high-price record for carlots of heavy steers, yearlings and feeders on the American open markets. They are money makers.

herds and flocks, and in reality the most valuable stock around the farm, and as such are deserving of the best care possible.

THE FEEDING VALUE OF MANGELS

Since the introduction of the silo, corn has become the premier crop throughout the Dominion for the production of winter succulent forage. And justly so, for there is no crop, year in and year out, that can equal it in yield of dry matter per acre or that can compete with it on the score of cost in the production of a palatable, nutritious roughage.

Nevertheless, the growing of field roots (among which mangels occupy an important place) ought not to be neglected, even in good corn districts, since experienced stockmen recognize the value of roots in the ration. In districts in which climatic conditions are not wholly favorable to the growth of corn the importance of roots is still further emphasized.

Some of the reasons which give mangels a high value in the ration of farm stock may be enumerated as follows: They are succulent and palatable, highly digestible and appetizing and, further, they possess certain qualities of a medicinal character (probably due to their potash compound) which contribute to the maintenance of good health and thrift of the stock. They enable dry roughages (hay and straw) of an inferior quality to be utilized more completely and profitably.

It has been urged that, compared with many other forage crops, mangles in nutritive value do not rank very high. It is true that they contain only from 10 per cent, to 12 per cent. dry matter but it must be remembered that this "dry matter" is entirely digestible and consists largely of sugar, one of the most valuable of the nutrients for energy, heat and fat production.

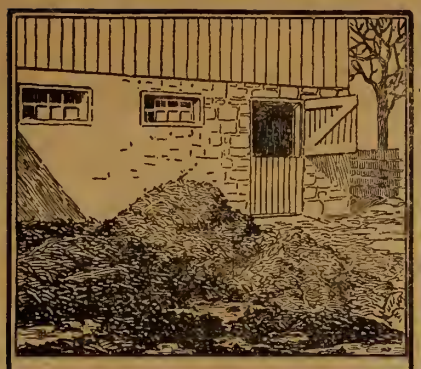
Yield, keeping qualities and ease of harvesting, are the factors usually considered by the farmer in his selection of varieties. The investigation carried on by the Division of Chemistry has shown that there is another and important factor that should not be overlooked. It has been conclusively proven that, measured by dry matter and sugar content, the several varieties offered for sale differ considerably in nutritive value. Reference to the Annual Reports of the Division will show that this difference may in certain cases amount to nearlyly 100 per cent. in feeding value.

To illustrate this fact we may compare the analysis of two well known varieties, Gate Post and Giant Yellow Globe, selected seventeen years ago to represent two wll known and distinct types of mangel. Since 1900 these two varieties have been grown side by side annually at the Central Farm, Ottawa, and analysed. Though from year to year differences in dry matter and sugar content, due to seasonal influences, have been observed the Gate Post variety has invariably and without a single exception proved the richer root. Avraging the results for the 18 seasons we obtain the following data:—

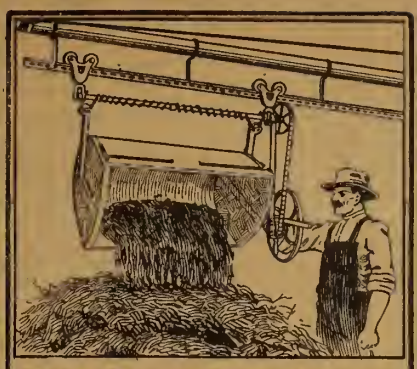
Variety	Dry Mat.	Sugar in juice	Av. Wt. in one root
Gate Post..	11.71	6.11	3 lb. 1 oz.
Giant Yellow Globe	9.56	4.62	3 lb. 1 oz.

Last seasoni in this investigation 31 varieties of mangel were analysed; the best contained 17.28 per cent, dry matter with 11.5 per cent. sugar, the poorst 8.72 per cent dry matter with 3.86 per cent. sugar. The average of all varieties was 12.64 per cent. dry matter and 6.72 per cent. sugar, results decidedly higher than usually obtained, the season being exceptionally favorable for the root crop.

For the best returns mangels require deep and rich loam. They make a large draft on the available plant food in the soil and therefore the land should be liberally manured. If the supply of manure is limited and the land is poor it will be profitable to supplement by an application of 350 to 500 pounds per acre of a well balanced fertilizer. Cultivation should be frequent and fairly deep in the early part of the season to keep down weeds and render the soil more retentive moisture. As the mangels grow late into the fall their harvesting may be deferred until there is danger of frost, and the best storage is a dry, well ventilated root-cellar, safe from frost but moderately cool. —Frank T. Shutt, Dominion Chemist.



A cow produces about $30.00 worth of manure a year. If that valuable manure is left spread all over the yard it will drain away, leach and freeze. The fertilizing value will be lost. You cannot pile it compactly with a wheelbarrow or stoneboat.



With a Manure Carrier this waste is saved. You can dump a big 800 lb. load right on the centre of the pile. The pile will be compact and solid.

Another great advantage of the BT Carrier is that you can dump it right into a wagon or spreader. Only one handling is necessary. Just fill your carrier in the barn, run out over the spreader and pull the tripping latch. You can then take the manure right off to the field.

The winter months will soon be here. The barnyard will be filled with snow drifts but the stable must be cleaned. Don't go through this winter cleaning out with a wheelbarrow. This means the drudgery of shovelling a passage through the snow when you want to get the manure away from the barn.

With a BT Manure Carrier you need not bother about the drifts. The overhead track runs away above them.
Let us send you our catalogue describing the BT Carrier. It will cost you nothing to investigate. The coupon will bring it by return mail without cost or obligation of any kind.

THE FINANCIAL REWARD FROM SHEEP

It is only within recent years that practical sheep owners have come to realize that a sense of relationship exists between feed consumed by sheep and their wool production. It is generally recognized today, however, that a well-fed sheep produces both a heavier fleece than an underfed one. When sheep are well nourished and thrifty, the wool fibre pushes out strong and full, and there is a sufficient flow of oil from the root to keep it bright and smooth. When sheep are poorly nourished, on the other hand, the wool fibre is poorly nourished also, and it is thin, weak and dull. The man, therefore, who wants to produce either much wool or good wool must keep his sheep well fed all the time. Even a flock going without water for several days in hot, dry weather has been known to cause a "break" in the staple.

The climate also affects wool. Constant wetting and drying makes it tender, the brilliancy and lustre are lost and the fibre is dry and dead, owing to the continual washing away of its usual protector, the natural oil, which coats the fibre in healthy sheep under normal conditions. The wool of sickly sheep is generally not only finer than that of healthy sheep of the same breed, but it possesses this tender quality.

Age has much effect in deteriorating the fleece. The yolk lessens in quantity after the sheep, and especially the ewe, is six years old. And, to the decrease of the yolk, there soon follows a hard, inelastic, unyielding character of the wool that renders it useless for several purposes for which the younger, and especially the wether wool, is bought, "it dies in the bowl," it sinks in the water in which it is washed, and acquires there a shriveled and dead-like appearance. It is difficult to spin and it materially injures the fabric in which it is employed.

The wool often becomes considerably injured by felting while it is on the back of the sheep. This is principally seen in the heavy breeds, especially those that are neglected and half starved. It generally begins in the winter season when the coat has been completely saturated and it increases until shearing time, unless the coat separates from the wool beneath and drops off. The cotting of wool is only an injurious extension of the process of felting. The wool forms into a hard, thick knot that can scarcely ever be unraveled. Some breeds are more subject than others to this defect.

Wool is sometimes injured by keeping it in grease for a long time. It will probably increase a little in weight for a few months, especially if kept in a damp place, but after that it will become light until a very considerable loss will be sustained. This, however, is not the worst of the case, for except when very great care is taken the moth may get into the bundle and injure and destroy the staple, and that which remains untouched by it will become considerably harsher and less pliable.

Soundness in wool is a characteristic which concerns every wool grower in every part of the world, it mattering not if it be a Lincoln or Merino staple. Wool may be good and satisfactory in quality of nice length and well put up for the market, but theer is the inevitable break and when the weakness of staple occurs it always means that the value of the clip is depreciated. When wool is tender and mushy users know that it will mean increased cost of working, hence no one will pay as much for wool lacking in strength as they will for wool that is well grown and sound.

MILK VALUES

Are we on the right track when milk value is based on amount of butter fat contained?

As butter fat varies with the same cow so may the bone, muscle, flesh and nerve qualities vary, and while milk is the one perfect food it must be milk with properly balanced values.

Unless the food given an animal is thoroughly assimilater balanced results cannot be obtained. And there is nothing on the market that has been as successful as Herbageum in securing thorough assimilation of food stuffs and consequent balanced values.

Herbageum is 25c pr lb., but would be cheap at 40c. per lb., with present values of farm produce, as one pound is sufficient for a cow or a horse or a hog for one month. For sheep and calves about one-third the quantity is required.

Herbageum is the product of the Beaver Manufacturing Co., Ltd., Galt, Ont., and was registered with the Department of Agriculture at Ottawa in May 1887, and it has an untarnished reputation during over thirty-two years.

Its regular use is economical with all farm stock and it has no equal for poultry. Advt.

The Expenditure of $610,000,000

How the last Victory Loan was spent

BEFORE buying Victory Bonds again you may want to know how Canada used the money you loaned her last year

Canada borrowed the money to carry on the war and to provide credits for Great Britain and our Allies

CONSIDERABLY more than one-half of the Victory Loan 1918 was spent on our soldiers This included $312,900,000 for paying them feeding them bringing them home, separation allowances to their dependents maintenance of medical services and vocational training schools

For Demobilization

$59,000,000 of the Victory Loan 1918 was paid on account of authorized Soldiers' gratuities

$9,000,000 was spent at Halifax for relief and reconstruction after the disaster

✦ ✦ ✦ ✦ ✦ ✦ ✦

Other disbursements were not, strictly speaking expenditures but National Re-investments

For Trade Extension

To Great Britain for example:

$173,500,000 was loaned for the purchase of our wheat and cereals.
$9,000,000 for our fish.
$30,000,000 for other Foodstuffs.
$2,900,000 for Canadian built ships
$5,500,000 to pay other British obligations in Canada.

Making in all $220,900,000 advanced to Great Britain

To our Allies we loaned $8,200,000 for the purchase of Canadian foodstuffs raw material and manufactured products

The Re-investments will be paid back to Canada in due time, with interest

These credits were absolutely necessary to secure the orders for Canada because cash purchases were impossible

They have had the effect of tremendously helping agricultural and industrial workers to tide over the depression that would have followed the Armistice, had we not made these credit loans

As far as money is concerned 1919 has been, and is still—just as much a war year as 1918. Our main expenditures for war cannot be completed until well on into 1920. Thus another Victory Loan is necessary—*Get ready to buy.*

Victory Loan 1919

"Every Dollar Spent in Canada"

Issued by Canada's Victory Loan Committee in co-operation with the Minister of Finance of the Dominion of Canada.

Back of Canada's Victory Bonds

WHEN you loan money you make sure the borrower is able to repay the loan and that he will pay you the interest regularly as it falls due.

When you loan money to Canada you know your money is absolutely safe.

Back of Canada's Victory Bonds is the entire wealth that Canada possesses—all her industries and all her resources in minerals, fisheries, forests and lands.

Canada has one-third of the area of the whole British Empire; she is larger than thirty United Kingdoms; twice the size of India; eighteen times as large as France. She is practically as large as all of the European countries put together.

Canada is larger than the United States including Alaska (Canada, 3,729,665 square miles; United States and Alaska, 3,617,673 square miles).

Canada has over 440,000,000 acres of farm lands—and only one-eighth of it is yet under cultivation.

Canada has the most extensive and best stocked fisheries in the world—232,000 square miles of fishing waters.

Canada has over 225,000,000 acres of commercial timber—she is the great forest resource of the Empire.

Canada's mineral deposits have scarcely been scratched—yet her mines yielded $210,204,970 last year.

Canada's field crops have doubled in five years—from $552,771,500 to $1,367,909,970.

Canada's people have increased their cash balances in Banks and Post Offices nearly seventy per cent. In five years—from $1,086,013,704 to $1,740,462,509.

Canada's trade has more than doubled in five years—from $1,085,175,572 to $2,564,462,215. Canada emerges from the war one of the world's greatest and strongest nations—her natural wealth equals $2,000 for each man, woman and child of her population.

Canada's Victory Bonds are the finest possible investment where safety is the chief consideration.

Moreover, when you loan your money to Canada you know that the interest will be paid every six months—all you have to do is to go to the nearest Bank and get it.

Canadians will soon be given another opportunity to buy Victory Bonds. This will probably be the last time you will be able to purchase Canada's bonds on such favorable terms.

Prepare to buy—All Canada is Your Security.

Victory Loan 1919

THE HORSE

ABORTION IN MARES AND JOINT-ILL IN FOALS ARE HORSE BREEDER'S SCOURGES

Abortion and joint ill are the two diseases that are conducive to greater losses in horse breeding circles, than perhaps all other causes put together. Unfortunately they are diseases that cannot be treated with any surety of success. It is easier to prevent disease than to treat it, and if this is true of all diseases, it is doubly true with abortion in the mare, or joint ill with the foal. The whole trend of live stock management with the best stockmen is now towards preventative measures rather than curative ones.

The Causes of Abortion

Abortion is, strictly speaking, the expulsion of the foetus at any period from the time of impregnation until the foal can survive out of the womb. If the foal is advanced enough to live, it is premature parturition. This may occur in the mare as early as the tenth month of pregnancy and the foal live. The mare may abort from any cause that disturbs the system, as for instance inflammation of the internal organs, profuse diarrhoea whether occurring from the reckless use of purgatives, the consumption of irritants in food, or a simple indigestion with gas formation in the intestines. Irritating drugs, which many horsemen give to horses in any indiscriminating manner, are dangerous to their general health, but are more so to the pregnant mare. They act quickly on the genguative systems, in just the same way as ergot of rye, and the injurious fungi or moulds found on fodder, especially in the springtime in badly ventilated barns. Frosted feeds are an additional cause, and the temptation to give mares an early bite of grass is often followed by a case of abortion.

The Symptoms of Abortion

All the symptoms of abortion in a mare vary, each depending upon the stage of pregnancy. In the first month or two of pregnancy, the mare may miscarry without observing symptoms. If the occurrence is somewhat later in the gestation period, the mare will give evidence of it by neighing and general nervous excitement, and the body of the foetus when expelled being small, is not very often seen at this stage. Abortion during the later stages of pregnancy is attended with greater constitutional disturbances, the process resembling normal parturition.

In any general illness in a pregnant mare, the closest examination should be made regarding any mucus discharge, and the filling of the udder. In some cases of abortion observed by the writer, milk was seen to drip from the udder some hours previous to the parturition, but these cases happened during the latter months of the gestation period. In the earlier stages where the symptoms are not so easily detected, and where any suspicion that something is amiss with a pregnant mare, she should be separated from all othe ranimals and placed in a quiet dark place. This is about all that one can do to stave off the disease other than calling in a veterinary.

Inquiry as to its Cause

Contagious abortion in the mare has never assumed the serious proportions in Britain which it has done in Canada and the States. Some years ago as many as 75 per cent. of the mares in some of the states, aborted. This disease still leaves considerable room for inquiry; very little systematic inqiury into its nature and cause has been carried out. It appears to be quite clear, however, that the bacillus which is responsible for abortion in cows is not even a common cause of naturally contracted abortion in the mare, although, under experimental conditions, the injection of the bovine bacillus into pregnant mares will cause them to cast their foals.

Joint Ill a Common Disease of the Foal

The most common disease of the foal is joint-ill. The reverse conditions hold with this disease, it being more rampant in Britain than in Canada, but there is a large mortality among foals in this country due to joint ill. The disease is due to an infection which occurs at birth, the navel coming in contact with infected soil or bedding, causing a diseased condition of the umbilical vessel, followed by pus infection. The symptoms are manifested by loss of appetite and fever. From start to finish the patient is listless and gaunt. In the more advanced stage, the first noticeable symptom is that of lameness, with swelling of one or more joints. Where only one joint is affected, it shows perhaps only symptoms of injury. The swollen navel cord, will in most cases unveil the true identity of the trouble. The patient lies down most of the time and is unable to bear weight on the affected leg. Pus formation takes place in the joints followed by death. The disease occurs in many cases of leaky navel, where the duct from the bladder fails to close at birth. The duration of the disease is from several days to several weeks.

The Preventative Measures

Mares bred so that they can foal on clean grass pastures where there is plenty of sunlight have little trouble of this kind. Germs of joint ill, like those of all other diseases, are destroyed by the direct rays of the sun; they grow best in shady, and filthy places. Hence, owners and caretakers, should provide open air and sunshine to prevent the disease. Mares that are bred to foal early in spring or in the fall, should be put up in stalls previously cleaned and disinfected. This disease diminishes with sanitary stables and barns. Any colts that survive have enlarged joints and are stunted in growth and continue to be sickly.

Inquiry into the cause of the spread of this disease is now undergoing an organized campaign in Britain by the Clydesdale Horse Breeders Association there, and the coming report of their investigations, covering three years work, will be an interesting contribution to the welfare of the farm horse.

WHAT CAN A TRACTOR PULL?

By V. L. Meagher

It is an undoubted fact that horse farmers do not overload. I am speaking of course of fair to good farmers which are the only ones that any conclusion can be drawn from. When a horse is overloaded his heaving and panting is very soon noticed by his driver who puts another horse on his plow or else does not pull it so deep, not because he wants to drive one more horse or because he wants to plow shallower, but because he knows that if he continues overloading his horses they will very soon fall in their tracks. Observe the same man when he buys a tractor.

He has some hazy idea in the back of his head that because the tractor is made of steel and iron there is no limit to its strength and endurance. The principal reason for this idea is that the average farmer takes it for granted that a tractor giving 10 h.p. on the drawbar will pull the same load without overloading as 10 good Clydesdales. This is not so for the following reason:

1 mechanical H.P. = 33,000 ft. lb. per min. An average horse exerts a pull of 200 lbs. walking at 2 miles per hour.

200 lbs. X 10560 ft. (2 miles) = 2,112,000 ft. lbs. in 1 hour.

2,112,000 ÷ 60 = 34,200 ft. lbs. in 1 min.

Therefore a horse pulling 200 lbs. is developing 3.63% more power than 1 mechanical H.P. Therefore 10 horses would develop each pulling 200 lbs., 36.3% more power than a tractor with 10 H.P. on the drawbar.

Suppose you are plowing wheat stubble with 14-in. plows 6 inches deep with an average resistance of 5 lbs. per square inch.

This gives a pull for one plow of 14 × 6 = 84 square inches cross section. Average resistance = 84 × 5 = 420 lbs. per plow. Two plows would pull 420 × 2 = 840 lbs. One horse exerts 200 lbs. a little over one H.P. If he only exerted 188 lbs. he would pull exactly one H.P. 840 ÷ 188 = practically 4½ H.P. Thus we find that it takes over 4 mechanical H.P. to pull two 14-inch bottoms 6 inches deep on level ground. If, however, the bottoms strike a root or a stretch of hard pan the resistance goes up to 1200-1500 lbs. or 8 H.P. A horse can pull up to 5 H.P. for short periods. It is this that enables it to get through the tough places. You can readily see that a tractor must have the same reserve power.

If 4½ H.P. will pull the load you must have another 4½ H.P. in reserve to pull you through the bad places. Farmers would be inclined to think that this extra 4½ H.P. would be a large fuel consumer and only delivering power a few times a day. This is not so. All good tractors nowadays are throttle governed. Throttle governed engines only use fuel in proportion to the load, therefore a 10 H.P. tractor with a 5 H.P. load uses about the same amount of fuel as a 5 H.P. tractor under the same load. It is easy to see from the foregoing that the common practice of pulling 3 plows with a 2 plow tractor is a foolish policy. The farmer who does this gains very little in extra work done because his engine does not hold its rated speed and he also lays up for himself numerous mechanical troubles.

Another very common practice on the part of tractor owners, is, when they hit a bad spot, to disengage their clutch, let their engine speed up, then re-engage their clutch and let the momentum of the flywheels carry them through. This is a very bad proceeding as the enormous power of the flywheels throws a far greater strain on the driving mechanism than it was ever built to stand.

Something gives way sooner or later, generally sooner.

Farmers must always consider that a tractor is designed to do heavy work to the limit of its rated power all the time. It has very little reserve power to pull itself out of bad spots. When a manufacturer sends out his tractor he expects it will receive proper consideration as regards the loads it will pull. If you overload persistently you have absolutely no cause for complaint if you find that you only get half the service from your tractor that you would have got if you had treated it right.

DISEASE AND ILL-HEALTH OF HORSES CAUSED BY "OUT OF CONDITION" BARNS

When a horse is out of condition the first duty of the horseman is to find out the cause. Without a full knowledge of the conditions that give rise to sickness among horses, no successful attempt can be made at a cure. The general conclusion, with the average farmer, is that medicines and condition powders are the cure-all for any disease, but these are of no use while the surroundings and conditions exist that give rise to the trouble. Besides the nature and practices adopted in feeding, there are a number of conditions in the barn, and on the farm, that affect the general health of the horse. It is only when these are set in a manner to convey some more of nature's way in fitting surroundings

They All Need Pratts
TO keep their energy at top-notch all the year round your horses, cows and hogs all need
Pratts Animal Regulator
Prevents disease and cures most common ailments. Puts new life and vigor into run-down animals. Keeps your horses in fine fettle. Makes your cows stay on the job all year, giving more milk and putting on firm, healthy flesh. Hogs develop quickly into big profit-payers.
MONEY BACK IF NOT SATISFIED.
In packages, also 25-lb. pails and 100-lb. bags, at your dealer's. Booklet FREE.

to the life of the horse, that healthy and cheap motive power can be had on the farm.

The "Out of Condition" Barn

In many barns there is a great neglect of proper ventilation. The air in the stalls in the morning is close, hot and foul. Consequently, the animals easily take colds, sore throats, and recover slowly. Fresh and pure air is one of the greatest safeguards to the health of lower animals, as of man, and often attention to this alone will do away with the need of tonics and condition powders.

In this connection it may not be considered a digression to make reference to the fact that the spread of tuberculosis among cattle is largely due to the general barn conditions on Canadian farms. There can be no healthy life where the air in the inside of a building is not as pure as the sunlit air of the field. Influenza amongst horses, and the consequent complications that this prevalent disease sets up, is almost entirely due to poorly ventilated barns. It is safe to say that the poorly ventilated barn where horses are confined is the root of most of the ills amongst horses, and the most approved skill of the veterinarian will fail utterly, if the principles of hygiene and sanitation are neglected.

Disinfectants are a good medium for keeping down disease, but without proper ventilation, disinfectants will fail to keep the stable free from the ravages of disease.

First have good ventilation and plenty opportunity for the sunlight to get in and around every angle of the interior. A sunbath is superior to any disinfectant that can be applied. Ventilation by open doors and windows, however, should not be practised, as there is danger, especially at night of cold air striking the animal, and chilling it to a dangerous degree.

Disinfectants to Use

Disinfection, in whatever class of stable or barn a farmer may have, should never be neglected. The walls should be frequently white washed, and the discharges from a sick animal should be deodorized by the use of sulphate of iron (copperas) which is a cheap and efficient agent for the purpose. A handful may be dissolved in a bucket of water and thrown into the drain or stable gutter. Permanganate of potash is also a good disisfectant for this purpose, and a few crystals dissolved in a bucket of water will prove equally as effective.

In contagious cases it is of the first importance that the infecting germs be destroyed as soon as they are produced and before they have had a chance to spread the contagion. The attendants on such cases should not handle or approach healthy animals, when it is possible to avoid it.

Carbolic acid in its impure liquid form can conveniently be applied with a brush over the doors, walls and mangers. Rugs or blankets may be wet with a weak solution of it and hung around, to attract and destroy any disease germs floating in the atmosphere. It has also the advantage of being disagreeable to flies, which in summer time are sure to attack and annoy a sick animal, and are a ready medium in the spread of many diseases.

The value of disinfection is now readily recognized. It has been proved beyond controversy that over and over again malignant maladies have been stayed in their ravages and have been prevented from extending by a free, constant, wise use of potent agests.

A useful preparation, that will keep the atmosphere of the stable free from germs is made as follows: Common salt, two lbs.; oil of vitriol, one pint. Pour the oil of vitriol slowly in the salt, and muriatic gas will be evolved, which is a powerful disinfectant. Be careful in handling the oil of vitriol as it will burn the hands or clothes if it comes in contact with them. Use an old metal pot or pan, and have a cover for it, so that it can be covered up when enough of the gas has permeated the atmosphere in the barn, which can be gauged largely by the smarting effect in the nose when inhaled. It will keep the ies away and the atmosphere pure.

HORSE AILMENTS

PEERLESS PERFECTION
The Fence
For Real Protection
gives life time service. Is made of the best Open Hearth steel fence wire, all impurities burned out, all the strength and toughness left in. Makes the fence elastic and springy. Will not snap or break under sudden shocks or quick atmospheric changes. Galvanized to prevent rust and the coating will not flake, peel or chip off. Can be erected over the most hilly and uneven ground, without buckling, snapping or kinking. Every joint is locked together with the well-known "Peerless Lock." The heavy stay wires we use prevent sagging and require only about half as many posts as other fences.
Send for catalog. It also describes our farm gates, poultry fencing and ornamental fencing. Agents nearly everywhere. Agents wanted in unassigned territory.

GREASE HEEL IN GRAPY STAGE

I have a mare which has grease heel in its grape ystage. The leg is covered with bunches from the size of a bean to that of a walnut. There is not much swelling at present. I have been using the following once a day: 1 quart spirits of turpentine, 2 ounces of corrosive sublimate, and 2 ounces of camphor gum. I also am putting on once a day vaseline and burnt alum. The fungoid growths extend from the hoof up one-third of the way to the hock. They do not bleed as easily as they did, but there is still an offensive odor.—J.A.C.

Reply.—The measures you are adopting are not drastic enough to remove the grapes form your mare's legs. After cleansing and drying the skin the "grapes" should b removed by means of a thermo-cautery. If they are numerous do this wok at several operations; do not remove all at one time, as the treatment would be too severe. The old-fashioned method of removing such grapes was to wet a littl eshovel such as the blacksmith uses for his forge fire, lay it upon the sound skin with one edge close to a grape, then cut off the grape by means of the edge of another shovel of the same kind made a cherry red hot. The wet shovel protects the sound skin from burning. Dissolve one can of concentrated lye in two quarts of soft water and cork tightly. Mix 2 ounces of this in a small bucketful of soft water and twice daily thoroughly bathe the affected leg. Gradually make the bathing solution stronger, if that proves necesary. Let the mare live on grass, hay, fodder, roots and bran, without grain. Night and morning give her a tablespoonful of Fowler's solution of arsenic for a week, then increase to three such doses a day. Gradually discontinue the medicine when no longer needed, taking at least ten days to the process.

The mare should be well exercised daily or left to run on the pasture.

Those whose ambition leads toward becoming a master breeder should study his lessons well. If he but consider wisely the methods that have brought success to breeders of years gone by he will find sign-boards aplenty pointing the way he should advance.

A Halter Guaranteed Unbreakable

You can soon discourage the toughest puller you'll ever have in your stable, when you tie him with a Griffith Broncho Buster. It's one of the strongest halters made—guaranteed to hold any horse for a full year from date of purchase.

Griffith Guaranteed Halters

Look for the Griffith Guarantee tag before buying a halter. The Broncho Buster was designed specially for the Western farmers, to hold those mean, wiry bronchos—and it does hold them. If you have a horse that can break or pull out of a Broncho Buster within a year from the time you buy it, we'll send you another free.

Broncho Busters are sold by dealers at $2.75 (in the West $3.00). If your dealer can't supply you, send direct to us, giving dealer's name.

Get our Halter Book. There's a halter in it for the wildest horse in your stable and for the gentlest. Your dealer will give you a copy or drop us a card.

POULTRY.

MORE EGGS IN WINTER MONTHS

Among the little odd jobs waiting to be done on the average farm along in the fall of the year is that of fixing up the hen house. Poultry do not like wet feet so it is well to see that the floors will be well above high water mark and clean and dry for the winter. The hens do not like draughts of cold air with sleet or snow beating in upon them and it is a matter of profit to see that the roof and sides are ship shape in that respect. Sunlight is the great warmth and health-producing agent and it is a good plan to arrange for windows in the south to admit of all sun possible during the sunny days when snow lies deep. The average farmer is coming to believe that poultry pays well for its keep during the winter if the keep is even fair and extra well for the few little items that go to make the keep a little above the average.

It isn't always the finest equipped house that produces the better winter layers. About all we can expect of the average henhouse is that it be well ventilated at the proper spaces and dry inside with plenty of space for the size of the flock as a few hens with plenty of space is far better than many in an overly crowded area. Crowding promotes disease for the fowls do not get the necessary exercise to keep them in good condition.

It is well to have the roosting quarters and scratching sheds separated where possible, but with limited space dropping boards may be provided and the ground space under the roosts thus utilized for litter and feeding room.

Many hen houses are so situated on rather low ground or wet soil that much litter and other material is necessary at times during the winter to keep the place sanitary and dry under foot. We believe a hard clay floor is about the best flooring available for the poultry house and the cheapest even though concrete is far more lasting and easily cleaned. Concrete is cold during the winter and the hard clay filler on the present soil after being wet and tamped is not to be despised. During the slack season after threshing one may go to any fair-sized creek in the dry days and get all the gravel and clay desired for nothing but the labor involved. This bed clay and gravel of the stream makes an excellent flooring material in the stock sheds, as well, if one does not have the cement type in use.

Window glass is high and of poor quality as a rule these days and the muslin sacks that contain the various ground feeds we buy make excellent substitutes. These sacks when ripped open and stretched tightly over a sliding frame may well serve the purpose of windows. They admit of a good light and yet check the draughts effectually. We find this material does admit the air, but that cold biting edge of the wind has been eliminated as well as the sleet and snow. Fresh air is one big item with the poultry anyway and glass windows are apt to create too much heat on the warmer days. The close stuffy hen house causes a mopy, drowsy condition of the flock and plenty of fresh air, even though it be a little cold, only tends to heep the hens scratching to keep healthy and warm.

The sides of the hen house may have become badly weather checked and wide cracks have resulted perhaps through which the raw wind whistles on the stormy days. A cheap grade of tar paper over the worst places will help much. A cheaper method still of stopping these cracks is found in taking narrow strips of sacking and tacking these over the places then painting over with roof and metal paint. It is inexpensive and shuts out all draughts as well as the snow and sleet and rain. W. L. H.

THE DUST BATH FOR POULTRY

It is generally agreed that a good dusting bath is one of the best things that the poultryman can provide for the hens, especially during the winter months. It affords exercise which is greatly enjoyed and it serves to keep down lice and vermin in a way that nature intended. During the winter months, lice are especially apt to get a foothold in the laying flock because there is no opportunity for the hens to fight them in the natural way.

One of the best ways to handle this situation is to save a barrel or two of road dust in the fall and store it in the barn or a corner of the poultry house. You will then have plenty of available material for the dusting bath throughout the winter. Twelve-inch boards placed on end and under a sunny window will serve to keep the litter out of the dusting material and to make it especially inviting to the hens. Where dust or garden loam was not saved before frost made it impossible, good material may oftentimes be obtained under the floor of a warm barn or crib. If it is impossible to get any soil, ashes may be used, although they are more desirable when mixed with good dirt.

Where hens have a good dust bath throughout the winter they will be unusually contented and healthy. The presence or possibility of vermin getting a foothold in the flock is greatly lessened, all of which is reflected in greater egg yields.

Another very good plan is to make a box of whatever size desired and to place it on legs immediately under a sunny window. This absolutely prevents any litter or other rubbish getting into the dusting bath and it makes it warm and cozy throughout the day for the hens. The effectiveness of any dust bath may be greatly increased by mixing a good insect powder in it. In this way the hens will be encouraged to perform the unpleasant task of dusting themselves with it.

The dusting bath does not require a great deal of attention and it will cost only a few minutes' time, but it is one of the little things that make winter eggs possible. C. S.

POULTRY RAISING ON LARGE SCALE

Possibilities of the poultry business conducted on a big scale are receiving a thorough tryout at M. J. O'-Brien's Barrydale Farm, in Renfrew county, under the supervision of G. W. Miller. Although this enterprise is scarcely one year old, a great deal has already been accomplished and operations are in full swing. A great deal hinges upon the success or failure of the scheme as it is understood that if this first venture proves to be a success, it is the intention of the owner to establish several others like it.

The start was made in the spring of 1918, and it could hardly be called starting in a small way either as the first purchases amounted to nine thousand day-old chicks, mostly white Leghorns. These were reared by the colony house method, the houses used being of the ordinary type and about thirteen feet square.

Later in the season the question of winter laying quarters was solved by the erection of three laying houses, 160 feet by 20 feet. In order to avoid any possible trouble from dampness the laying houses were built on posts between two to three feet above ground level. The houses face south, and plenty of window space is provided at this side. Partitions at intervals of 15 feet divide up the interior of the laying houses into a series of small pens. Good ventilation has been provided for by the installation of the Shannon system; this consists of having two shutters—two feet square—in each of the pens or compartments, and these are always left open.

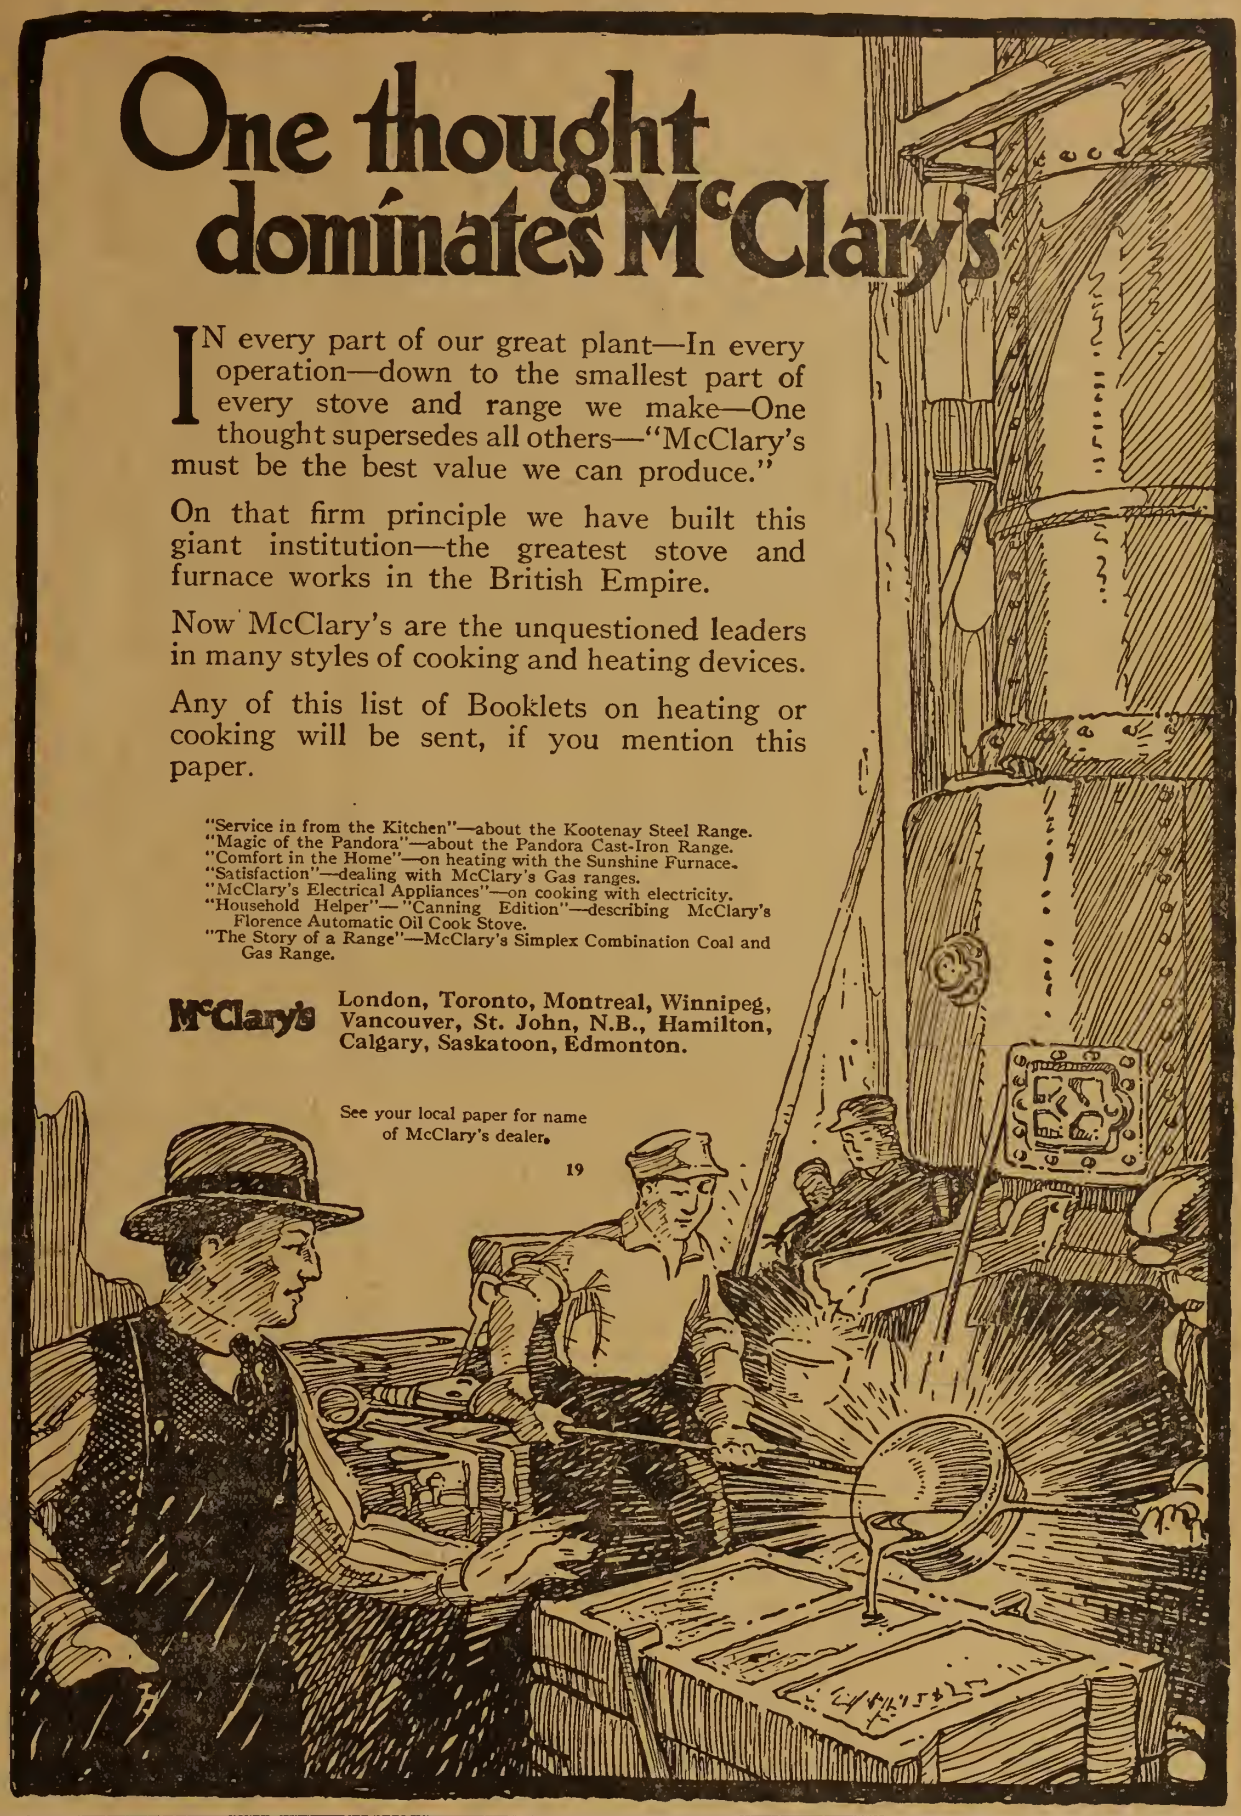
Some thirty-six hundred White Leghorn pullets were kept through the winter and very satisfactory results as to egg production were and still are being obtained. The Journal was informed that as high as two thousand eggs per day have been gathered, and at the time of writing the daily output is said to average fifteen hundred eggs daily—certainly a creditable record for the first season. Artificial light is being used to stimulate egg production.

As to the question of feeds the fowl have access at all times to water, grit, and a dry mash. Grain is fed three times a day.

The hatching is being done on the farm this year, and for this purpose a 6,000 egg size hot water incubator has been installed and judging from reports is giving good satisfaction. No pains are being spared in an effort to get hatching eggs from the very best strains, and as high as 40c each has been paid for hatching eggs of American strains of White Leghorns by the management of the Barrydale Farm.

The marketing system followed is in brief as follows: the young cockerels are turned off as broilers; a large part of the egg output is sold to private customers, while a large firm in Montreal handle the surplus.

Mr. O'Brien is a patron of the Maritime Winter Fair.



One thought dominates McClary's
IN every part of our great plant—In every operation—down to the smallest part of every stove and range we make—One thought supersedes all others—"McClary's must be the best value we can produce."
On that firm principle we have built this giant institution—the greatest stove and furnace works in the British Empire.
Now McClary's are the unquestioned leaders in many styles of cooking and heating devices.

MacLeod, Sussex, N B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

THE ISLAND OF DISILLUSION

(By Berton Braley)

"I never loved a lady yet
But what some other guy would come
And try to steal away my pet
And put my courtship on the bum,"

Merkle chanted, unhappily.

"'Smatter now-" queried Heineman, his roommate, "'nother girl? Kind of foolish to ask, because you never bust into poetry unless it is over a girl."

"Yes, it's another girl," admitted Merkle, "and the same old story of hard luck. I used to fall for the full blown rose kind of a girl; you know the sort of dame who has a bunch of fellows buzzing around her all the time, but I found I wasn't much when it come to meeting so much competition. So I made up my mind I'd go and look up some nice little kid who didn't know many people sort of pick up a modest violet, you know,—and I did, but I hadn't any more than got nicely started with her when every man in my acquaintance discovered that he was strong for violets, too. And so, I'm out in the cold, cold, world—more or less—again."

"The only thing for you to do," observed Heineman, "is to get marooned on a desert island with the lady. That might give you the chance you want."

"Huh!" snorted Merkle, "people don't get m arooned on desert islands any more. But if we did there'd be some Robinson Srusoe to pop up and cut me out, anyhow.

"I wish I lived in the cave-man days
When they wooed with a lusty vim,
When they hit the lady ovet rhe head
With a knotted hickory limb,
And dragged her off to their dusky cave
To lighten its glimmering gloam,—
I think if I lived when they wooed like that
PERHAPS I could win a home!"

Merkle accompanied this bit if immortal verse with a slow dance in which he pantomimed the style of wooing at which he believed he might be successful and brandished an umbrello over the head of the phlegmatic Heineman. He was just starting to compose another verse, when there was a knock on the door.

"Happen to have any bread and butter in the place?" asked a tall and lanky young man with a pleasant, crooked smile, as he entered in response to Heineman's "Come in."

"Sorry," replied Merkle, "but our last barrel has just run out. Will a book on the war do just as well? Sit down, Franklin."

"Presently, presently," promised Franklin, "but I gotta phone to the delicatessen store for home bread and butter. You know me, Al,, I just gotta have bread and butter, I do."

"Yes, I know," said Heineman, "time after time I've seen you come reeling out of a bakery, actually overcome with bread and butter—and with a package of hellish stuff under your arm. Ah, Franklin, can't the pleas of morality turn you from this dread habit which holds you in its tentacles. Is there no chance of saving you, no hope of exorcising this evil demon of wheat which owns you, body and soul, blood and gray matter?"

"None," grinned Franklin. "So, if you'll excuse me while I go out in the hall and phone for some, I'll be back and listen again to the story of Merkle's sad young life."

He returned in a minute or two, disposed his lank carcass on the couch, and said:

"Now Merkle, unhhappy victim of the great god Eros, spill the wail!"

"How did you know I had a wail?"

"Because you looked it. And ever since I've been rooming here I've picked you as one of the fair haired boys whose main worry in life is girls. And being as how I'm one of the best little repairers and cementers of broken hearts, and a regular 'Advice to the Lovelorn' column for young men, I'm the guy to confide in. Shoot!"

The crooked smile and the bantering but sympathetic voice were irresistible. Merkle capitulated immediately.

"All right," he said, 'here's the dope. I'm willing, anxious, even eager to be married. But every time I meet a really attractive girl she's surrounded by other men and I'm not much on competition. So this last time I met a little dame who was as nice and attractive as they make 'em, but who was not yet supplied with a bunch of cavaliers. And I intended to make it a case of Marry, but I no sooner began to take her out than my acquaintances took a fancy to her and commenced to cut in on my dates. And there I am up against the same old situation. I might have a chance if I didn't always have a battle with a mob!"

"The trouble is," Franklin commented, "that you've been sticking around in town too much until you're a monomaniac. You ought to take a vacation and go out in the woods somewhere and forget this dame—and the mob around her."

"Is that the best advice you can give?" snorted Merkle, his eyes bulging, his mouth agap.

"Now I have a friend," Franklin continued calmly, "who owns a lovely little island up in the lakes. It's forty miles or more from anywhere, but it has hunting and fishing and swimming and there's a bully bungalow and an ice box and plenty of stored things to eat, and a nice old black mammy who can't do a thing but cook. My friend usually spends the summer there with his family, but he's gone to South America this year and he has turned it over to me to use as I see fit.

"Well, I'm making up a little party to go there—and I'd like to have you join it. I can't start, myself, for a week or more, but you could go right away. And you need it. You need ozone and sunshine and blue water. The fare up to the island isn't much and the living won't cost you a cent. There'll be a nice party when you arrive and I'm sure you'l lenjoy the vacation. I'll join you after a few days."

"I hate to leave Fred," demurred Merkle.

"Heineman is welcome — later—" replied Franklin, "but just now there's room for only one man, and that's you . I'll have Heineman go up aftef you return, perhaps. How about it?"

"Why, why, I'll go," said Merkle, "if the boss will let me off."

"Who is your boss?"

"Peterson, the General Superintendent of the Acme Carbureter Co. Do you know him?'

"Slightly, as it happens," said Franklin; "you ask him if you can go in the next few days. I'm sure he'll be reasonable. I'll call hm up."

"Well, I'll ask him. But when do you want me to start?"

"The exact moment," Franklin informed him, "I shall have to communicate later. But I think it will be soon.—Hah, I hear the delicatessen boy clumping up the stairs—me for the insidious bread and butter!" He rushel out of the room.

"That's darn nice of him," said Merkle, "seeing as how we're almost strangers. Wonder why he took such a shine to me?"

"Just sympathy for all bereavement," Heineman offered. "He told me it made his heart ache to see so young, so promising and so ingenuous a man wasting away in his anguish and he believed the balmy breath of nature would aid in banishing your woe."

The launch from which Merkle had stepped on the tiny pier chugged away, leaving him alone with suitcase in his hand. He surveyed the island—so much of it as was visible. He saw a clean, white, sandy beach, a pretty cottage several hundred feet back, and he sniffed the fragrance of the pines. The breeze was cool. On the porch of the bungalow he caught the flicker of a white skirt. From the chimney came a wisp of smoke. He suddenly remembered that he was very hungry. Evidently no one intended to met him, so he walked up the path and mounted the steps of the porch.

The young lady in the deep chair rose to her feet, and Merkle dropped the suitcase with a bang, dropped his hat and ejaculated. "You!"

And the girl's exclamation was also —"You!"

It was the girl he had been worrying over.

"How in the world," he demanded, "do you come to be here?"

"How do you come to be here?" she asked, with equal fervor.

"I came at the sugestion and invitation of a man friend of mine,' he explained.

"Ond, I," elucidated, "at the invitation and sugestion of a woman friend of mine . She said there was to be a nice big party. Where is the party?"

"He said there was to be a nice little party. Where is that party?"

"It isn't here," she said.

"It didn't come with me, he returned.

"I know!" she cried, "you're the nice big party!"

"And you," he approved, "are the nice little party."

"With only the old mammy for chaperone," she twinkled, "isn't it shocking?"

"Isn't it delightful?" he corrected her. "We're sort of a Swiss Family Robinson—and dinner is ready," as the black mammy appeared in the doorway.

Merkle smiled happily as he considered his stupendous luck—for he thought it was just luck. Here was the fulfilment of his dreams, his desert island and the girl his to monopolize for a day or so, anyway, until the others came. He beamed at her across the table, and thought how wonderful it would be to sit at the

IS YOUR HEART WEAK?

TEST IT OUT.

The way to find out if your heart is weak is to put your finger on your pulse. The average heart of the average man or woman should beat 70 times to the minute. If it beats much below or above this average there is something wrong. There may be palpitation, shooting pains through the heart, sleeplessness, shortness of breath, faint and dizzy spells, waking up in the night as if smothering, a feeling of oppression, the feet and hands become clammy and cold, a bluish tinge appears about the lips, the blood rushes to the head, or there is a sensation of "pins and needles". If any of these symptoms arise take Milburn's Heart and Nerve Pills, and you will find they will fix up the weak heart in no time. They do this by regulating the heart's action and invigorating the nerves.

Milburn's Heart and Nerve Pills are 50c. a box at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

opposite side of the table from her for all the rest of the meals of his life.

That evening they canoed about the shore together and she sang him sweet old songs in a soft throaty voice and when he bade her goodnight and returned to his own big, roomy chamber with its cool, comfortable bed, he fell asleep thinking of that desirable time when he could have a little flat—and Her to be the divinity on his wondrous little desert island amid the city's whirl.

Breakfast was a marvelous meal, for the girl looked ineffably fresh and sweet and radiant from her early dip in the lake, and Merkle vowed aloud that he would get up the next morning and go in with her himself.

All morning they strolled about together, and shied pebbles into the water, and in the afternoon they went swimming again, and in the evening they canoed once more—a pair in Arcady, for the night birds sang, the wind barely rustled the leaves of the trees, the water gurgled about the bows, and the moonlight spread its silver magi cover the waters and all was romance—though Merkle yawned once or twice and there were periods when the dead silence lay heavy and cold over their companionship.

Of course, it was sheer imagination, Merkle thought and a girl couldn't always appear at her best, but when they came in from their swim the following morning, her hair seemed not quite so pretty as it had always looked before, and even after she had changed from her wet bathng suit to a charming lacy dress, something of her allure was gone. He found that his eyes kept returning to a tiny mole on her chin, and viewing it with vague distaste. It had seemed rather a beauty spot until now, but it began to assume the proportions of a disfigurement. Also he wished she wouldn't play with the pendant to her necklace so much. It made him nervous. And pink ribbons in a girl's hair irritated him. Why would she wear them?

Mammy's meals were masterpieces however, and, after a good breakfast he decided that he had merely had a grouch, for the girl did look attractive and it was with a return of his old enthusiasm that he suggested she go hunting with him.

"This is a private preserve, you know," he explained, "and we can hunt all we choose. Or at least it ought to be a preserve, and I'm going to take the risk of shooting a bit.'

After several hours he decided that a woman was his idea of nobody to take on a hunt. She hindered a man, she made noises at inopportune times, she had to be helped over things, she got in the way, and she made a most ridiculous fuss over anything you killed. They came back from the hunt much sooner than Murkle had planned, and for the rest of the day Merkle took the canoe and paddled miles out into the lake, while the girl wrote letters—or that was the duty she pleaded in refusing to go boating with him that day.

Dinner was rather a trial, because neither of them seemed to have anything to say, and after a dismal attempt to play cribbage they both pleaded guilty to sleepiness and went to their roms at nine o'clock where they both heaved deep sighs of relief, turned up their lamps and read far into the night.

Merkle got up earlier the next morning, nevertheless, for he wanted to take his swim alone. Miss Ellis had, however made the same decision so of course they met on the beach. Their swim did not last long, and breakfast, this time, was a direful bore. Only courtesy kept Merkle from reading a two weeks' old paper he had found in the living room.

Miss Ellisc escaped to the kitchen and hung about Mammy all the morning and Merkle went fishing. He stayed until diner time and on his return, when he caught a glimpse of Miss Ellis in the big porch chair, no glad glow lighted his eyes.

"Oh, Lord!' he groaned, "I've got to eat with her again!"

Miss Ellis saw him coming up the path and sighed deeply.

"Heavens," she sighed to herself, "but I wish somebody else would come to this place."

But it was nearly a week before anyone else came. And when the launch hove in view Miss Ellis and Merkle were on the pier together to welcome it. They scarcely spoke to each other. And when Franklin and Miss Carruth stepped off that launch Miss Ellis embraced Miss Carruth with immense fervor and shook Franklin's hand with tremendous eagerness, while Merkle almost fell on Franklin's neck in his relief at the sight of his host.

"Well," Franklin asked, "'how do you like my little island?"

"Your island?" queried Merkle.

"Oh , yes, it's mine,' Franklin said. "That stuff about my friend's island was a bit of fiction.

"Your island is fine," Merkle answered, "but you don't know how glad I am to see you. We too people have been simply bored to extinction alone here with each other.

"Then the desert island treatment didn't really work, after all?" laughed Franklin.

Merkle, startled, stared at his host.

"Oho!' he said, "so that's the way it happened, eh? No, I'm afraid it didn't. But listen, like a friend, How about all this—how'd it happen? Who's who and what's what and why?"

Franklin extracted a piece of bread and butter from the lunch basket he had brought in the launch and took several big bites esctatically before replied. Then:

Are Looked On As Old Tried Friends

DODD'S KIDNEY PILLS HAVE EARNED THEIR POPULARITY BY THEIR CURES

Alberta Lady Who Suffered from Kidney Trouble for Ten Years is Now Recommending Dodd's Kidney Pills to Her Friends.

Tolland, Alta., Oct. 25th. (Special.—"I can recommend Dodd's Kidney Pills to anyone who needs a remedy for sick kidneys." so says Mrs. Fred Wolters, a well-known and highly respected lady living here. And Mrs. Wolters gives her reasons for making this statement.

"I suffered from kidney trouble for ten years. I felt heavy and sleepy after meals, I was always tired and nervous and I had a bitter taste in my mouth, especially in the mornings. I was often dizzy, my memory was failing and I was very irritable. Stiffness in the joints, backache, headache and finally rheumatism were added to my troubles.

"I finally decided to try Dodd's Kidney Pills and I took two boxes. I found them satisfactory in every way. I do not think they can be excelled."

You wil notice that everyone who recommends Dodd's Kidney Pills has tried them and found them good. They are recognized as old and tried friends in thousands of Canadian families. Ask your neighbors about them.

MONTREAL

DIARRHOEA COLIC AND CRAMPS.

These and many other bowel complaints such as dysentery, cholera morbus, cholera infantum, or any other looseness of the bowels, may be quickly relieved by a few doses of Dr Fowler's Extract of Wild Strawberry. It is without a doubt one of the safest and most reliable remedies in existence. It has been a household remedy for the past 74 years.

Its effects are instantaneous, and it does not leave the bowels in a constipated condition

Mr Joseph Dale, 730 10th St., Saskatoon, Sask., writes:—"Having used Dr. Fowler's Extract of Wild Strawberry for many years, I am in a position to strongly recommend it for diarrhoea, colic, and cramps. In violent cases of alkali water poisoning it has proved a remedy of superlative quality, and many a time some poor harvester or laborer has blessed me for the administration of a dose of this valuable and highly efficient remedy. I would advise every homesteader and thresherman to keep a bottle on hand."

If some unscrupulous druggist tries to talk you into taking some other preparation when you ask for "Dr Fowler's" refuse to take it, as these no-name, no-reputation substitutes may be dangerous to your health. The price of the genuine is 35c a bottle, and put up only by The T. Milburn Co., Limited, Toronto, Ont.

"You see," he said, "I'm a malefactor of great wealth and I'm always trying to play fairy godfather to somebody. It's my main amusement in life. I'm fairly successful as it, too, but ocacsionally I fall down—as in this instance . The modus operandi in your case was simple enough.

"Heineman told me who this girl you thought you wanted was. I worked through friends of mine to find friends of hers and arranged to give her a vacation on this island. I gave you the fairy tale about my friend in South America and then put you two folks up here together to give you a chance at your desert island theory. So there you are, and here you are, and 'there ain't no romance.' So the joke's on me. Miss Carruth and I came out to se how things had worked. And now we can send for Heineman and the rest of the party."

Merkle thought the dinner that evening, with four people instead of two, the most delightful meal of which he had ever partaken. It was so wonderful not to have only Miss Ellis to look at. That's too negative a way to put it; it was, rather, wonderful to have Miss Carruth to look at.

The rest of the party, four or five young men and as many young women, all tired city workers whom Franklin had come to know through his propensity to live, incognito, at various commonplace boarding houses and apartments, arived soon, and for the next week or so the island was festive. Franklin, ruminating over his eternal slice of bread and butter, presided as high priest of all high jinks. But Merkle was seldom in these assemblies. He was canoeing or hunting or swimming or cozy cornering with Miss Carruth, and he was somewhat surprised to find that though he saw her twice as often as he had seen Miss Ellis he never grew bored. Nor did she. Which gives, perhaps, an idea that Merkle, at last, was progressing.

As for Miss Ellis—there was a young lawyer in the party, a struggling young lawyer, who won this case without a struggle.

"Thanks for the time of my life," said Merkle to Franklin, when, his vacation over, he stood on the pier and bade the millionaire good-by,—"and for more than that. Miss Carruth and I. you know——"

"Yes, I know," replied Franklin. "Blesings on you, my children. Better ask Peterson for a raise when you get back, you'll find it handy to get maried on."

"By the way," puzzled Merkle, handing Miss Carruth into the launch, "I never knew Peterson to be so jolly about letting anybody go as he was with me when I started on this trip. You must have put in a strong talk."

"Yes, I spoke to him about it, Merkle," smiled the millionaire, "and he seemed willing. You see," he went on, "I own the Acme Carburetor Company. So don't forget to ask Peterson for that raise!"

He waved his piece of bread and butter in the air as the boat chugged off leaving him alone on the pier.

ORIGIN OF WOMEN'S INSTITUTES IN THE UNITED KINGDOM

Negotiations are now on to establish an alliance between the Women's Institutes of Great Britain and the Federated Women's Institutes of Canada.

Mrs. Alfred Watt, Chief Organizer of Women's Institutes in England and Wales, and Mrs. Gogman, District Organizer of Women's Institutes in England, are in Canada now and will meet with the Board of Directors of the Federated Women's Institutes of Canada early in November to conplete arrangements for this alliance. Moreover, women of New Brunswick, an opportunity will be given you at the Annual Provincial Convention of the New Brunswick Women's Institutes held in St. John during the last week of October to hear Mrs. Gogan explain the conduct of Women's Institute work in the Motherland and to catch with her a glimpse of future developments for this representative organization.

Note the following article taken from the Journal of the Board of Agriculture, London, England:—

In 1913, Mrs. Alfred Watt, M.A., Secretary of the Women's Institute Advisory Committee to the British Columbia Department of Agriculture, came to England. She spoke on Canadian Women's Institutes at different gatherings and shortly after war broke out issued a leaflet showing how the establishment of women's institutes in villages would help towards an increased food supply. In 1915, Mrs. Watt, who had for many years been connected with the Women's Institutes of British Columbia, discussed the matter with Mr. Nugent Harris, then General Secretary of the Agricultural Organization Society, and after further investigation and reports the A.O.S. at its annual meeting on 23rd June, 1915, passed the following resolution:—"That this meeting is of the opinion that the Women's Institutes movement, which is filling so important a part in the rural life of Canada, could be adapted and made equally suitable to English rural conditions, and that the body re-organize it in this country as the Agricultural Organization Society, and that it be a recommendation from this meeting to the Governors of the Society that they should be responsible for the work."

This resolution was approved by the Governors, who appointed a small sub-comittee to carry out the work.

The first districts visited by Mrs. Watt were North Wales, where the first Institute was formed at Llanfairpwll in September, 1915, and East Dorset, where the first English institute was formed at Wallisdown in November of the same year.

By December, 1916, 50 institutes were in existence and the number increased steadily. By October, 1917, there were 137 institutes in England and Wales, and the importance of the work they were doing with respect to increasing and preserving the food supply had become so evident that the Board of Agriculture, with the approval of the A.O.S. offered to assist in their formation by creating a special Women's Institute Section under the Women's Branch of the Food Production Department to undertake propaganda in close co-operation with the Women's County War Agricultural Committees. Representatives of all existing institutes were summoned to a general meeting in London, and they, (a) decided to accept the offer of the Board and to transfer to them all work in connection with the formation of new institutes; and (b) elected an Executive Committee to continue and develop the work hitherto carried on by the A.O.S., of assiting and strengthening existing institutes. The Executive consisted of Lady Debman, Assistant Director of the Women's Branch of the Food Production Department of the Board of Agriculture; representative members of various institutes; four members nominated by the A.O.S.; two members nominated by the Board of Agriculture (Women's Branch), two by the Board of Eudcation, and one by the National Union of Women's Workers—Mrs. Watt as the Chief Outside Organizer, and Mrs. Harris as Head of the W. I. Section attending ex officio.

So rapid was the growth of the institutes and so vigorous was the desire to co-operate and to break new ground, that it soon became advisable to strengthen the organization by forming federations to link together the institutes in each county and to asist in the establishment of co-operative industries. At the present time (October 1918) there are 700 institutes in England and Wales, and

18 County Federation—including the North Wales Union.

Nor has the movement been confined to England and Wales. In the spring of 1916 Mrs. Blair of Hiprigg Mains ,Gladsmuir, and Mrs. Gooch of Torcastle, Banavie (who had seen something of the working of Institutes in England) independently approached the Scottish Board of Agriculture to ask whether they would give favorable consideration to the formation of Women's Institutes. Moreover, in April, 1917 (at the suggestion of Mrs. Blair) the Scottish Council of Agriculture passed a resolution that women's institutes on the lines of those in England should be established.

A deputation to the Secretary for Scotland was favorably receeived and Mrs. Watt was invited to address public meetings organized in the North Scotland by Mrs. Gooch, and in the south by Mrs. Blair. An Advisory Committee to the Board of Agriculture for Scotland was set up, and they appointed Miss A. Campbell as Organizer for the period of two years. By August, 1918, 35 institutes had been formed, with a membership of 1,391.

In Ireland, the work done by the United Irishwomen on similar lines is bearing excellent fruit. The aim of this association, which was started in 1910, is to raise the standard of health and living, and to press into the service of their country all classes and all sects among women whose homes and interests lie outside the township areas. Such women have often felt that their talents are somewhat wasted and their opportunities of assisting in public work have been too few to be worth considering. The "United Iirishwomen" offers all women an opportunity to assist in the regeneration of their country at a time when the assistance of every man and woman is required as it has never been wanted before. "The aim of the Women's Institutes movement is precisely the same, and the two are in close touch with each other.

When it is considered that the women's institutes have come into existence at a time when everybody was already more than fully occupied with other affairs, when difficulties of transit placed almost insuperable obstacles in the way of holding meetings, and difficulties of food made a somewhat dismal solemnity of social functions, when money was so easily—and rightly—raised for war charities that it was almost impossible to raise it for anything else, and most of the women who would naturally have been the leaders or organizers of such a movement were absent from home, nursing in hospitals or driving motor ambulances in France, the rapidity of its growth and the fact of its becoming so widespread speak much both for its vitality and for its sutability. In war time we cannot do with superfluous calls upon our energy; time becomes a thing to use, not to pass, and that a large and ever-increasing number of shrewd country women choose to use it in this way shows that they find the institutes of practical value. Nor have they a value for women only; one sex cannot benefit without its reacting on the other, and the whole of rural life must necessarily be affected by such a movement. In the words of Sir Daniel Hall, Permanent Secretary to the Board of Agriculture and Fisheries, in a circular dated May 1918, addressed to the Local Education Authorities in England and Wales:—

"Of the many new enterprises in rural development which the war has stimulated, there are few, in Mr. Prothero's opinion, which are so full of promise for the future as the active association of women with agriculture and the prominent share which they have taken in the food prosecution campaign. Women's Institutes, where established, should provide a means of preserving the new spirit, as well as of extending it in fresh directions; but it is a potential stimulus to the education of the men and boys engaged in agriculture, as well as the women and girls, that Mr. Prothero thinks they particularly deserve the support and sympathy of Education Authorities."

The new spirit to which he refers is one which bids fair to set agriculture in its proper place as the true aristocrat of industry: "We may take what we please of Lillies and Lions Rampant, and Spread Eagles in Fields d'Or or d'Argent; but if Heraldty were guided by Reason, a Plough in a Field Arable would be the most Noble and Antient Armes," and these arms the promoters of the movement look to see borne in triumph by the land army of the future.

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

A MESSAGE TO WOMEN!!

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me today for free trial treatment.

Mrs. M. Summers, Box 309 Windsor, Ont.

THE FEDERATED WOMEN'S INSTITUTES OF CANADA

For some time there has been a feeling among Women's Institutes and similar organizations throughout Canada that a closer co-ordination of the work being done by these organizations in the different provinces would be both desirable and beneficial not only in the unification of the work but even of greater importonce, the unification of the people.

The idea of such a Federation having been endorsed at the different Provincial Conventions, steps were taken to bring about its inauguration.

Accordingly a conference was held in Winnipeg, Man., in February of this year, resulting in the formation of the Federated Women's Institutes of Canada.

The Federation shall include, the Women's Institutes of Canada, the Home Makers Clubs of Saskatchewan, the Home Economics Societies of Manitoba, the Homemakers Clubs and the Cercles de Fermiers of Quebec. The largest women's organizations, strictly non-partizan, non-sectarian, in Canada. The motto of this organization is "For Home and Country."

The administrative body of the Federation shall be a Board of Directors consisting of a President, Corresponding Secretary, two members from each Province, Superintendents of the Provincial Women's Institutes and Convenors of all Standing Committees.

The Executive of the Federation shall consist of a President, a First Vice-President, a Second Vice-President, a Treasurer, a Corresponding Secretary and three other members and one additional member for each Province which hereafter joins the Federation, but not more than one representative shall eb appointed from each Province.

Superintendents of Provincial Women's Institutes shall be ex officio members of the Executive, the Presidency shall alternate between Eastern and Western Canada.

There shall be a Federal Convention held every two years—this convention alternating between Eastern and Western Canada.

The First Federal Convention as mentioned in the previous issue, will be held in Toronto in November and at this Convention not only Dominion affairs will be dealt with but also the proposed alliance with the Women's Institutes of Great Britain.

New Brunswick representatives on the Board of Directors of the Federated Women's Institutes of Canada are Miss Eliza Campbell, Lower Kingsclear, York Co.; Mrs. J. W. V. Lawlor, St. John, and Miss Hazel McCain, Supervisor of New Brunswick Women' Institutes.

The Executive of the Federated Womens Institutes of Canada is as follows: President, Mrs. Arthur Murphy, Edmonton, Alta.; 1st Vice-President, Mrs. Tood, Orilla, Ont.; 2nd Vice-President, appointment from Cercles des Fermiers, Que.; Treasurer, Miss Eliza Compbell, Lower Kingsclear, N. B.; three other members, one each from Manitoba, Saskatchewan, British Columbia; Corresponding Secretary, Mrs. J. F. Price, Cal-

gary, Alta.

Provision was made for the securing of the following honorary officers: Patroness, Her Excellency the Duchess of Devonshire; Honorary Presidents, the wife of the Premier of Canada and the wife of the Leader of the Opposition; Honorary Vice-Presidents, the wives of the Lieutenant-Governors of the Provinces included in the Federation.

To facilitate and make more efficient the work of the organization certain standing committees were named. These with their convenors are as follows: Education,Mrs. George Putnam, Toronto, Ont.; Home Economics, Miss Anita Hill, MacDonald College, Que.; Public Health and Child Welfare, Dr. Margaret Patterson, Toronto, Ont.; Immigration, Mrs. Chas. Robson, Winnipeg, Man.; Legislation, Mrs. Ralph Smith, Victoria, B. C.; and Publicity, Mrs. Nellie McClung, Edmonton, Alta.

Associated with these Convenors are representatives of the Women's Institutes and similar organi-ations included in the Federation from the different provinces.

New Brunsick representatives are as follows: Education, Mrs. Chas. Comben, Woodstock; Home Economics, Mrs. Pos. Royer, Petit Rocher; Public Health and Child Welfare, Miss Katherine Stewart, Fredericton; Immigration, Mrs. H. Lawrence, St. John; Legislation, Mrs. C. J. Osman, Hillsboro; Publicity, yet to be appointed.

The establishment of a Dominion Official Organ to be entirely under the control of the Federated Women's Institutes of Canada was unanimously decided upon at the Federation Conference.

A representative of the Federated Women's Institutes of Canada, also of the Cercles des Fermiers, Que., will address the Annual Provincial Convention of New Brunswick Women's Institutes held in St. John the last week of October.

Speaking of the Federation of Women's Institutes, the Editor of a Vancouver paper says: "In the Federation of Women's Institutes there has arisen a mighty force for good whose influence knows no bounds."

The Winnipeg Free Press says: "It is too soon to adopt the role of prophet and forthwith tell what a mighty force this organization is going to wield in the affairs of the Dominion. It can only wield that force if the whole is vitalized by the interests of the Provincial Organizations.

KNOW YOUR CHILD'S TEACHER

By Rhena Anita Pugsley

When Bobby, all washed and combed and nicely dressed, goes whistling off to school in the morning, do you ever give a thought to his going, beyond the thankful one: "Well, I know where he is for the next five hours?" Do you ever wish that you could know his teacher and hear more about his school life? Sometimes you do—and then you wonder how it can be accomplished.

Do mothers ever try to know the women who teach their children? Some of them do, but the majority overlook entirely the importance of this duty.

A perfunctory question or two at the opening of school, about how Bobby likes his teacher asd what he is studying now, is as far as many parents ever get. All too often the teacher is weighed in the balance and found wanting in some such way as this:

"Why were you late home from school to-day, Robert?" "Aw—the teacher kept me in." "Well, what did you do?" "Didn't do a thing. She's always picking on me; she don't like me, anyhow."

A little later, when Bobby produces a report card bearing three C's and two D's, the mother is convinced that the teacher probably does "Pick on" her boy. And Bobby's failure to be promoted at the middle of the year clinches this conclusion beyond all question.

But undoubtedly you belong among the more conscientious mothers. So you spur yourself to the effort of visiting the school some monring, while your Bobby writhes in his seat, shamefacedly conspicuous before the other boys. Possibly he is called forward and put through his paces, at which you beam your delight if he happens to acquit himself with credit. A handshake and the exchange of a few polite expressions end the interview, and you go home with a complacent feeling that you have "shown a great interest. Thank goodness, it's done for this year!"

Establishing Personol Relations

The significant point is that there has been no establishment of personal relations with the teacher, and no attempt at any either then or later. On her side the teacher forces herself to

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send **FREE** to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Write for free trial treatment.

Mrs. M. Summers
BOX 309 WINDSOR, Ontario

PILES Do not suffer another day with Itching, Bleeding, or Protruding Piles. No surgical operation required. Dr. Chase's Ointment will relieve you at once and as certainly cure you. 60c. a box; all dealers, or Edmanson, Bates & Co., Limited, Toronto. Sample box free if you mention this paper and enclose 2c. stamp to pay postage.

make a few obviously "duty calls" upon the mothers of her "worst cases." After the nerve-exhausting hours in the schoolroom, she is not overanxious to spend the time of relaxation in the same atmosphere. But she goes.

Naturally on such an errand the position of parent and teacher is not lost sight of for an instant.

No matter how tactful she may be, the mother knows that the teacher has come to complain and this alone "raises a barrier between them and throws the mother on the defensive." The teacher departs with a sigh of undisguised relief and feels that she has done all that can be expected of her.

Where is the difficulty and what can mothers do to bring about a better understanding?

If you will stop to consider, you will realize how great a difference it makes from what angle your various children are approached. Remember that the teacher generally has anywhere from forty to sixty pupils. In her mind they classify themselves as bright, quick and intelligent or dull and stupid, with a further subdivision into orderly, mischievous and troublesome in various degrees.

What a help to that teacher if she could know that your Mary over there in the third seat, who seems to her exasperatingly slow, is really a shy, self-conscious child, needing a lot of encouragement to bring out the best of which she is capable. And what a benefit to Mary if that knowledge meant a special personal effort to develop her latent possibilities! The teacher is honestly trying to do her best, but she is too busy to find out such things by herself, and unless she happens to stumble upon the clue, Mary will have to get along as best she can.

Charles, on the other hand, is brimming with life and energy, always in mischief and absolutely irrepressible. What the teacher has failed to discover is that, though he can not be driven, a little coaxing will lead him almost anywhere. She has him firmly tagged as a source of annoyance which she is trying faithfully to subdue by sternness and severity.

Ask Miss Blank to come and see you

And yet all that misdirected energy might be turned to good account if only she held the key.

The practical result for Charles is that he will surely hate the teacher and he may come to hate school as well. He will get discouraged and disgusted, and the next thing you know he will be wanting to "drop out and go to work." And all because there was no point of contact between the boy's teacher and his home.

Now suppose that, at the end of your visit to our school that morning, you had said to the teacher: "Miss Blank, we have a good deal in common through that boy of mine. I want to know you better and I am going to try to." Suppose you had followed up this advance by a call, treating Miss Blank exactly as you would any other lady whose acquaintance you wished to cultivate.

Teachers neither wish nor expect to stand on ceremony, but certainly they are entitled to the civilities of ordinary social usage. Suppose that the calls are followed by an invitation to dinner or tea. The teacher is glad to accept, for she is really much interested in knowing you. Professionally she sees in it a definite opportunity, and personally it is a pleasure. So you meet in a friendly way, with no suggestion of patronage or condescension on either side. You enjoy each other's society and possibly have an opportunity for a confidential chat.

Beyond a question, the teacher by her very contact with your home will carry away a keener understanding of the proper way to help your particular child, and a more sympathetic attitude in dealing with him. He stands out from the crowd now.

What is more important, as mother and teacher you are at last working together upon your joint problem of training and development! After all is said, that is the real end to be gained. The teacher finds in you a valuable ally, who is willing to talk things iver and who can be depended on for advice and co-operation. And, rather to your surprise, you learn that you can go to the teacher with questions, suggestions and even protests, and be sure of a cordial reception.

A Real Friendship May Result

The main thing for you is to see that the acquaintance does not stop with the first visit, nor yet with the second. Once you have opened the way, there is no reason why it should not ripen into a real friendship, rich in possibilities for you both, as well as for the children in whom you are mutually interested.

No longer will the name of "teacher" mean to them only some one who has charge of them during school hours and hears their lessons and makes them behave properly if she can. Miss Blank will be a dearly loved friend and companion, associated in their minds just as much with mother and home and pleasure as with school and lessons and punishment.

No doubt the parent-teacher associations, where they exist, have helped in this direction to some extent. Nevertheless, the fact remains that here mother and teacher meet officially, and not at all as friends who have a common interest which they can further by personal contact and sympathy. Only in the home can such a relation grow up. The responsibility for bringing it about rests solely with the mother. The initiative must come from her, and it will come when she realizes the significasce of the opportunity within her grasp. She must make the effost no matter how troublesome it may seem; and, once made, she will be surprised at the greatness of her reward.

Children—of all ages—have a healthy appetite for Corn Syrup. You may safely give them all they want of

HINTS FOR MOTORISTS

by ALBERT L. CLOUGH

Editor Motor Service Bureau Review of Reviews...

EMERGENCY ELECTRICAL EXPEDIMENTS

A Temporary Substitute for the Discharged Storage Battery

Not very long ago every first class car was equipped with two distinct sources of ignition current and many were fitted with two complete and entirely separate ignition systems, one of which could be used in event of the failure of the other. Since then, ignition apparatus has so improved as to reliability, that dual and double equipments are a thing of the past and, on the whole, this change is a wise one, as the chances of failure of a modern ignition system hardly warrants the extra expenditure and complication, which an auxiliary system entails. However, there s a slight feeling of lack of security resulting from the present practice. An engine can be cranked by hand, on a pinch; a car can crawl along with an inoperative horn; it can be "put to bed with the chickens," if the lights won't work and cigars can still be ignited with matches, but the charges in the cylinders can be ignited only by the elusive "juice." It is a perfect marvel and a striking testimonial to the electrical designer, that the much abused and overworked storage battery so seldom "falls down on the job," considering that it has to do the cranking, lighting (of lamps and smokables) the horn blowing, carburetor warming and driver's hand warming. Surely "many eggs" are entrusted to this little "basket" of lead junk, and it is not strange that occasionally and occasionally only it "goes flat" under the burden of its many responsibilities. When this does occur, the first consideration is to restore ignition by supplying a source of sparking current and when this is accomplished and the engine is running, the whole trouble may be ended, for the time being. A set of good, lively dry cells, usually five in number, is what is needed and fortunately they are procurable at almost any roadside auto supply station. The cells are connected as a battery by fastening one end of a short piece of bared wire to the center connection of one and its other end to the outside connection of the next cell, continuing until all cells are hitched together. This leaves the battery with a free center (carbon) connection at one end and a free outside (zinc) connection at the other and it is these points to which the wires of the car's ignition system are to be attached. Some recommend regularly carrying a set of dry cells on a car, but this is hardly necessary as they are so readily obtainable and dry cells which have been kept for a lon gtime become "extra dry" and useless.

Every owner of an electrically equipped car should take the following precaution: He should find out exactly how to connect a battery of dry cells so that they will furnish current to the ignition system, should the storage battery fail. No general rule for this can be given, as electrical systems differ so much among themselves and the ignition switch frequently performs other functions than closing the ignition circuit. The cells are always to be so connected that the current from them can flow nowhere except through the primary circuit of the ignition coil and timer and one side of the dry battery is grounded while the other is connected to the ungrounded or live connection of the ignition devices. The wiring diagram of the particular car in question should be studied and the best method of making the connection exactly determined, in detail, as to the exact points where the dry battery connections are to be attached; what wires if any are to be disconnected; where the dry battery can be carried and whether the regular ignition switch can be utilized. At the service station of the particular system used, they can tell an owner how to make the connections, if the owner cannot figure it out, but it is not safe to depend upon the ordinary garage man to determine the method in a hurry for no human being can be expected to keep in mind the details of the numerous electrical systems in use. Almost all auto electricians very

Carhartt's Overalls

ANY man who wants to know why he ought to wear Carhartt overalls will find most convincing reasons in the garments themselves. Consider, for example, those advantages.

1. Seams double stitched.
2. Every button riveted.
3. Points where hardest strain comes doubly reinforced.
4. Aogular rule pocket.
5. Pockets roomy and convenient.
6. Give-and-take suspenders.
7. Tough, durable deoim cloth that wears like leather, and ignores washing and rubbiog.

Where else can yon get such value for your money? Frankly, I don't koow. You can be sure of getting my overalls by looking for the car-heart button.

properly depend upon diagrams of connections and, unless the diagram relating to the particular system and installation in question is available, much useless investigation is required to ascertain the correct method. A set of good, snappy dry cells will furnish ignition for many miles, if they are not needlessly exhausted by allowing the engine to stop without breaking the circuit. While the possibility is remote that the horn should fail to work, when the engine is running, dry cells will operate it and it is well to know how to connect it to the emergency source of current. Even the necessary lights can be maintained for a short period of time on the current from a dry battery, which should be a separate one from that used for ignition, but the probability of such an expediment being required is remote, the main use of emergency dry cells being to get the engine started and the generator at work.

THE CHOKER MUFFLER

Avoid the Oily Exhaust and Overrich Mixture

This defect is rare with modern cars, but if the engine is "logy" and overheats and shows greatly increased power when the muffler cut out is opened or the muffler detached, it is evidently the cause of the trouble. The motorist is usually the only one to blame for an obstructed muffler, for the clogging is due to an altogether excessive amount of oil vapor and gasoline soot having been discharged with the exhaust for a long period and this can only be the result of carelessness and neglect in the matters of carburation and lubrication—the use of inordinately rich mixtures, lack of tightness of the pistons in their cylinders and the employment of inferior oil or too much of it. If a muffler is "plugged up," power is lost because the burnt gas does not "move out" in time to allow a full charge of fresh fuel to take its place, and because the exhaust actually has to be pushed out of the cylinders by engine power. Unfortunately when muffler passages are stopped up with hard baked deposits, the only effective way of cleaning them out is to take the muffler apart, scrape the surfaces and restore passages to their normal size. Tapping the muffler shell all over with a hammer may dislodge some of the deposit and permit it to be blown out, but a perfect job cannot be done in any such easy way.

PECULIAR REAR AXLE TROUBLE

..J. D. writes: After having a new driving pinion put into my car, I took it out and before I had gone 15 miles, the car stopped, but the engine kept running. Upon investigation, I found

one axle shaft broken and the other twisted around over one-half inch. What caused this? Could the gears have been put in wrong?

Answer: We can only speculate, but it seems evident that something in the rear axle locked and that the momentum if the car, acting through the rear wheels, broke one and twisted the other axle shaft. Such a locking action might conceivably be caused by the stripping of drive gear teeth and the catching of the broken teeth in the gears, but you do not state that these gears have been damaged. If there had been any permanent locking action, the engine would not have kept on running, as you state it did and the only explanation we can offer is that the gears exerted a locking effect only long enough to cause the axle shaft injury and not long enough to stall the engine unless, of course, the transmission gears jumped out of mesh or something else let go, when the rear end trouble occurred and thus permitted the engine to keep turning over. If there was breakage of the drive gears we should sooner expect that they were defective than that there was an error in putting them in, but there is a possibility that the pinion came loose on its shaft and jammed the ring gear.

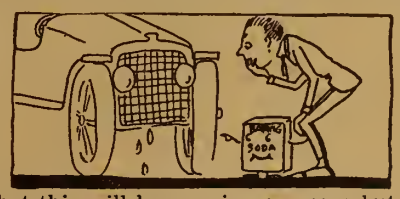
RADIATOR LEAKS AFTER CLEANING

W. S. D. writes: I cleaned out my radiator with washing soda, as I was recommended to do and several small leaks commenced, although it had been perfectly tight before. Does this mean that the soda ate through the metal and did permanent damage? What had I better do about this?

Answer: This occurrence is quite common. The soda did not harm the radiator core, but simply removed scale, which had previously closed existing defects, thus "showing them up." Very often such leaks again fill up with foreign matter contained in the watter used and it is quite likely



that this will happen in your case but, of course, the best thing to do is to have the weak spots repaired by soldering.

ENRICHING MIXTURE BY CHOKING CARBURETOR AIR

E. Q. writes: For the sake of economy, I try to run my car on as thin a mixture as possible, but I find that this reduces its hill climbing power. It is all right to keep my carburetor

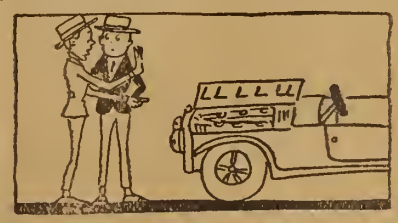
set as it is and use the "choker," when a little stronger mixture is needed, as when a hard hill is to be climbed?

Answer: There is no harm in doing this, but it can hardly give you the best results. The choker is not a sufficiently delicate means of regulating the mixture and has the disadvantage that a different degree of "choke" is required at each speed and trottle opening to produce a certain result. Very expert judgment would be required to secure the mixture proportions desired. The greatest objection, however, lies in the fact that thus choking the carburetor, while it causes enrichment, also throttles down the engine and prevents the cylinders from taking full weight charges, just at the time when maximum power is needed. Some kind of dash adjustment of the needle valve or auxiliary air is what you should have.

SPRUNG CRANK SHAFT

C. M. C. writes: After having serious bearing trouble in my engine I had a mechanic take it apart and he reports that the crank-shaft has been bent out of true. Is it practical to have this straightened?

Answer: It can often be accomplished, but it is a very "ticklish" job, requiring the services of an expert mach-



inist and a suitable screw press, with which to bend the shaft back into line again. As your shaft is no good as it is, you may as well attempt to have it straightened.

Champion

Dependable Spark Plugs

have Quality, Service, Efficiency and Satisfaction "Built-in"

You need have no hesitancy in buying Spark Plugs with "Champion" on the insulators. Every one is absolutely guaranteed.

3450 Insulators have a "built in" quality that withstands excessive temperature changes, cylinder shock and vibration to a far greater extent than our best previous insulators which gained for Champions a world-wide reputation for dependability.

There is a type of Champion to meet the exacting requirements of your motor or engine and we guarantee it to give "absolute satisfaction to the user or full repair or replacement will be made."

FARMERS

A LARGE part of the business of this Bank is transacted with farmers, and it is our desire to assist you in every way possible—whether it be the granting of credit to enable you to operate your farm more efficiently or providing a secure place for your savings. Do not hesitate to discuss your financial problems, however small, with your banker.

THE CANADIAN BANK OF COMMERCE

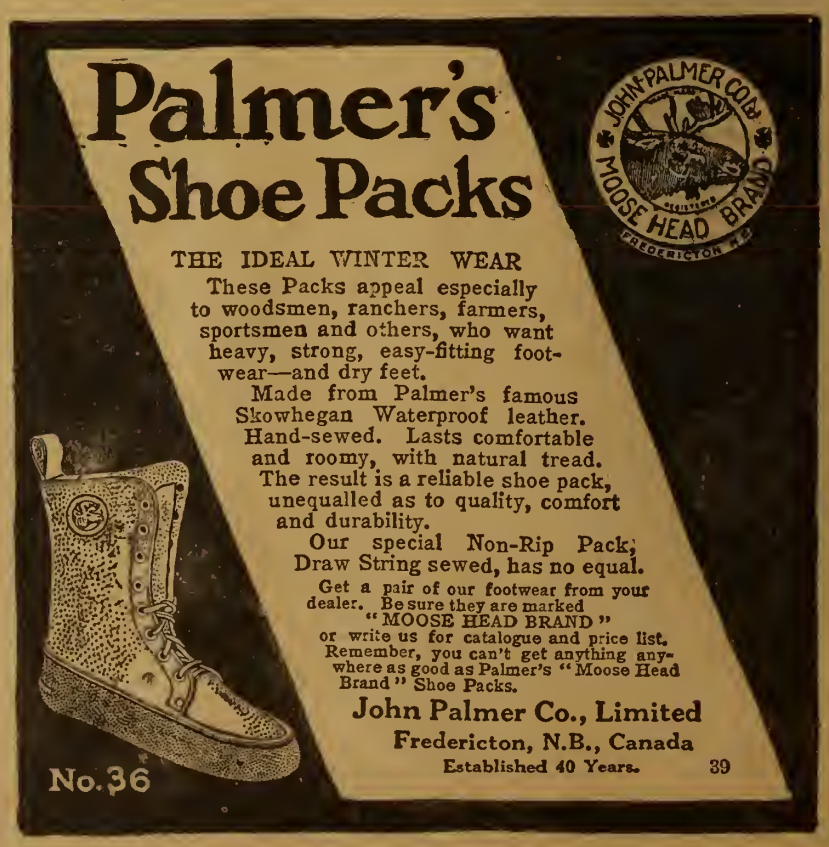
HEAD OFFICE -- TORONTO

Capital Paid Up $15,000,000 Reserve Fund $15,000,000

27A

It is the low producing, unprofitable cow that depresses the price in dairy products, and, in years gone by, has made dairy products relatively cheaper than other farm products. There is not only a direct loss in keeping the low producing cow but she helps to lessen the profit of the good cow by cheapening her product.

Sow no clover seed on acid soils or on a poorly prepared seed bed and expect good results. Test the soil and if acid apply lime in some form.



Palmer's
Shoe Packs
JOHN PALMER CO.
MOOSE HEAD BRAND
FREDERICTON N.B.
THE IDEAL WINTER WEAR
These Packs appeal especially to woodsmen, ranchers, farmers, sportsmen and others, who want heavy, strong, easy-fitting footwear—and dry feet.
Made from Palmer's famous Skowhegan Waterproof leather. Hand-sewed. Lasts comfortable and roomy, with natural tread. The result is a reliable shoe pack, unequalled as to quality, comfort and durability.
Our special Non-Rip Pack; Draw String sewed, has no equal.
Get a pair of our footwear from your dealer. Be sure they are marked "MOOSE HEAD BRAND" or write us for catalogue and price list. Remember, you can't get anything anywhere as good as Palmer's "Moose Head Brand" Shoe Packs.

Finishes the Job

MANY tractors that do a fair job of plowing are not suited for work on soft plowed ground and fitting the seed bed.

But plowing quickly and well done, is not the end of the Cletrac's service. Because it travels on its own track, on top of the soil, you can disc, harrow, seed, harvest with a Cletrac.

20 h.p. on the belt pulley takes care of belt work—silo-filling, sawing wood, mixing cement, chopping feed. At every season of the year you can reduce costs and increase production with a Cletrac Tank-Type Tractor.

If you want to make more money out of farming, see the Cletrac. Write for our book "Selecting Your Tractor." It's free.

I made arrangements to see what a Cletrac Tractor could do under very bad conditions. We had found it was very little use of attempting it with horses. The little caterpillar tractor arrived at the field at 10 a.m. and began operations, stopped one hour at noon for lunch and worked till 5.30. Altogether being on the land for seven and a half hours which included hitching and adjusting the plow, filling with kerosene and oil, also making detours around trees and boulders to avoid breaking the plow. It had plowed 8 acres of sod.

Yours truly,
J. H. Winters.
Manager Canadian Flax Co.

THE MARITIME WINTER FAIR

To crown this exceptionally good show year the Maritime Winter Fair returns to life at Amherst, December 15-18. The last Fair took place in 1915. Since then the buildings have been in the rands of the Militia Department. It is a pleasure to announce that they have now been returned, and in greatly improved condition, having been practically finished inside with sheathing and paper. Sufficient money has been paid by way of making good all wear and tear to enable the Fair Commission to put the whole plant in ship shape for this season's show. For the accommodation of visitors the ladies of the Amherst Hospital Aid Society are having their rooms fitted up, and will be able to cater to the public in the same satisfactory manner as in former years.

A new feature appears in this year's program—a model Dairy in daily operation, to handle the products of the cows in the Dairy competitions. The prize lists have been revised, enlarged and otherwise improved. From present indications everything points to a very successful show, with keen interest and an unusually large number of entries. It will be borne in mind, of course, that the interventing years, with their interest diverted from exhibitions, have had a tendency to reduce the number of animals kept primarily for show purposes. But if these special specimens are not so much in evidence, the great utility classes have had more attention than ever. Dairy cattle, sheep, hogs and poultry are of a higher standard in the Maritime Provinces than ever before. Prize lists and entry forms may be had from Mr. F. L. Fuller, College of Agriculture, Truro.

COLLEGE HOLSTEIN HERD STRENGTHENED

Those who have been in any way in touch with the farming activities of the N. S. Agricultural College know somethign of the magnificent Holstein herd there. They will also be interested to know that a new head for the herd has recently arrived. His name will be suggestive to any who follow the royal purple among cattle, Pontiac Keyes Raymondale. He was sired by Pontiac Korndyke Het Loo, a bull with a remarkably consistent record as a sire, and one of whose daughters recently made the world's three-year-old record for milk and butter production. She has been sold of late, by the way, for $12,500. The new College bull is therefore a half brother of this world's champion.

His dam is Trenton Keyes Hermes. She has an official recod of 24.76 lbs. of butter and 470 pounds of milk a week at two years old. An outstanding quality of the dam appears in the fact that during her last lactation period her average butter test was 4.5%, which is a very high test for a Holstein.

If Pontiac junior succeeds in transmtting to his progenuy the milk production of his ancestry, combined with the high butter fat test, he will be an invaluable acquisition to the Dairy interests of Nova Scotia. He was bred by Mr. D. Raymond, proprietor of the Queen Hotel, Montreal, on his farm at Vaudreuil, Quebec.

Old hose supporter hooks make the best of hangers for laundry-bags, slipper-bags, holders, etc. Sew one or two on each bag. The legs of old hose covered with washable material may be used for holders, and a hose-supporter hook fastened on one corner for hanging up.

Two or three tablespoons of kerosene used in the wash boiler will remove stains and help to whiten the clothes.

SUNNYSIDE STOCK FARM
Ayrshire Cattle and Chester White Swine

Present offering: one bull two years old, two aged seventeen months. Also a number of younger ones. Females any age. This herd is bred for production having the combined strain of "Jean Armour" and "White Heather"

KEEP
Holstein-Friesian Cows

1. The Holstein-Friesian is a large vigorous cow, full of energy and abounding in vitality.
2. Her physical organization and digestive capacity are such that she is able to turn to the best advantage the roughage of the farm, converting the same into merchantable products.
3. She yields large quantities of most excellent milk, fit for all uses and especially suited for shipping purposes.
4. Heredity is so firmly establisbed through ber long lineage that she is able to perpetuate herself for the production of strong, healthy calves.
5. When for any reason her usefulness in the dairy is at an end, she fattens readily and makes excellent beef.

If you can't buy a herd, buy a heifer

FRED S. BLACK & SONS,
Springvale Farm,
AMHERST, - - - N. S.

Advertise in the Farmer.

Only Healthy Hogs are a Source of Profit

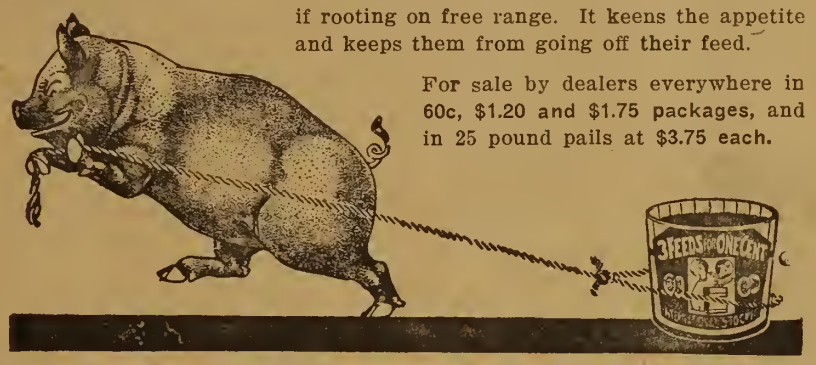
In order to get the best results from hogs by forced feeding, a reliable stock food tonic must be used—otherwise this style of feeding places an unnatural strain on the digestive organs and they become over-worked and consequently cannot perform their functions properly.

INTERNATIONAL STOCK FOOD TONIC

—has proved itself to be the ideal Stock food for keeping hogs healthy, thrifty and in rapid growing condition.

For the past thirty years it has held the confidence and endorsement of hog raisers by producing the most satisfactory results.

International Stock Food Tonic supplies to the hogs the valuable properties of roots, herbs, seeds and other things which they would obtain if rooting on free range. It keens the appetite and keeps them from going off their feed.



For sale by dealers everywhere in 60c, $1.20 and $1.75 packages, and in 25 pound pails at $3.75 each.

FOR SALE !

Several young bulls of serviceable age and youngsters. Well bred and good individuals. Prize winners at our recent show. Their dams won 1st, 2nd and 3rd in the ring of aged cows; also 1st and 2nd in the dairy test, 1st in heifer class and st in grade cow, competing against all breeds at our late show at Charlottetown. with an average fat of nearly 4 per cent. We will send photos of these young bulls and their dams to any prospective buyers. For quick sale we have priced them at from $50 to $125.

W. M. LEA,
"RIVERSIDE FARM," VICTORIA, P.E.I.

FOR SALE !

We have an exceptionally fine litter of 13 (living) of our large Berks for sale @ $12.00, four to 6 weeks old. Ready first of June.

Owing to scarcity of labor and we not being able to see eye to eye with certain Gov. officials, as to the type of Shorthorn to raise, we have decided to go out of the breeding and raising of pure bred live stock. Therefore our herd of 40 head of Shorthorns will he sold between now and fall for either breeding or for beef. Parties wishing to buy, please come and see them. We have seven very nice bulls, 10 months to two years.

THE TELEPHONE SAVES YOU

TIME

TROUBLE

MONEY

The telephone, the time saver, has never been so indispensable on the farm as to-day, when farm hands are difficult to secure and when higher prices for farm products are so general.

This human-like little instrument has completely transformed farm life. It has banished isolation and distance, and brought to the farmer a city facility—the means of direct communication.

Though it be half-a-day's journey to the village, the telephone brings you within "speaking distance" of the man you want. It enables you to transact business or make social calls at a remarkable saving of time, no matter how far away.

OUR FREE BOOK—"How The Telephone Helps The Farmer" tells all about the telephone in a most complete and concise form. Have you received your copy? If not, write your name and address on the coupon and return to us. It's FREE and without obligation—DO IT TODAY.

—AND PAYS YOU INTEREST IN THE SHAPE OF INCREASED LEISURE AND FREEDOM FROM ANXIETY

SEND THE COUPON

We supply everything a Telephone Company needs from the organization of a Company to the Complete Plant—inside apparatus and batteries as well as poles, crossarms, wire, and other line construction material and tools. Our business is the telephone business.

Wanted—

a man to represent in his home-territory and in his spare time, the world's largest cream separator manufacturer

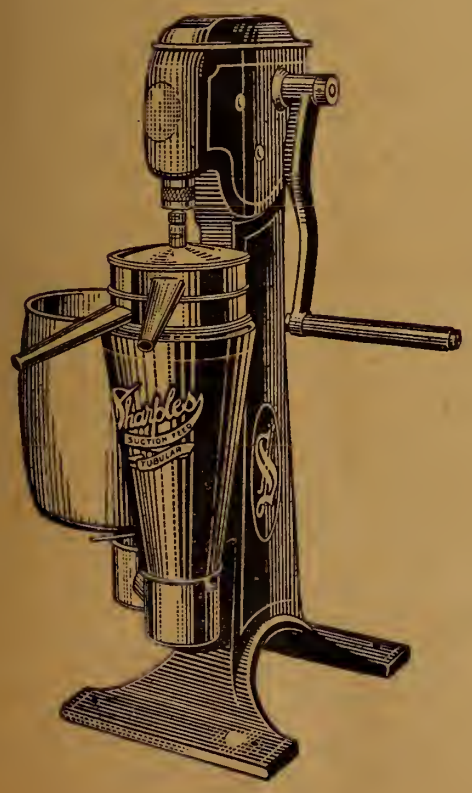
The Sharples Separator Company, the world's largest manufacturers of Cream Separators, Emulsifiers, Clarifiers, Whey Separators and Factory Separators, is about to enlarge its selling force.

The success of Sharples representatives in the territories that are now covered. insures an excellent opportunity in the new field for the right man.

The man we want is a capable successful farmer—who knows his neighbors and whose judgment is respected by them. If he is a Sharples owner so much the better.

He may devote to his work for us as much or as little of his time as he may elect. His territory will be his own.

He will find that the Sharples Suction-feed Separator has convincing and demonstrable selling points (skims clean at any speed, knee-low supply tank, no discs to wash, less than $2 a year guaranteed for oil repairs, etc.), that are not even **claimed** for any other separator.



He will find a host of Sharples users who will be glad to offer proof of Sharples' superiority in actual usage.

He will find that farmers already know of Sharples Separators through our extensive national advertising.

We want such a man in your territory. You can make this opportunity mean much to you if you will. Write today for exclusive contract and prices.

Extra Years of Close-Skimming

THE Renfrew is the only separator in which the gearing and spindles work only during the time of actual separation. The moment you stop turning the handle all wear and tear on the running parts of the Renfrew ceases. Think of what this means to the life of the machine! If you want your separator to give you extra years of service be sure that you choose the

Renfrew
CREAM SEPARATOR

On other separators the clutch is on the crank and the parts continue working while the machine runs down. In the Renfrew the clutch is on the spindle. While the Renfrew bowl runs down the running parts are *idle*.

While the parts of other separators run, say thirty minutes a day, those of the Renfrew only run twenty minutes to do the same skimming—thus saving a third of the running time.

No wonder the Renfrew keeps on skimming close for years after other machines are ready for the scrap heap! This means that the farmer who has a Renfrew does not have to replace it with a new one for at least one-third of the time after an ordinary separator is worn out.

Every extra year of service means skimming at a lower rate of cost per year.

Another feature is the Renfrew's exclusive interchangeable capacity, by which, when your herd grows in size, you do not have to buy a bigger machine—you simply get a larger bowl and spindle. Besides, it saves you lots of money.

Remember, the Renfrew is the closest of close-skimmers. It gets 99.99% of the butter-fat, while other machines often lose up to a whole pound. Will it not pay you handsomely to have the machine that will give you the most years of close-skimming?

Write to-day for illustrated literature and name of nearest Renfrew dealer.

DOMINION EDUCATIONAL BUTTER SCORING CONTEST

A representative from New Brunswick attended the Butter Graders meeting in Montreal on Oct. 22nd and 23rd when the final scores were made of the 200 odd samples of creamery butter in connection with the Education Butter scoring contest, which is being conducted under the direction of the Dairy and Cold Storage Commissioner, Ottawa. Thirty-six creameries, four from each province have taken part, each having sent in a 14 lb. box of butter monthly from May to October inclusive. These samples on arrival in Montreal are subjected to various tests, scored by three expert judges, and are re-examined each month when particular attention is paid to the flavor and keeping qualities. Each box is accompanied by a statement covering in detail the method of manufacture and noting the condition of the cream from which the butter was made . A full record of the initial and succeeding score is kept and copies thereof forwarded to all interested parties.

The object of the contest is to establish a satisfactory uniform standard for Canadian Creamery butter and to discover the method of manufacture which will produce the desired article.

From time to time butter graders and dairy instructors have been invited to attend the scoring of these samples with the result that a very wide spread and important interest has been aroused. At the meeting referred to above, representatives were present from nearly every province in Canada and were keenly interested in the examination of the samples and the accompanying reports.

The outstanding lesson learned from this conference was that many of the samples from Western Canadian Creameries were of a uniform high grade.

There were, however, sufficient exceptions to this to prove that high grade butter can be manufactured in the east as well as in the west. Some samples from N. B. had very good initial score but quickly deteriorated in quality owing largely to the quality of cream or to the lack of proper pasteurization. On the other hand the uniformly high scores from Western Canadian creameries were due very largely to an efficient system of cream and butter grading, coupled with effective pasteurization.

It is to be hoped that this contest will be continued over another season and that a scheme will be devised whereby the information resulting therefrom will be brought more directly home to the creamery men and dairymen throughout Canada.

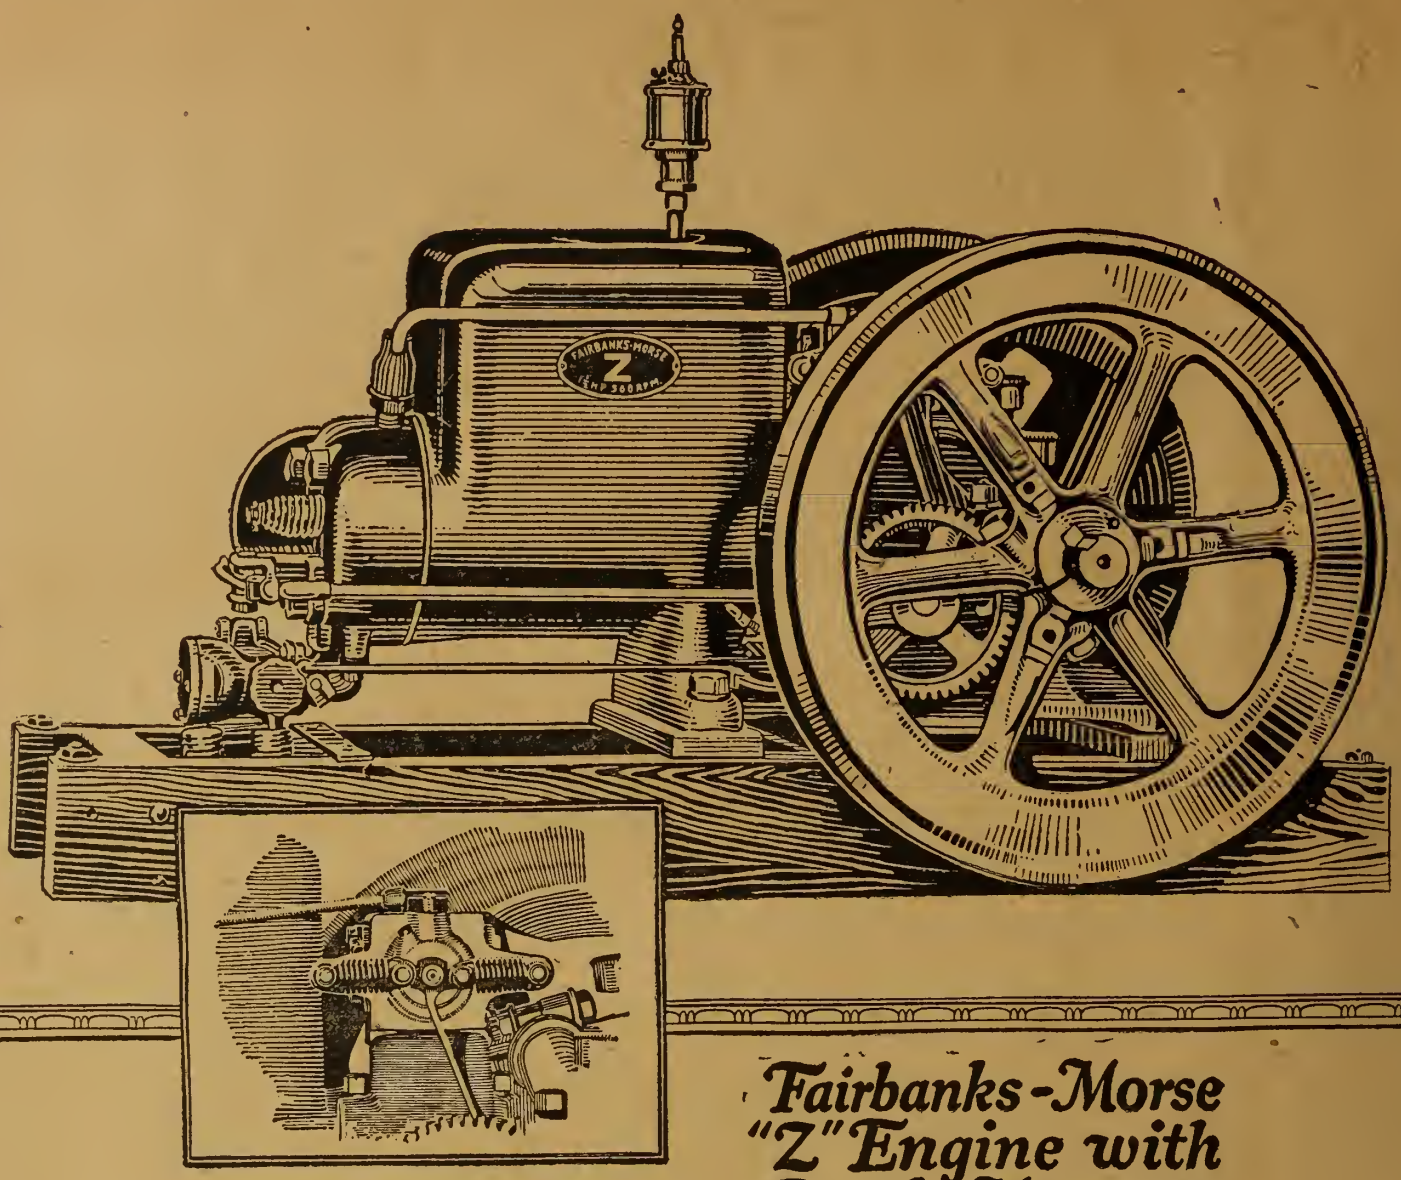
New Brunswick Creamerymen will be pleased to know that representative samples are to be selected from this contest and will be on exhibit at the Convention and Dairy Show to be held in Sussex on December 3rd and 4th, 1919. One of the official scorers will also be on hand to deal with the lessons learned from the season's work in connection with this interesting and profitable contest.

The New Brunswck Creameries entered in the contest were:

Sussex Cheese & Butter Co.
Farmers Co-operative Creamery, Moncton.
Victoria Mills.
Madawaska Creamery Co.

G. S.—I have a two-year-old heifer that freshened lately that has very little milk in the two front teats, about a teacupful in each is all I can get. Will the milk come if I continue to milk her?

Ans.—There is no better way of bringing your heifer to milk than by keeping on milking three or four times during each twenty-four hours. If this fails the only other alternative to get the most out of her is to fatten and sell her as beef . But the fact that some milk was got from them gives encouragement for you to proceed with milking, and these teats may yet develop under the manipulation.



Fairbanks-Morse "Z" Engine with Bosch Magneto

Now-There is Only *One* Farm Engine

JUST think of the famous "Z" Engine with a Bosch high-tension, oscillating magneto—which delivers a steady succession of hot, intensive sparks. ¶ Every farmer in Canada should at once call on the nearest "Z" Engine dealer and see the result of this recent epoch-making combination—FAIRBANKS-MORSE "Z" ENGINE WITH BOSCH MAGNETO. ¶ Mechanical perfection, plus power—and right price—to date sold the "Z" Engine to over 250,000 farmers. ¶ This quality and quantity production enabled us to contract for a large proportion of the extensive Bosch facilities for making this one possible "Z" betterment, which establishes a new farm engine standard. ¶ And all Bosch Service Stations throughout Canada will assist our dealers in delivering maximum engine service.

Volume 25. SUSSEX, NEW BRUNSWICK, NOVEMBER 11, 1919. Number 3.

Seventh Annual Convention of New Brunswick Women's Institutes

The Seventh Annual Convention of New Brunswick Womens Institutes opened Tuesday morning, Oct. 28th, in the Women's Institute Rooms, Union Street, St. John, N. B., and although the weather was very unfavorable, there being a steady downpour of rain, it was gratifying to note that this did not deter the ladies from turning out in large numbers, which was surely a good sign of the real interest felt by the women.

Miss Hazel McCain, Supervisor of Women's Institutes for New Brunswick, was in the chair, and the meeting opened by a violin solo beautifully rendered by Miss Lynch of St. John, after which she led the audience in the singing of "'O Canada."

Miss McCain then introduced His Worship Mayor Hayes, who in behalf of the city of St. John, extended a hearty welcome to all and congratulated the ladies on the new status they have attained, that of taking their places along side the men in looking after the affairs of the country.

Mrs. David Martin of St. Leonards replied very gracefully to the address of welcome. She said we are now in the period of unrest and discontent following the war, and we as a body of women are here to discuss the present and the future, our wish being to help in this time of need to adjust these present conditions. In union there is strength, "For Home and Country" is our motto and we offer the best we have in us.

His Honor Premier Foster was then called upon and welcomed the delegates most cordially to St. John, the Metropolitan city of the Province. Premier Foster told of his great interest in the work of the Women's Institutes and his pleasure as he noted the progress made by them. This was his first opportunity he said, to thank the women personally for the splendid way in which they had assisted in the greater production campaign during the war, their aid to the fathers and brothers and their teaching of the people the way to preserve and care for our food, added materially to the success of the Allies, and this fact of how the women assumed the duties and responsibilities in this great crisis, constituted a large factor in their receiving the franchise.

But there is a great work yet to be done. We have now the period of reconstruction and in that the institutes can help to a large extent.

Premier Foster reminded them that their organization stood for no class nor creed, and hoped that never would these questions be allowed to creep in. It is well to know the policies of the government asd read their criticisms, to know both sides of the questions, let every women acquaint herself with these matters, but never on any consideration discuss politics in the Women's Institutes. The scope of Women's Institutes in this reconstruction period may be enlarged to a considerable extent, there is need of the sympathy and aid of the women, that there may be more moderation in things throughout the country. There is also the Victory Loan to discharge our debts to the soldiers who so ably defended us, the Women's Institutes should use their influence for the success of this Loan.

Premier Foster closed his remarks with the earnest hope that the influence of Women's Institutes would spread as it is a power to promote a better community spirit which is greatly needed throughout the country.

We are sure that it was most gratifying to the members of the New Brunswick Women's Institutes to be personally assured of the sincere interest which Premier Foster undoubtedly has in the organization, and it is a regretable fact that through the tactlessness of one member the question of both politics and creed, later in the session, were carried into the discussion when they had Premier Foster's sound advice never under any circumstanses to allow these questions to creep in as Women's Institutes know no class, no creed.

Mrs. J. W. V. Lawlor, President of the St. John branch of Women's Institutes, then brought a hearty and sincere welcome from their local organization, after which she addressed a few words of welcome to the French speaking delegates of our province in their own tongue, thereby making it a more personal welcome, one which was much appreciated.

Miss McCain then read her report as Supervisor, of work done during the year. 21 new branches had been organized, making a total membership of 5,000 included in 132 branches. From 87 of these the sum of $14,341.30 had been received. Expenses during the year July, 1918-19 being $10,800.67.

Miss McCain told of the splendid work which they were able to do through united effort during the influenza epidemic of the short courses held in the towns of Woodstock, Edmunston, Fredericton, Newcastle, Bathurst and St. John, which were well attended and created much interest. Also of similar classes conducted by Miss Micaud in the French speaking districts of St. Quentin, Caraquet and Mt. Carmel, as large a number as 135 students being enrolled at some of these courses held.

Right here we might say that throughout the reports given by the delegates of the various sections of the province, the appreciation of the work done by Miss McCain's able assistants Miss Nutter, Miss Michaud and Miss Roach and others in the short courses and demonstrations conducted throughout the year, was very noticeable, hardly a report being read without an expression of sincere thanks for the untiring efforts of these capable young women.

Miss McCain referred to the address on Milk given at the Conventios of last year by Prof. Frank Hearn, and as a result of the interest awakened by that address, demonstrations were conducted during the summer months, teaching the composition and food value of milk, and that now a Bulletin on milk, prepared by the Dept., was ready for the Press, and would soon be available. Also a very comprehensive one on the preservation of food, including the canning, preserving, drying, storing, etc., of fruits and vegetables.

Miss McCain then told of the conference held in Winnipeg on February last, which resulted in the Federation of Women's Institutes, and the drawing up of the constitution. One greatly appreciated clause of that constitution being the one which provides that all provinces shall have equal representation. The first Dominion Convention to be held in Toronto early in November, Mrs. Alfred Watt and Mrs. Tyrel Godman from Great Britain, to be at that convention, and it is hoped that in the near future that this great Federation may be a National instead of Dominion one, an organization whose influence my be a power for giod hroughout the whole world.

Miss McCain's report was followed by the Roll Call and appointment of Resolution and Credential Committees, these committees being appointed by the chair.

Miss McCain read a letter from His Honor Lieutenant-Governor Pugsley, expressing regret at his inability to be present at this the opening session.

A message was then read from Her Excellency the Duchess of Devonshire, patroness of the Dominion Organization of Women's Institutes, conveying her best wishes for a successful convention. After which the meeting adjourned.

Tuesday, 2.00 p. m.

In the absence of Mrs. H. W. Reid, of Stonehaven, who was to have occupied the chair, Miss McCain again presided.

Reports of Institutes were called for in alphabetical order. These reports throughout the session, were given in a bright concise manner by the delegates, a manner that clearly demonstrated the helpfulness of Women's Institutes in developing the executive ability of her women.

These reports throughout showed a wonderful growth of a healthy community spirit, which was highly commendable, several of the Institutes working for a Community Hall, a number improving the sanitary conditions of their school houses, some improving the appearance of the cemetaries of their community, erecting fences around them, etc., two or three having purchased fire equipment for their districts, others working for their hospitals, some buying pianos for their halls, thereby making their meetings more interesting, all showing the real community welfare odne by the Women's Institutes of this province.

A tremendous amount of war work had been done during the closing months of the year, one institute alone having knit iver 1,000 pairs of socks. Many of the reports showed original and clever ways of raising money for the carrying on of their work.

After a few of the reports had been given, Mrs. J. W. V. Lawlor gave a short talk on "Flax Industry in New Brunswick." Mrs. Lawlor, in the bright, interesting manner in which she always presents her subject, told of the flax industry so well known in the Western Provinces, and showed what might be done in New Brunswick along that line as well. In the past flax was grown and used in this province, but gradually, machinery being introduced this industry was pushed out of business except in a few of the French districts, notably in the Caraquet shore, where the women still raise and spin their flax.

With the price of linen soaring there is no reason why there should not be more of this industry. The seed is provided by the Department of Agriculture, and the raising of it being attended with no great labor, being raised much as hay is raised. Mrs. Lawlor then told of the methods of raising, breaking, combing and spinning of the flax and exhibited some beautiful work made by one of the French women of the Caraquet shore, which showed what might be done by the women of New Brunswick if they were to revive this industry.

Miss Louise Anderson of St. John, accompanied by Miss Agnes Anderson, then rendered the Rosary in a most feeling manner, and received hearty applause.

Mrs. Jean Muldrew of Ottawa, who is no stranger to New Brunswick audiences, next addressed the meeting on "Rehabilitation into Civilian Life"

Mrs. Muldrew touched on the great work done during the war and paid a warm tribute to St. John for the work done for the returning men entering their port. But after the welcome what then? All are interested in bringing back conditions as they were before the war, and bettering those conditions. Trouble has already arisen by not being able to quickly enough re-establish these men and jobs for these men, is not only a national and a municipal business but an individual business as well.

Because of work we succeeded in delegating a common enemy and work must solve this present problem.

Because of War we have 10,000 widows, 17,000 fatherless children and 1,788 orphans in our Dominion, they should be cared for by the women who were protected by these men. Child

crime was prevalent during the war. The mothers must be helped with these children, or we may have our institutions filled with criminals in the years to come. As yet the G. W. V. A. are to the most extent caring for these cases, but is it fair that these men who have protected us should come back and have this added burden on their shoulders?

Mrs. Muldrew then explained the work of the Soldiers Civil Reestablishment Board and the Soldiers Settlement Board, the first aiding the disabled soldiers and second putting those desirous on the land. They had met with a splendid response in this work from the Western farmers. This problem being so closely related to the Home, a Home Branch was established with Mrs. Muldrew in charge, and she was now largely working through the various organizations, such as Women's Institutes, Daughters of the Empire, etc., making the appeal for help in the shape of warm clothing, stockings, etc., for the children and wives of these soldiers again trying to re-establish themselves.

We have so many British women with us now, here lonely and friendless, some are good, some indifferent, just as the varied collection of men that were sent over to their country, but in the most part they are a distinct asset, but need encouragement.

The unrest in Canada is largely due to idleness. We can see the glory, but we are too near the War to measure the permanent results. We have not only to heal the wounds of the war, but pay the bill also. France paid her debt to Germany in the past by the Thrift, Industry and Frugality of her women. Thrift, Industry and Frugality, these words must be held high. Waste is increasing 75 per cent since the war, this does not look like thrift. There is a great wave of laziness in Canada. It is the struggle that counts in life. The spirit "I don't want Johnnie to work as hard as his father" never does any good. All must work. And then education—education and industry are closely related. Ignorance is a liability, education an asset. To have a voice in this federation and we need more education and we must to have the franchise is opportune, but see that our educational laws are observed.

After a few more words in reference to the Soldiers Reestablishment Board, showing what is being done for the disabled soldier by the Canadian Government, and advising the Institute members to acquaint themselves with this great work and to always remember that the chastisement of our place was upon them and by their stripes we were healed. This concluded Mrs. Muldrew's address.

Miss Valde Fenton of St. John then delighted the audience with two charmingly rendered solos, after which the names of the committees on Credentials and Resolutions were read being as follows:

Credentials:

Mrs. Frank Moore, Moore's Mills;
South Tetegouche;
[illegible]ge, Upper Sackville;
Mrs. Frank Plummer, Hartland;
Mrs. David Martin, St. Leonards;
Mrs. H. Lawrence, St. John.

Resolutions

Mrs. Paul Doyle, Jacquet River;
Mrs. LeBlanc, Buctouche;
Mrs. Robert Thompson, Chance Harbor;
Mrs. Geo. Reid, Glassville;
Mrs. Jamer, Andover;
Mrs. Lawlor, St. John.

The afternoon session closed with a demonstration of the work done by the soldiers of the city hospitals under the instruction of Miss Jean Smith and Miss Eileen Keefe. Miss Smith gave an interesting explanation of the small portable looms which are used by the men. A display of beautiful work done by the soldiers was exhibited on side tables, which found many purchasers. The soldiers in charge of the demonstration were Mr. Joseph, at the loom. Mr. Young, bead work and Mr. Jeffries raffia weaving.

Meeting adjourned.

Tuesday, 8 P. M.

Meeting opened with Mrs. Chas. Comber of Woodstock in the chair. After a musical selection by the ladies orchestra, composed of the Misses Lynch and Hogen, Mrs. Comber called on Miss Helen McDougall, Supervisor of Women's Institutes of Nova Scotia, to address the meeting on "The Federated Women's Institutes of Canada."

Miss McDougall told of her recent appointment in Nova Scotia, for although a Nova Scotian she had been for some time employed by the Government of Manitoba as Supt. of Home Economics. She spoke of the growth of the Women's Institutes, how at first a handful of women would gather to discuss the homely every day questions, but how that few had grown until in a very few weeks now it would in all probability be international. She told of the object of the Federaton and of the thought and care exercised in the drawing up of the constitution and of the benefits to be derived from concentrated and united effort.

The West needs the East, the East needs the West, the spirit of adventure of the great West and the staunch steady spirit of the East, being a good combination, a solardity of women.

Miss McDougall spoke of the home building, the material, and then the spiritual and mental side pertaining to it.

Lloyd George has said: "The wealth of a nation is dependent on the health and purity of its men, women and children.

Home making is a national question, the progress and wealth of the country depend on what our homes are. We need a revision of thought in a great many lines in regard to home, it has been proved that even in our choice of food our lives are affected not only physically but morally.

Miss McDougall dwelt on the splendid spirit which prevailed at the Federation in Winnipeg, the sinking of personal opinions for the sake of the greater good. We have the franchise, now we must realize that citizenship is a duty and the responsibility should not be shirked.

Miss McDougall was listened to with great interest and by her charm of manner won the hearty approval of those present. Nova Scotit is to be congratulated on her good fortune in securing the services of Miss McDougall.

Miss Kathryn Gallivan of St. John then sang two pleasing selections, followed by two very much appreciated readings by Mrs. A. W. Wilson, St. John.

Mrs. F. T. Godman of Sussex, Eng., then addressed the meeting on Women's Institutes in Great Britain.

Mrs. Godman in a simple, pleasing manner told of the organization of Women's Institutes in England, Wales and Scotland. Mrs. Alfred Watt being the originator of this movement. She told of the difficulties met with at first, the general attitude being that it was splendid for Canada, but impossible for England. Then finally the starting of one in Amstye and again in Sussex, Eng., until now the Institutes throughout England and Wales number over 2,000, all instituted since 1914. The great difficulty at first was to find capable women for organizing but finally Mrs. Watt conceived the idea of Women Institute Training Schools, educating those who wished to take up the work. Then there was the difficulty of getting the different classes in England to mix harmoniously, teaching the poorer women "not to be chilled by the rustle of silks of their aristocratic sisters." But now the women love the Women's Institutes and schools are held in almost every County. The poorer women being of great assistance, spreading the knowledge of housecraft, which before was only practiced in their homes, reviving many industries and developing new ones, many of which were found to be successful and remunerative. A great feature was the making of dolls and toy making. They also took up basket making, banner making, gloves from the skins of rabbits, besides all kinds of beautiful needle work, including lace making, conducted economy demonstrations and by plays and entertainments kept the interest of the young.

Mrs. Godman said that Canadian Institutes had unconsciously helped the women of England, for which they are more than grateful, and said in closing that she hoped earnestly for the Federation of the Institutes of England, Canada and United States.

Greetings were then brought from the Young Women's Patriotic Association of St. John, by Miss Alice Fairweather.

Miss McCain then read a letter from Lady Tilley, conveying greetings from the Red Cross Society and thanking them for all the aid given to the Red Cross in the days of War.

She also read a communication from Miss M. Harrison, sending warm greetings and good wishes from the Canadian Club.

Miss McCain then extended an invitation to the delegates and visitors on behalf of Mrs. Foster, wife of the Premier of New Brunswick, to a luncheon to be given for their pleasure at the Manor House the next day.

Miss McCain expressed thanks to Miss McDougall and Mrs. Godman for their splendid addresses, after which Mrs. Godman invited the ladies to a closer inspection of the handicraft which she had displayed on tables, work that had all been done by the girls and women of the British Institutes, and which reflected great credit in skill and ingenuity.

Meeting adjourned.

Wednesday, 10 a. m.

Meeting opened by Miss Annie Smith, Hoyt Station. The morning being bright and clear there was a splendid attendance of delegates, also many visitors from throughout the city.

Reports of Institutes were continued from the previous day.

Report of New Brunswick Representatives of Federated Women's Institute Standing Committees.

Miss Stewart then told of the splenthe report on "Child Welfare."

She spoke of her early experience in this work in Scotland, before coming to Canada, and how much had been accomplished through perservering effort, notably the obtaining of child labor law, the inspection of dairies and farm yards, and the fixing of a higher standard for milk. The teaching of the mothers the ordinary rules of hygiene, etc., that should be observed in the home, and a better knowledge of how to take care of their babies.

Miss tSewart then told of the splendid work accomplished in Halifax and Fredericton during the influenza epidemic, and urged the need of district and school nursing, and the protection from disease and evil influence which is the right of every child. There are too many children that know more about the "movies" than they do about the use of a tooth brush. It is the duty of the state to see its children are protected and helped to become better citizens.

Mrs. Chas. Comben, Woodstock gave the report of the committee on Education. She said their policy was not outlined yet, but something definite would soon be settled on. Mrs. Comben told of the Vocational School opened this week in the town of Woodstock, where the girls of the community are to be instructed in dressmaking and millinery; this came through the efforts of the Women's Institutes. Mrs. Comben suggested many ways in which the Institutes could help the schools of the rural districts, such as installing a circulating library, and in choosing books and magazines for this library, not to forget those which would interest the boy as well as the girls. For instance, the Popular Mechanic Magazine, which is both interesting and instructive for the boys.

Then the Insttutes might develop greater taste for nature amang the young through "hikes" in the country, accompanied by some one who would be able to bring the practical side of this before them.

Also the teaching of music in the schools, should receive more attention; the Institutes could help materially along this line and also in placing a little equipment in the rural districts which would make Domestic Science possible in their schools.

Mrs. Comben went on to cite many ways in which the Institute may be of incalculable help in improving sanitary conditions of the school rooms, through school gardens, hot lunches for the younger pupils and in reference to the latter, read a letter from Mr. Putman, educational representative in Ontario, telling how the scheme was developing there and also how well it was working out in some American cities where it has been in force for some time.

Mrs. Osman of Hillsboro, then gave the report of the Committee on Legislation.

Mrs. Osman spoke of the honor confered on the women by the Legislature, an honor to them and to the men who gave it. She said it was now the duty of the women to acquaint themselves with the laws, especially those pertaining to Women's Property, Street laws and the Child Labor law, and advised that the test when any question arises on which the women should vote, would be, is it good for my neighbor or will he suffer by it, and then seeing that these laws were enforced. It is not the laws enacted that make a good country, but the observation of these laws.

Report of the Immigration Committee was given by Mrs. H. Lawrence of St. John. She told of 10,000 immigrant women passing through the port of St. John during the past year, and of the great work to be done for them, many of them being a distinct asset to the country, although there is a diversity of opinion in regard to the Immigration question, some claiming it should be suspended throughout Canada for a period of two or three years, others that no matter what present cinditions are we cannot afford to stand still. But there is work to be done and the Women's Institutes hope to be able to render much assistance along this line.

The reports from the different committees of the Federated Women's Institutes being finished, Mrs. J. W. V. Lawlor then took the chair and gave a demonstration of a Model Institute meeting. It was regretted that this had to be carried through in a hurried manner owing to the lateness of the hour.

Perhaps the most interesting address of the convention was that on "Mother's Pensions", given by Mrs. Rose Henderson, Montreal, for that appealed to all. Mrs. Henderson is a gifted speaker and held the undivided attention of her audience from start to finish as she brought forth this great need of protection for the mothers. She told of how the state separated the mother and the children, the children placed in institutions, which though good of their kind, can never give a benefit of home life so essential to the proper upbringing of the child, the mother left on her own resources, often heart broken from the separation from her children.

Mrs. Henderson very graphically told of many pathetic cases coming to her personal knowledge of widows left without any visible means of support, and the grief and despair of those mothers when obliged to give up their children to the state.

Mrs. Henderson left no doubt in the minds of her hearers as to the justice and real necessity of Mother's Pensions, besides pointing out the economic side for the state and a happier,

Gleanings from the Nova Scotia Agricultural College

ANNUAL CONVENTION OF WOMEN'S INSTITUTES

The Women's Annual Convention held at Truro in the science building of the Agricultural College, Oct. 22-23, was an exceedingly successful one. A very encouraging feature brought out in the reports was that although the Institutes were without a superintendent for the greater part of last year yet the new Suprintendnt found 80% of thm carrying on and doing excellent work.

The Convention program struck a high level at the beginning and maintained it throughout. It may seem invidious to mention names, but the key note was sounded by Mrs. E. M. Murray, of Halifax, perhaps more clearly than by any other speaker. Most of the speakers had been assigned lines of interest which were really more detailed branches of her main thesis:—The responsibility of one citizen for the well-being of another. Around this might be grouped the very interesting papers and discussions on th ecommon school, child welfare, the care of the feeble minded, the excellent course on Home Nursing and the various excursions into Home Economics in the stricter sense.

A glance over the personel of the convention indicated the high aims of this "For Home and Country" organization. The Women's Institute is attracting to itself many of the strongest and best personalities among our provincial women, as it has done elsewhere. It may not be common knowledge that two Canadian women, Mrs. Watt and Mrs. Godman, organized 4,000 Women's Institutes in England, Scotland and Wales during the war. Her Majesty the Queen is President of the Sandringham Institute, and the work already done by these, not only in the great war activities, but also in creating civic conscience and idealism, fostering handicraft and binding the Old Country more clasely to her far away children, is little short of marvellous.

The wider interests awakened during the war are being conserved by such organization as this. Much remains to be done of types of work which call for those traits of character with which women are particularly endowed.

The convention at Truro left a feeling of optimism in the mind of every delegate, and it is expected that great strides forward will follow. Plans have alredy been made for extending the work into every part of the Province. It is easily possible that some districts may have been overlooked where an Institute is desired. A letter addressed to Miss Helen Macdougall, Truro, is the first logical step toward organization.

AGRICULTURAL FILMS

The Nova Scotia Department of Agriculture has joined hands with the management of the D. A. R. to produce and exhibit moving pictures of all kinds of agricultural operations. These will shortly be available for any school house or public meeting in the Province.

A new film machine recently put on the market by the Pathescoje Co. of Canada, is especially suitable for this work, and has been adopted. For the current winter the Department, or, in the locality which it traverses, the D. A. R. will be in a position to send machines with operators into any community of the Province. These will be able to exhibit many of the most recent methods in agriculture.

Next summer an expert will be placed in the Province, who will take films of various operations as they are performed in the Province itself. This will give great additional interest and value to this class of work. Fuller announcement will follow. While the Department will plan to exhibit these pictures as a great many centers, yet special efforts will be made to reach thos which communicate their wish early.

POTATO GROWING CONTEST

The Department of Agriculture has associated itself with the D. A .R. in an effort to devote more attention to mixed farming in the western part of the Province. Preliminary to some other measures which will shortly be announced, a potato growing contest is being arranged. Cash prizes will be given, and the district to which the scheme will apply lies between a line west of the town of Annapolis to and including the municipality of Yarmouth.

For the purpose of this contest prizes will be given for the best acre of potatoes with but one condition, that every prize winning field must be sprayed with Bordeaux mixture, or dusted with an approved dust, to prevent rot, not less than four times during the season.

The main object of the contest is to secure the more general adoption among all farmers of the practice of spraying to prevent blight and rot, and also to increase the yield. Those who have tried it know that the tops of pottatoes sprayed remain green several weeks longer in the fall, and in a reasonably good field, for every additional day the leaves remain green, the yield increases approximately five bushels per acre. Fuller announcement of this contest and of detals will appear in our columns at a later date, but, in the meantime, parties who are interested should write the Department of Agriculture at Truro, or the Freight Department, D. A. R., Halifax.

Nova Scotia Egg Laying Contest

Entries for first event of its kind in the Province are numerous. Particulars will be published monthly in the Maritime Farmer.

The First Nova Scotia Annual Egg Laying Contest has been inaugurated at the Agricultural College and consists of 30 pens of fowls chiefly pullets. This contest begins on Saturday, November 1st, and continues until September 30th, 1920. Each entry consists of five birds, hens or pullets, male birds are excluded in this contest. Nearly all the pens with the exception of two are pullets. The houses have been erected at the East end of the Poultry Department on a plot of freshly seeded ground and contains four trap nests in each pen. Also a dry feed hopper, grit shell box, a record file, a hopper for hard grain and a small wooden feed trough. The results of the contest will be published weekly, giving the number of eggs produced by each hen in each pen. A systematic record of the quantity of feed will be kept in order that at the close of the contest an accurate estimate of the cost of producing the eggs will be made.

To learn how to increase the yield is the real purpose of this contest. It will also show vigor and vitality in the different flocks represented in the contest. The average production of the hens in Nova Scotia according to the last census is about 80 eggs per hen. This perhaps does not, at the present price of feed, any more than maintain the fowl for a year. An increase of 10 to 15 eggs per hen for the 1st, selection, 2nd from breeds the most productive layers and 3rd from proper feeding of formulas worked out through long experience so as to produce eggs and 4th from proper housing with due regard to cleanliness, fresh air, and pure water would result in an immense economical gain to the farmers and poultrymen of the Province of Nova Scotia.

The interest in the entries as received has become very keen and a number of breeders who have entered their pen are staking their reputation upon their pen coming out of the contest at the head of the list. The following is a list of entries and Breeders represented in this First Annual Contest. These contest pens are not open to the public, but may be visited from outside of the pens by those who are interested. Weekly reports will appear giving full details, and information can be obtained from the Manager of the Poultry Department Agricultural College relative to one or any of the pens in the contest.

List of entries of the First Nova Scotia Egg Laying Contest with Breed and Variety:

Pen No. 1—E. C. Griffin, Port Williams, N. S. Rhode Island White pullets.

No. 2.—John R. McDonald, Box 844, Glace Bay, C. B. S. C. White Leghorn pullets.

No. 3.—John R. McMullen, Truro, N. S., Barred Plymouth Rock pullets.

No. 4.—Wm. A. Reynolds, No. 3 Edinburgh St., Halifax, N. S. White Wyandotte pullets.

No. 5.—J. W. Williams, Wolfville, N. S. White Wyandotte pullets.

No. 6.—Robert M. Reid, New Glasgow, N. S. White Wyandotte pullets.

No. 7.—Dr. H. W. Cain, Falmouth, N .S. Rhode Island Red pullets.

No. 8.—Wm. Beazley, 17 Seaforth St., Halifax, N. S. Buff Wyandottes.

No. 9—J. Everett Spencer, Mira Gut N. S. S. C. White Leghorn pullets.

No. 10.—Evangeline Poultry Yards, Wolville, N. S. White Wyandotte pullets.

11.—W. W. Osborne, New Glasgow, N. S. S. C. Buff Leghorn pullets.

12.—E. C. Griffin, Port Wililams, N. S. Rhode Island Red pullets.

13.—F. E. Jackson, North Sydney, N. S. Barred Plymouth Rock pullets.

14.—James McIntyre, Dominion No. 4, C. B. S. C. Leghorn pullets.

15.—W. J. McKinnon, Truro, N. S. Ancona pullets.

16.—Duncan Frased, Antigonish, N. S. Barred Plymouth Rock pullets.

17.—C. F. Gallant, Caledonia Mines, C. B. White Wyandotte pullets.

18.—Nat Doherty, Franklyn St., Halifax, N. S. Barred P. Rock pullets.

19.— Miss Helen King, Box 765, Halifax, N. S. Buff Orpington pullets.

20.—Mrs. Jos. Milligan, Kings Head, Pictout Co. White Wyandotte pullets.

21.—Messrs. Parry & Sim, Billtown, N. S. S. C. Brown Leghorns.

22.—Edison E. Eagles, Box 34 Windsor, N. S. White Leghorn hens.
S. C. Ancona pullets.

24.—A. A. Sutherland, Westville, N. S. Rhode Island Red pullets.

25.—C. B. McMullen, Truro, N. S. S. C .Rhode Island Red pullets.

26.—William Guy, Glace Bay, C. B. R. C. Brown Leghorn pullets.

27.—John Retson, Truro, N. S. Rhode Island Red pullets.

28.—W. H. Henry, Shubenacadie, N. S. Rhode Island Red pullets.

29.—Robert H. Evans, Box 192, Trenton, N. S. S. C. White Leghorn pullets.

30.—W. A. Warren, Bridgetown, N. S. Barred Plymouth Rock pullets.

In summarizing the above there are six pens of White Wyandottes, six pens of Rhode Island Reds, five pens of White Leghorns, five pens of Barred Plymouth Rocks, two pens of Anconas, one Rhode Island White., one Buff Wyandottes, one Buff Leghorns, one of Buff Orpingtons and one Single Combed Brown Leghorn and one Rose Combed Brown Leghorn.

CANADIAN NATIONAL RAILWAYS WILL JOIN CAMPAIGN

TO BOOST THE VICTORY LOAN.

Energetic Campaign to be Carried on Over All Parts of the Government System—Every Employee a Bondholder

"Every Employee a Bondholder in the 1919 Victory Loan."

This is the keynote of the Campaign that is being carried on over the entrie system of the Canadian National Railways to further the Bond Issue.

From the Atlantic to the Pacific the employees of the great system of railways under Government control and operation are being urged to join in the movement to boost the Victory Loan and to invest their savings so that Canada may be enabled to carry on the stupendous task of reconstruction—and make payment of her Debts of Honor.

The Railway employees are being asked to join with all true Canadians in the great effort to restore Canada commercially, to help her keep her factories busy and her farms productive.

The proceeds of this Loan will be spent in Canada for capital outlay in ship building and in purchase of rolling stock and steel rails for our railways. It will be used to establish the credits whereby European Nations hungering for our products may be supplied, thus stimulating our export trade, and giving empolymnet to countless thousands. Canada asks her people to lend—not to give their money. The Victory Bonds bear interest at 5½ per cent. and no better investment for savings could possibly be found.

The Railway has again arranged with its Bankers to finance the subscriptions of employees on the extended payment plan based on pay roll deductions of ten (10) per cent monthly.

The Management of the Canadian National Railways has addressed an appeal to all employees asking their co-opeartion, and the Railway organization is being completed to carry on the campaign in every section of the Railway system.

THE MARITIME FARMER

And Co-operative Dairyman
Registered Trade Mark

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definite order for discontinuance is given,

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME PUBLISHING CO. or
R. D. Robinson Publishing Co., Limited
Sussex, N. B.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

NOVEMBER 11, 1919

THE DRIVE FOR PURE BRED SIRES

Throughout Canada and several of the American States vigorous propaganda work is being carried on with a view to eliminating the use of grade sires from the herds and flocks of the country. The Ontario Government has already placed its veto upon the use of grade stallions within that province and while the law has only been in operation for a short time, there seems to be general satisfaction among the farmers and more particularly the horsemen, who evidently realize that any marked improvement made in the quality of our horse flesh must come through grading up. The grade stallion has also been banished from [illegible] States adjoining the border, so that the outlook for his early demise all over the land must be considered favorable.

The crusade of improvement to be undertaken next is to get rid of the grade bull, and progress in this direction promises to be far more rapid than happened in the case of the grade stallion, for back of the movement stands communnty interest, which coupled with individual effort, and both working simultaneously, is bound to result in the quick downfall of another speimen of the bovine family that has outlived his period of usefulness. And the sooner the scrub bull of either grade or inferior pure-bred breeding can be replaced the better, because to a very large extent this animal has been responsible for the low production per cow in milk, and the needlessly poor quality in beef. With thousands of cows in this country yielding anywhere from ten to twenty thousand pounds of milk per year, indicating what it is possible to attain through better breeding, it is to be regretted that the general average per cow for the whole of Canada is less than five thousand pounds a year. Such a condition of affairs is both uneconomic and unnecessary and the quickest, most direct and practical means of overcoming it, is through the use of pure-bred sires developed for a definite, useful purpose.

But once the use of the pure-bred bull becomes general throughout the country, the process of grading up both feed and dairy herds will likely be quickly accomplished, for experiments and practical experience go to show that when good sires are used most of the individuals in a grade herd resemble pure-bred animals in general appearance. Then in a few more generations, under skilful breeding, the former scrub stock is graded up to such an extent that for the production of milk and beef, they are practically as useful as pure-breds. After all, the only difference between a "high-grade" animal and a pure-bred of equal merit, lies in its value for breeding purposes. The latter only can be used in the reproduction of pure-bred breeding stock, and moreover, only pure-breds are eligible to record in the official herd-books.

The cost of desirable pure-bred sires is probably the most important obstacle to be overcome in connection with this campaign for live stock improvement, for in this as in everything else supply and demand will govern prices. But there is no reason to think that this should be an insurmountable difficulty. Co-operative ownership on the part of neighbors and farmers' clubs can be entered into and thus keeu down the expense considerably. Many of our largest and best breeders have always been joint owners of bulls, and if they can do it why not the average farmer? However, another view of the matter is that as the movement proceeds and the demand increases, there will be added stimulus to greater production of pur-bred stock of good quality, type and breeding, and this will in time have the effect of bringing prices down to a more reasonable level.

In supporting the movement we would like to see the campaign widened to take in the "scrub pure-bred" sire, because he is just as great a menace to the live stock industry as the ordinary grade bull, and as long as he is permitted to do service, we cannot expect to accomplish all that is desired. Of course, it may be hard to regulate this matter at first, but no time should be lost in working out ways and means of doing it, and in this work the breeder must play an active and important part. He is the one who stands good to get the first benefit through the sale of his surplus stock, therefore, he should be the first of all to fall in line with whatever action may be deemed advisable to take in the matter.

THE FARM AND THE BOY

The farm boy, trained to self-reliance, to the performance of regular duties and to hard labor, has a tremendous advantage in the world. He has a sound mind and a strong body. He realizes that the old farm is a pretty good place to live and the chances are ten to one that he would prefer to stay on his father's farm, if the father can make the farm pay well and plan the work so that it is interesting and progressive. It is when the farm becomes unprofitable, unprogressive, and the work hard and monotonous that the boys set their faces resolutely away from the farm, says a well known American writer.

It is a great thing when fathers take their sons into their conldence and when the sons tell their fathers all their hopes and plans, knowing that they are sure of encouragement and sympatry. This confidence between father and son is necessary before the boys can be brought to understand the problems of the farm. The wise father has a set of books, and lets the boy help keep them. In this way the boy understands the father's problems and is not slow to grasp the situation. If they have had a bad season he feels that they have made their sacrifices together and that together they will endeavor to make good the losses the next year. Such co-operation not only makes the boy's life more pleasant, but it mainttains a complete confidence and the boy respects the father the more for his toil, his sacrifices and his failures. Tell your boy more about your business and enlist his sympathies and cooperate in working out the problems of the farm.

The old theory that the old homestead should fall to the boy who had no ambition to make good elsewhere and be exploited and managed in a sort of half-hearted way has been exploded by the son himself, who has in many cases turned out much better than the members of the family who descended like moths upon the white lights of the city. In the wreckage of this old thory can be found thousands of perfectly good farmers dragging themselves through the routine of office and shop work in the city. Of course, the work they are doing is useful and necessary, but to a man who understands their prospects are not glittering. The exiled farm boy who has failed to make good in the city can testify to the truth of the above statement. The wise father is taking his son in hand, and by example is doing more to keep him on the farm than any other agency. This is a sign of wholesome progress and a rebuke to the soft-hearted gentry who look upon farmers as sociological specimens.

CARE AND CREDIT

The farmer or town property owner who keep his property in a good state of repair and painted has a higher standing with his banker and a better credit rating, than has the owner of a similar property whose premises always exhibit a slovenly appearance. This may be a new idea to a good many people, but nevertheless it is strictly true, and its correctness has been clearly proven by the answers received from a questionnaire sent to a number of bank officials.

The bankers defend their stand in two ways. In the first place they claim that a property which is well preserved, and is graced with an attractive coat of paint, actually has a higher selling value than a similar property that has received less care. From this one reason alone it is not difficult to see why the shrewd financial man considers the neatly kept property the better security for a loan.

But leaving aside the matter of actual value, there is another angle to the situation that is of no mean importance. The banker has learned—perhaps by bitter experience—that before making a loan, not only must he be sure that the applicant can give good security, but that he must size up the man as well as his backing, before saying the word as to whether or not he shall be recommended for a loan. To use the words of one of the bankers, "as a man is, so are his buildings." Tidiness is an omen of thrift, while slovenly habits are too often the trademark of a n'er-do-well.

In short then, ordliness about the farm, in addition to carrying with it no small measure of personal satisfaction, may be, in a pinch, actually capitalized and be made to take on a commercial valuation, and with this fact in mind the occassional outlay of a small sum for paint or whitewash materials, must be considered a sound investment.

* * *

"No, I'm not going to sacrifice my herd this fall. I think by careful calculating the available feed supply can be made to last until spring. If I sacrifice now and buy agains next year I would be behind instead of ahead." This was the view expressed by a farmer, who claimed to be the owner of a herd of milking shorthorne. There seems to be a good sized nugget of commonsense in this policy.

Yield and Relative Value of Some Dairy Products

TABLE III.

Showing the prices which must be obtained for cheese and butter to give the same net return for one hundred pounds of milk testing 3.5 per cent of fat, or for one pound of fat or for one pound of "fat and casein (fat + 2).

30.25	2.61	66.25	74.57	47.45
30.50	2.63	66.75	75.14	47.81
30.75	2.65	67.00	75.71	48.18
31.00	2.68	67.75	76.57	48.72
31.25	2.70	68.25	77.14	49.09
31.50	2.72	68.75	77.71	49.45
31.75	2.75	69.50	78.57	50.00
32.00	2.77	70.00	79.14	50.36

The figures in Table III. are worked out on the following basis:—

	Cheese.	Butter.
1 pound fat produces	2.65 pounds	1.20 pounds
100 pounds 3.5 per cent milk produces	9.30 "	4.20 "
Cost of making per pound	2¼ cents	4 cents

TABLE I.

Showinb approximate yield of different products from 100 pounds of milk containing 3.5 per cent of fat and 12.5 per cent of total milk solids.

Product	Pounds.		Pounds.
Cheese	9.30	and Whey	90
Butter	4.20	and Skim milk	90
Evaporated Milk (Unsweetened	39.68		
Condensed Milk (Sweetened)	39.68*		
Milk Powder	12.75		
Cream Powder	4.77	and Skim milk Powder	7.62
Skim milk Powder	8.23	and Butter	4.20

*The yield indicated is obtained from condensing 100 pounds of milk to which a certain quantity of cane sugar (usually 17 to 19 pounds) has been added before the condensing process is started.

TABLE II.

Showing approximate yield of Canadian cheddar cheese and butter from 100 pounds of milk containing different percentages of fat.

Per Cent of Fat in Milk	Pounds of Cheese from 100 Pounds of Milk.	Pounds of Butter from 100 Pounds of Milk.
3.0	8.52	3.60
3.1	8.73	3.72
3.2	9.02	3.84
3.3	9.14	3.96
3.4	9.21	4.08
3.5	9.30	4.20
3.6	9.39	4.32
3.7	9.50	4.44
3.8	9.72	4.56
3.9	9.90	4.68
4.0	10.08	4.80

If 1000 pounds of milk testing 3.5 per cent of fat produces 9.3 pounds of cheese, which is sold at the prices indicated in column 1, with a manufacturing charge of 2¼ cents per pound of cheese deducted, and the value of the whey not taken into consideration:—

Column 2 shows the net return for 100 pounds of milk;

Column 4 shows the net return for 1 pound of fat;

Column 5 shows the net return for one pound of "fat and casein," if the proceeds are divided according to the "Fat + 2" method.

If 100 pounds of milk testing 3.5 per cent of fat produces 4.2 pounds of butter, for which a manufacturing charge of 4 cents per pound is deducted and the value of the skim milk is not taken into consideration:—

Column 3 shows the price at which the butter must be sold to realize the same net return 100 pounds of milk or per pound of fat or per pound of "fat and casein" as is shown in columns 2, 4 and 5, respectively.

If a producer knows what net price he can realize for 100 pounds of milk or for one pound of "fat and casein," as the case may be, this net return may be located in column 2 or column 5, and the same line in column 4 will indicate the net price which must be obtained for 1 pound of fat to equalize the price being obtained by either of the other two methods.

The value of the by-products (whey and skim-milk) varies, since at times it is impossible for the producer to feed all of the by-products, and since their value depends also on the probable market value of the stock to which they are fed. Consequently, the value of the by-products is not taken into consideration in Table III. Each producer may estimate the value of the by-products in his own particular case and add the estimated value of the by-products to the value of the milk as shown in this Table. Table I shows the pounds of by-products from 100 pounds of milk.—

In order to ascertain the net return of milk testing other than 3.5 per cent of fat, the net value per pound of the cheese or butter must be determined by subtracting the cost per pound of manufacturing from the selling value per pound of the product. This net price per pound, multiplied by the yield of the product per 100 pounds of milk as shown in Table II. will give the net return for 100 pounds of milk. The net return for 100 pounds of milk divided by the per cent of fat in the milk will give the net return for one pound of fat.

For example:—If milk tests 3.8 per cent of fat while cheese sells for 24½ cents per pound and the cost of manufacturing is 2¼ cents per pound, the net value to the producer of 1 pound of cheese is 24½ cents—2¼ cents= 22¼ cents. Referring to Table II, 100 pounds of milk testing 3.8 per cent of fat will produce approximately 9.72 pounds of cheese. Therefore the net return of 100 pounds of milk is 9.72 × 22¼ cents =$2.16. The net return for 1 pound of fat is determined by dividing $2.16 by 3.8, which gives 56.84 cents. The value of the same milk manufactured into butter may be determined in a similar way if the market value of butter is known. If the cost of manufacturing differs from the figures used in the table, the correct figures may be substituted.

The November 25th issue of The Maritime Farmer will contain a full report of the New Brunswick Crops Competition for 1919. A copy will be mailed to each and every prize-winner.

SOME RESULTS FROM ONE APPLICATION OF GROUND DRIED SEA WEED

(Experimental Farms Note)

When, on account of war conditions and the consequent scarcity of German potash, efforts were being made to secure potash from other sources, the Experimental Farms made a test of the use of sea-weed as a source of potash. To put this material into a portable and commercial form it had to be dried and ground. This work was done in an experimental way on the Nova Scotia coast and some of the product was sent to the Fredericton Station for test.

Both field and plot tests were made with potatoes.

In the field test an area with an application of 1,000 lbs. of a 4-10 fertilizer per acre and no seaweed gave 178 bushels per acre. A similar area with the same amount of the same fertilizer and 1500 lbs. of ground seaweed gave 230 bushels per acre. A third area with 18 tons stable manure and 750 lbs. seaweed per acre gave 242 bushels per acre, and a fourth are a with 18 tons per acre of stable manure alone gave 232 pushels per acre. Green Mountains potatoes were grown and it was noticed that the plants on the sea-weed area stood up grener later in the season than where no potash was applied.

Calculating the cost of the seaweed at $15.00 per ton, for which it was stated it could be landed at Fredericton, there was a credit of 52 bushels for the 1500 lbs. of seawed used where only commercial fertilizer was applied. As the seaweed used cost but $11.25 and the e xtra potatoes were worth at least $1.00 per bushel, this test showed a splendid profit from the use of the seaweed.

When stable manure was used however the increas of only ten bushels per acre for 750 lbs. of seaweed showed only a profit of $4.38, indicating that the potash in the stable manure supplied the needs of the crop to a considerable extent, and emphasizing the value of stable manure for the potato crop as against a non-potash commercial fertilizer. The following year on the oat crop there was no practical difference as between the diffrent applications—nor was any difference noticeable in the succeding clover crop.

In the plot tests of one-tenth acre each with Empire State potatoes, seaweed at the rate of 1,000 lbs. per acre gave a yield of 255 bushels per acre and at the rate of 2,000 lbs. per acre 257 bushels per acre. The succeeding wheat crop was so badly diseased with Glume spot that the yield was almost negligible and not at all to be relied upon for a satisfactory test. Seaweed at the rate of 1,000 lbs. per acre gave 9 bushels and 20 lbs. per acre, at the rate of 2,000 lbs., 7 bushels and 40 pounds, while the check plot gave 5 bushels and 30 lbs. per acre.

While the above data are of too limited a scope from which to draw comprehensive conclusions, the evidence, so far as it goes, shows that if seaweed can be dried and ground and transplanted for $15.00 per ton, it would have a place, and a profitable place among fertilizing materials.

Near the shore where the seaweed can be had for the hauling its almost universal use with satisfactory results confirms its value as a fertilizer.—W. W. Hubbard, Supt. Experimental Sta., Fredericton.

THE BEST FARM PAPER

Toronto, Ont., Oct. 16, 1919

The Maritime Farmer,
Sussex, N. B.

Gentlemen:—

Kindly let me know how much you charge per year for "The Maritime Farmer." I looked all through your paper and could not find it. I wish to send it to a farmer in Ontario for a Christmas gift as he thinks it is the best farm paper on the market. Have given him some of my office copies at odd times.

Yours truly,
THE DODD'S MEDICINE CO., Ltd.
Sgd. (Miss) I. E. RUSHBROOK,
Advertising Manager.

HORTICULTURE.

ACTIVITIES OF THE NEW BRUNSWICK DEPT. OF AGRICULTURE

The Provincial Department of Agriculture have, in the past two years, in connection with their increased production movement, been working out an educational policy, to induce the farmers of New Brunswick to raise their own timothy and clover seed, and, in order to make a more extensive market for our fall fruit, have had Mr. Turney, of the Horticulture Division, co-operating with the New Brunswick Fruit Growers' Association, cater to the Montreal market by careful packing and grading.

The orchards of New Brunswick have been producing for years past enormous quantities of this excellent variety of fall fruit, that has always been disposed of in our local market, and never found a demand that was commensurate with the quantity produced; consequently were sold for $1.25 or $1.50 per barrel.

The Fruit Growers' Association this years, under the direction and supervision of the staff of the Provincial Horticulture Division, in the New Brunswick Department of Agriculture, have properly graded and packed several car-loads of fall apples, with the result that they have found an unlimited marke at a price which netted the producer over $4.00 per bbl—fifty cents per barrel more than that was paid for Nova Scotia fruit of a similar variety.

Hundreds of thousands of dollars are annually sent out of New Brunswick every year for grass seed, which the farmers can raise themselves, of a quality superior to that which they import. The Minister in the Department—a practical farmer—being satisfied that New Brunswick can raise its own seed, has been endeavoring to save this money to the farmers, by inducing them to grow their own seed. To demonstrate that he is sound in his judgment in this matter, for the information of the farmers, there is a case in point.

The Minister advised Mr. George McLaughlin, at Perth, N. B., to thresh his clover hay for seed this year. He had about twenty tons which, if sold for hay, would have realized about $300.00. Mr. Woods, of the staff of the Provincial Department, at the direction of the Minister, threshed it and produced 3,500 lbs. of good clove seed, which is worth in the market today 50c per lb. and will net Mr. McLaughlin $1700.00.

Fruit Packages

We Manufacture Strawberry Boxes and Crates for same, 6 qt. Baskets, Apple Boxes, Box Shooks, Apple Graders, Wheelbarrows. Now is the time to lay in a supply of Fruit Packages for the coming season. We have a good stock on hand, order early and ensure prompt shipment. Price on application to

HANTSPORT, N. S.

THE U. F. MOVEMENT

The farmers of Canada have not only united, but their action in the recent electoral contests in Ontario and in Carleton-Victoria, New Brunswick, show that they can stick together for a common cause. Too long have the farmers of Canada been under the sway of the devotees of other callings. The tide has turned and our farmers are destined as never before to help mould the policies of Canada.

Agriculture is recognized as the most important industry in Canada. The election of farmer candidates to take their place on the floors of the federal and local houses to represent the agriculturists, is a sign of progress. Sane action, with no attempt at class legislation should be the motto of the farmers' representatives. It will help them to attain and maintain the representation that their calling warrants. The agricutlural counties of the Maritime Provinces should see to it that a strong farmer candidate is included in the ticket of both Liberal and Conservative parties at future elections. Men who are broad minded enough to throw their influence where it will do the most good, repardless of political affiliation.

DRY VERSUS WET PLOWING

Editor Maritime Farmer:

As I have often noticed enquiries answered in your valuable publication, I am herewith making bold ti ask for information on a question peculiar to farm-work. This fall our section, here, has had but a very scant rain-fall, the consequence of which being that the land is very dry; as a result the farmers have been putting off fall plowing in hope of rain; many indeed have not turned a furrow yet. Now my patience is not of the "Job" type and came to an end before the little cloud appeared in the sky.

Well, I started plowing and the neighbors criticing. With one exception they declared I was ruining the land, preparing for a large crop of weeds and small crop of grain. I maintained that it would do no harm. The land referred to is a clay loam and if a handful was picked up from furrow, it would fall apart like the soil of a garden after a recent cultivation. Now this brings up two questions: (1) Who is correct the neighbors or your humble servant?

(2) If dry plowing is detrimental to the soil, what is the result and why?

I would like to have your valued opinion on above, and will engage to let you know, after the harvest, method of cultivation and fertilizing used, and the resultant crop per acre, if you think it would be worth while to follow up so far.

Hoping to see a discussion on above in the "Maritime Farmer."

HEBRR TRATT,
Cumberland Co., N. S.

Ans. Practical agriculturists do not favor operations on wet soil, as there is a tendency to so pack and puddle soil worked under this condition, so that it is difficult to work it up into a proper seed bed. We see no reason why soils such as you describe should be adversely affected by plowing when the weather is dry. Tight, hard clay soil does not plow very easily in dry weather and consequently it has to be handled when the work can be done to the best advantage, and not infrequently frost overtakes the work which must then be deferred until spring. Let us have farmers' opinions on this question.

The Maritime Farmer will be pleased to hear from Mr. Tratt again.

HARVESTING ROOTS FOR SEED GROWING

(Experimental Farms Note)

The last few years has taught us that field root seed raised in Canada campares very favorably with imported root seed and under the circumstances it would be to the inter-

SUSSEX, N. B.

est of farming, were more root seed produced in Canada than there is at present.

It should be clearly understood, though the value of the root seed produced in this country depends to a very great extent on the quality of the roots from which the seed is to be raised. The roots set aside for seed production should represent a uniform type, that is to say they should be of the same general shape and of the same color. If they are of mixed types, as far as shape and color are concerned, they are liable to produce a class of seed which, when sown, will in turn give rise to a crop of mixed, and on that ground inferior, quality. It is therefore of paramount importance that roots which are to be used for seed production be as uniform as possible. They should of course also be perfectly sound and free from diseases.

It is of less importance of what size they are, but, generally, medium-sized roots are to be preferred because, as a rule, they keep better in storage during winter and therefore are apt to produce healthier and more vigorous seed plants.

The roots which are selected for seed production should be handled very caerfully and all bruised roots should be rejected. In the first place, roots that are bruised, or cut, or broken in harvesting, may rot during the winter and, in doing so, may cause damage to the sound roots stored with them. And, besides, even should they come through the winter, they will most likely produce weak seed plants, unable to form and ripen seed of best quality. Roots selected for seed production must, therefore, be stored away intact; that is to say, their lower ends and rootlets must not be cut off, as is done when roots are harvested.

Roots that are expected to develop seed bearing stalks after having been stored during the winter must not be topped too closely. Remember that the seed stalks sprout from the crown of the roots. It follows, then, that if the roots are topped so closely that their crowns are cut off or injured, there will be no chance of any seed stalks developing. Consequently, roots selected for seed production must have their crowns perfectly intact. And for this reason it is recommended that all roots selected for seed production be topped well above the crown, say anywhere from half an inch to two inches, so that their ability to develop vigorous seed stalks may not be impaired.

The roots selected should of course be stored in the best manner possible so that losses through rotting during the winter may be avoided. The storage methods are many and vary with the winter conritions. In case there is any doubt as to the best manner of carrying the roots through the winter in a satisfactory condition, the undersigned will be pleased to render advice based upon years of experience. —M. O. Malte, Dominion Agrastologist, Central Experimental Farm, Ottawa, Ont.

SUMMER TREATMENT OF CANE FRUITS

Cane fruits, including raspberries, blackberries and dewberries, growing under normal conditions, produce strong, vigorous shoots from the crowns early in the spring. These become the fruiting canes the following year. Dhen they get to be about two and one-half to three feet high, they should have their terminals pinched back an inch or two to stimulate the formation of lateral 'or branch shoots. This makes a more compact bush, that is less subject to winter injury and that under ordinary circumstances is more productive. The shoots should not be allowed to reach a height of more than two and one-half or three feet. The laterals should then be allowed to grow as long as they will, no heading back being afforded them until the beginning of the following season, when they may be shortened to a length of 12 to 18 inches.

If for any reason the new shoots of the cane fruits have been allowed to become four to six feet tall without pinching, thy should noe be headed back during the summer . Such late heading would be liable to force the production of laterals that would not mature well before winter and that consequently would be more subject to winter injury.

As soon as the fruiting season is over, the old canes that have borne fruit should be pruned out, carried off the patch or field and burner. Many growers neglect to remove these old canes until the following spring; but it is important that they be removed promptly. If left during the summer and fall months, they harbor insects and diseases that spread to the new growth, decrease the next year's crop and shorten the life of the plantation. As a matter of fact, the best and most effective way to deal with the insect and disease problem in the cane fruit plantation is to cut out and burn the old canes immediately after each fruiting season. They have to be removed anyway, and it is no more expensive or troublesome to remove them then than later. When this plan is followed, spraying seldom needs to be resorted to, for the cane fruits.

Commercial plantings of the cane fruits should receive thorough cultivation throughout the growing season. In the case of small home plantings, heavy mulching with straw leaves, corn stalks, lawn clippings, etc., may take the place of cultivation. This helps keep down weeds, conserves themoisture, keeps the soil cool during hot summer months and otherwise promotes the health and growth of the plants.

AUTO TIRES FOR 1920

The Maritime Farmer will have an exeptionally fine auto tire servie for 1920. We have arranged for next season's business and for automobile owners who will require tires, we have only this to say, write us early for any size you stand in need of. We will have the ordinary every-day rubber tire cords. We can quote you on small tires now. They are all firsts, guaranteed for 3,500 miles, but tires we sold this year have run 8,000 miles and are still going. WE HAVE NOT HAD A SINGLE CLAIM AGAINST ANY TIRE SOLD BY US IN 1919. The only stipulation that we make is that you shall be a subscriber to the Maritime Farmer. Tires may be higher next year. There is some talk of a 25 per cent. jump. We can save you that if it does come provided you send us your specifications now. On small tires we have a most attractive offering. Later we shall have prices on cord tires of all sizes. Don't wait until you want the tire. Send in your order now and we will book it and hold for shipping date.

WE boost "Invincible" Rubber Boots and Shoes but the biggest booster is the man who wears them. He knows they cannot be equalled for wear. He knows they last longer than any other make he ever bought. Buy your first pair of "Invincibles" and you will boost "Invincibles" to your friends. You will tell them they are the best pair of rubber boots you ever had. We know it now. You will know it too if you ask for and get "Invincibles" the next time you buy rubber boots.

"Invincibles" are Pressure Cured. The high Pressure Process alone can put into rubber the strength and resistance to stand all kinds of use and abuse in quarries and mines, on the roads in the woods or on the farm.

DAIRYING.

MILKING MACHINES HELP TO INCREASE DAIRY PROFITS

The real worth of the milking machine is asserting itself since so much of the work on the farm is performed by larger implements that cut down the numebr of men needed to keep up the work in the fields. It not only saves time and money, but it makes it possible to regulate the number of cows kept on the farm to the amount of feeding materials produced at a profit. Rapidly it is downing the prejudice that has led many farmers, unacquainted with these economic advantages, to assume that it is impracticable on the average farm.

Naturally it has been the dairy farmer of means who has demonstrated to himself and to his neighbors that the milking machine "makes good." It takes a grasp of economic principles and patience to adjust the barn and field work so that the milking machine will fall in with the regular routine of the year and give the maximum returns on the investment. Farmers were slow to accept the tractor as a suitable implement for their use. They are buying them now by the thousands, convinced that they will do for one farmer what they have done for others. The milking machine and the power outfit costs about one-half as much as a good farm tractor. It is wholly a utility machine and in ordinary drudgery of the most irksome kind it pays for itself in the saving of help in the barn.

Not Fool Proof

The experimental stage of milking with machines has passed. The scarcity of good milkers and the difficulties in distributing work on the dairy farm evenly throughout the year has prompted many dairy farmers to invest in milking machines. Reasoning stubbornly along the lines that it would cost more to operate the machine and do the necessary stripping, many dairy farmers have blinded themselves to the year's accomlishments. Perhaps a few minutes are lost in preparing the cows and following the machines to get the strippings, but what is that compared with the tired hands and time spent in getting the bulk of the milk.

The milking machine is not fool proof. A lot of good machines are not sufficiently in sympathy with the cows to make good milkers. Thousands of good milkers are not good enough mechanics to operate a milking machine successfully. The operator must be in sympathy with the cow so as to cater to her likes and dislikes and enough of a mechanic to keep hic machine in condition to do good work. He must be both a cow man and a mechanic to get the best results from a mechanical milker. As results with the mechanical milker. As a rule, failure results from the fact that the operator is a better mechanic than he is a cow man. The man who has milked the cows by hand knows their peculiarities and can adjust the machine to suit the different cows. Each cow must be handled and milked differently. If all of the cows are treated alike the machine cannot give its best results, but by understanding the cows and adjusting the machines properly any of the leading milking machines will do practical and profitable work.

Fitting the Teat Cups to the Udder

Generally speaking the proper time to begin using the mechanical milker is about the time the cows regain normal condition after the freshening period. During the latter part of the lactation period some of the cows are likely to hold up their milk often enough and long enough to cause them to dry up earlier than they otherwise would. At the beginning of the milking period the cows milk more nearly alike. The further the cows advance in the lactation period the more they differ in their peculiarities of milking. It is these peculiar traits that the machine operator must watch and endeavor to adjust the machine so that it will do its best work throughout the entire milking period.

Fitting the teat scups to the cow and keeping close watch to see that the teats and udder are in normal condition are importont points in operfating the milking machine. The cups should fit the teats so that they will get a straigth and proper grip and the pulsation of the machine should be regulated to suit the individual cows in the herd. The operator should understand how to arjust the machine to give the proper length of squeeze and length of release in order to make the machine do good work without discomfort to the cow. A short, quick plusation is not suitable for a cow with long teats that is a hard milker. On the other hand a long, slow pulsation is not suitable for a cow with short teats that give out the milk easily. The man who operates the machine should know his cows and adjust the machine to meet their individual requirements.

Clean and Sanitary Milk

Always wash the cow's udder and moisten the teats before the milking begins. Then, if there is some disorder with the teats or udder, such as garget or inflammation, she will attempt to kick or become uneasy. When the full milk stream is over strip the rest by hand. This gives an opportunity of becoming familiar with the cow's udder and knowing exactly its physical condition. It also trains the heifers to stand for either hand or mechanical milking. If any of the cows have udder trouble milk them by hand until they return to their normal condition.

Keep the teat cups clean and sterilize them after each milking. Never use them on a cow that is affected with teat or udder trouble. If properly cared for the teat cups are not any more frequent distributors of bacteria than the milker's hands. Naturally fiilthy, germ-laden teat cups will set up infecttion in some form, and the

The Most Profitable Method

Catch the Early Markets by Using

WHAT is your time worth? Rounding up your feed materials in the old way takes time; so does figuring of rations and mixing. Feeds on the farm vary in quantity and quality. The ration is liable to be too rich—or skimped. There is loss both ways, either in loss of feed at high prices, or loss of bacon due to imperfect feeding. In short, ordinary feeding methods cannot be accurate and economical.

Monarch Hog Feed

is calculated with accuracy by experts who have handled exactly the same hog feeding problems as you have. They know to a certainty just what Canadian hogs require. The special facilities that we have at our mills and you have not, insure Monarch Feeds always being properly balanced and thoroughly mixed. With these advantages we have produced a feed that will not only finish your hogs quicker and in better condition for market, but it will mean more and better bacon—the good, firm, solid quality that gets the attractive prices for you. It means least cost per pound gain. Guaranteed analysis: protein, 15%; fat, 4%.

Monarch Hog Feed has all the feeding advantages of corn products, shorts and digestive tankage. Owing to the splendid balance in this ration, these feeds are easily digested. Hogs scramble for this highly palatable feed. It gives size, vigor and stamina. It lowers your cost of production, and at the same time gets you the quality prices.

Order a ton from your dealer. You can depend upon deliveries. If your dealer cannot supply you, write us direct, giving dealer's name.

MONARCH DAIRY FEED
has guaranteed analysis of 20% protein and 4% fat. It is a properly mixed combination of Oil Cake Meal and Cotton-seed Meal with the bulky feeds, bran and corn meal. Though very rich, ensuring splendid results, it can be fed alone.

SAMPSON FEED
This general purposes feed is somewhat similar to Monarch Hog Feed, except that oil cake meal is used instead of digester tankage; it gives results for both cattle and hogs. Guaranteed analysis: 10% protein and 4% fat.

Advertise in the Farmer

use of unsterilized teat cups can have but one result finallly. From careful examination of milking machines on many dairy farms it is a wonder that undder troubles are not more prevalent than they are.

A few object to the milking machine because of hand-stripping to get the last few streams of milk. But no man can operate a milking machine successfully unless he keeps in close personal touch with the cows he is milking. An experienced man can operate the milking machine all day without becoming fatigued. He can strip the cows without becoming tired, but put him to milking all day and he will soon seek other employment.

The milking machine will make clean and sanitary milk, and it has come to a time when many breeders of dairy cattle and producers of certifield milk have found it necessary to use the machines or go out of business. The pails, being airtight, admit no dust and dirt, consequently there wil lbe practically no sediment in the milk. The bacteria that enter the milk must come from the cow's teats and from the contact of the milk with the rubber tubing. In the mechanical milker the milk travels throug about 24 inches of rubber tubing, which can be kept clean and sanitary. The other rubber tubing s for air vacuum and pressure.

Many dairy farmers have a well-earned reputation for being careless with their machinery. Such men are sure to have trouble with their milking machines. Dirt, rust, violent jarrings, filthy teat cups and unsanitary rubber trubes will soon tell on any make of milking machine and result in unsatisfactory milk , Manufacturers are taking pains to put out good machines and if properly cared for and intelligently operated they can eb depended on to last for years. Many a milking machine is condemned for defects which it develops under the blind eye of an owner who does not know how to use it. He blames it because he does not know his machine and his cows. Usually he makes matters worse when he tries to correct his failure to watch his cow's peculiarities by monkeying with the machine. While these machines require but slight attention, so far as ordinary work is concerned, they should be kept clean and have intelllgent inspection at intervals.—C. B. Ford.

MILK AND MUDHOLE GERMS

The farmer who keeps dairy cows has a job on his hands when the cows come up in the evening with their udders covered with mud and filth which they gathered in some stagnant mudhole in the wood lot or the pasture field. A lot of work is saved to the milker if the udders do not require a scrubbing at each milking time, and a lot of disease germs are kept clean. A mudhole filled with stagnant water on which a green scum is swimming is a very bad place to send the cows to seek relief from flies when on pasture. Such holes in the wood lot or pasture should be drained or filled, and unless a running stream is accessible the cows should be kept on dry land. Let the cows run inthe woods during the hottest part of the day if it is at all possible, as it will furnish them shade and a portection from flies. If no shade is accessible, it is a better plan to keep the cows in the barn during the hottest part of the day and then leave them on pasture during the night when it is cool and the flies are asleep. A pasture lot that is not clean and sanitary is not fit to use for dairy cow pasture. Milk is a good food when it can be obtained from a clean cow and kept in a clean place and free from germs and dirt.

Dependability

Trade Mark

THE KEYNOTE of the ALPHA Engine is dependability. It *runs* when you want it to, day after day, and you never need to worry about it. Its simple, sturdy construction makes it dependable.

The ALPHA power rating is *dependable*; if it is a 1½ Horse Power it will deliver *at least* one-and-a-half horse power; if it is a 28 Horse Power you can bank on getting more than 28—never less.

The De Laval Company is *dependable* — the largest manufacturers of dairy supplies in Canada.

If you don't know who handles the ALPHA in your vicinity, write nearest sales headquarters for his name.

LIVE STOCK.

EXCELLENCE IN THE RAM IS TRUEST SHEEP ECONOMY

The first fundamental recognized by the successful sheep owner is the absolute value of the pure bred ram. Farmers who own only a small flock of ewes should take note of this fact, and also, that fall is the best time to select the breeding ram. No matter what particilar line of breeding one may pursue, well developed conformation indicating strong constitution, should be a strong characteristic in the ram. It is ability to transmit vigor and early maturfity is the most important quality to be considered. Make a close scrutiny of you ewes, and weak points, by the weak ones, and resolve in your mind's eye the type of ram needed to bring about the desired improvements. Thus equipped with an idea of what you want, make a visit to some of the best flocks of the breed you desire, and keep going until you find out what you require. Do not get stuck on some finely conditioned ram lamb that is not just what you want, and thus make a compromise. Look further, and perseverance will bring its reward. You will not only be able to see the rams, but the stock from which they are bred; thus you will have some assurance that your purchase will produce animals like thosce in the flock where he was bred.

Choosing by Record

It is now a commonplace and true saying that the bull is more than half the herd, and it is equally as applicable to the ram amongst a flock of ewes.

Selecting a sire involves time and study, and commonly some expense. However, as it is the only opportunity to influence the inheritance of the lambs of the ewes that are to be bred, the effort is a necessary one. The owner's skill in breeding determines the success of the stock raising venture, and the selection of the ram offers the main opportunity for the investment of time and skill.

There are far too many men in all departments of the live stock industry who rest contented with having secured a registered sire. They make no further investigation, and forget that the advantage of eligibility to record is not in the fact of the registration of the ram, but in fact that registration makes it possible to know from what kind of stock the ram is bred. Some well bred, but unrecorded rams may be better breeders than some that are recorded. This is the advantage of registration, for one can look up back history. If choosing was done entirely by inspection of the flock, it might be somewhat misleading. Individual points cannot be ignored, but sheep that are old enough to have the offspring of several years to speak for them are not likely to be very attractive in themselves. But if they have proved good through their progeny ,they are the flock to choose from. The first parents constitute the most important part of a pedigree.

Choosing from Conformation

But even from proven pedigree stock there is some choosing to be done. Successful breeding even of pure-bred stock can only be maintained by grading up. As the number of generatons of careful weeding out of all substandard animals is added to, there is an increasing degree of purity of the blood, and freedom from the possible appearance of inferior features. This constitutes the necessity of also choosing a suitable individual apart from his breeding.

It is usual for the buyer to look for size, but a ram need not be a giant of the breed. Great size is not so important as early maturity, and a tendency to produce good cuts of mutton and a high quality of wool. The upstanding, big-looking type does not mature so early, and as a rule is not as economical in converting feed into mutton and wool as the more compact and thickly fleshed sheep. If a ram has the earmarks of a good sire, don't be disappointed with his feminine head and thin neck. Mutton and wool don't grow on these, but they are great indicators of where it is to be found in progeny. Rams with fine heads, narrow noses and light polls are disappointing breeders. A "goose" neck and a narrow chest are two other points to be avoided in the choosing of the front quarters. His nose should be broad, his head short rather than long and narrow, his jawbone heavy, his neck short and thick, carrying his head up with style. He should be alert in his movement and have a bright eye. No one ever saw a sheep that had a slow method of chewing the feed that was at the same time a healthy, vigorous one. Watch him when he is feeding.

Along with the depth and width of front, the ram must be round ribbed and square ended, with a good leg of mutton, his legs strong and wide apart, an dthe feet large, straight and open. Have nothing to do with crooked or clubbed feet. His underline should also be straight, showing depth as well as width of middle. No animal is well equipped without a capacious bread basket.

Though no ram should be bred to ewes that have not been well fed, do not make the mistake of choosing one overfed to hide natural defects. The shoulders should be broad on the top instead of sharp, and the back should be straight and smooth. Good flesh attained under ordinary care is a strong indication of health and abil-

ity to produce mutton, two things absolutely essential in lambs.

The age at which a ram is at his best is largely determined by the condition in which he is kept. It is not well to use an extremely old ram, unless he has been well handled throughout his career. Neither is it wise to use too young an animal, that it not well grown. From experience, the writer has found that very old rams have a low vitality of young lambs, while ram lambs often leave a very large percentage of lambs, but they are hardly ever as strong as the lambs from the same ram whe he is a year or two older. Britain, that is the birthplace of the majority of the best breeds of sheep and its leads in the work of development, never breeds with ram lambs. There are annual Fall sales in Britain where thousands of shearling rams are sold, and they realize very remunerative prices.

Ram lambs only do well as sires if well grown and used moderately; ten to fifteen ewes being the limit. A one-year-old when running in the field should serve fifty ewes. With proper attention and feeding by day in the yard and out among the ewes at night, he will accomplish more and leave better stock, than if left in the flock all the time, for his attention will be taken up with ewes to the extent that he will forget to feed himself, and a well fed ram is imperative to a numerous and healthy flock of lambs.

QUARTERS FOR THE BREEDING BOAR

One of the investments the breeder or farmer can make is a safe and comfortable house and yard for the breeding boar. It should be away from the rest of the hogs but connected with the other yards with a lane or driveway. A comfortable colony house and a strong iron fence inclosing a small yard, and a larger yard making altogether an acre of land will be sufficient to give him the necessary exercise and afford good grazing when the ground is not covered with snow. If the soil is good and the lot properly drained by a porous subsoil or tile it will produce a variety of grasses and clovers, such a combination as will suit the needs of the hog. Alfalfa is not well suited for the small yard so one must provide grasses that are. Orchard grass, timothy and red-top mixed will survive and last for years unless abused or rooted out. To start such a combination of grasses in the boar pasture prepare the ground in the spring, sow oats and peas mixed and seed with timothy, clover, orchard grass an dred-top mixed equal parts. The lot will be ready for grazing in six weeks. Such a seeding will come on and furnish grazing for a long time.

Alfalfa is such a valuable crop for grazing that it will pay one to have a field adjoining the boar's yard, so that he may have access to it when it is ready for grazing. If the growth is too luxuriant for him to to graze profitably alone turn one or two bred sows in with him to get the full benefit of the crop. By changing him as the conditions of growth in the two lots demand and allowing one or two sows to run with him when there is an abundance of grazing he will always have better grazing than when only a small lot is used. Of course, if he is to have good grazing he must have rings in his nose to prevent rooting.

Such a house, yard, and pasture for the boar will save a lot of unpleasant and risky work in caring for the hogs, more especially when an aged boar is kept on the farm. Besides there is no more disgusting feature of hog raising than to have breedinb boars breaking through fences and running about the premises rooting up the gardens and shrubbery and tearing up things in general . The man who takes pride in his work and keeps a breeding record of his sows will not allow his boars free run of the premises.—W. M. K.

Buying a cheap bull to save money is like stopping a clock to save time.

The condition of a farmer's fences bears heavily upon the aspect of his farm and upon the outsider's opinion of him.

TRAPPERS AND HUNTERS
For highest prices ship your RAW FURS direct to

We will send you a FREE SAMPLE of Hallam's Paste Animal Bait

This is an entirely new and much improved form of Animal bait—it is made in a paste form and put up in tubes (like tooth paste).

While possessing all the excellent qualities of the liquid bait it lasts longer and is unexcelled for attracting all flesh eating animals, such as Mink, Fox, Wolf, Lynx, Skunk, etc.

It is easy to carry, economical and handy to use, (simply squeeze out enough for your set each time)—not affected by snow or rain.

You can have a FREE sample for the asking (enough for 2 or 3 sets).

We will also send you Hallam's Trappers and Sportsmens Supply Catalogue, 48 pages, (in English and French) showing traps of all kinds, guns, rifles, ammunition, fish nets, shoepacks etc., at very moderate prices.

Hallam's Raw Fur News contains latest information on Raw Fur prices and market conditions, sent free on request.

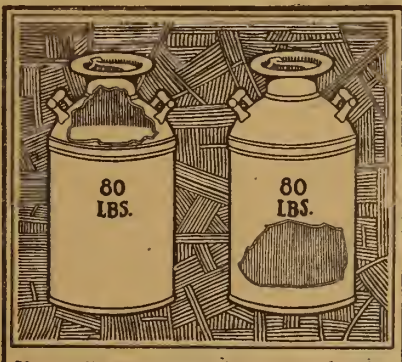
Mr. Alex. Moore, Oxford County, Ontario, waters his cows with water bowls. One day last winter the windmill broke down. This cut off the water supply and he had to drive his cows out to the barnyard trough. The weather was cold and blustery.

As a result his herd of 15 cows failed an 80 lb. can of milk the very first day. They kept on failing every day afterwards, until the windmill was repaired. Milk is 87% water and the cows did not drink enough. With their water bowls the water was always before them. It was always at the right temperature.



You will get the maximum production with water bowls. If you are not using them, did you ever reckon up what you are losing? At only $2.50 per cwt. an 80 lb. can per day for 200 days would amount to $400.00. If your 80 lb. can is empty, send in the coupon. It will not cost you anything, or obligate you in any way, to get particulars of the BT Water Bowl.

THE HORSE

THE FORELEGS OF HORSES AND THE DISEASES THAT FOLLOW THEIR BAD CONFORMATION

The forelegs of the horse, when viewed in front, should be widest at the chest and should gradually approach each other as they descend towards the fetlocks. The forelegs of far apart. His rounded chest enables him to throw more weight into the collar. But, above all, whether near each other or wide apart, they must be straight to have the firm, well-knit horse that will naturally keep free from the diseases that are so apt to come to the ill-placed leg. The elbow should not have the slightest inclination inward or outward. The horse that has the unsteady movement when run out before the judge generally has the elbow inclining inward. The toe will also project outward, and the foot thus fails to come flat down on the ground. Again, if the elbow is turned outward the toe will necessarily be turned inward and the weight of the asimal cannot be evenly distributed over the foot; the bearing cannot be true; there will be undue pressure on the inner quarter, and a disposition to splints an dcorns.

Viewed from the side, they should come down perpendicularly from the elbow. If they incline backward and under the horse there is undue stress on the extensor muscles and undue weight is thrown forward and the horse will be liable to knuckle over. The toe should be found precisely under the point of the shoulder. If it be a little more forward the horse will probably be deficient in action; if it be more under the horse the animal will naturally be deficient in pulling power.

Sprain of the Back Sinews

The horse that has his forelegs so placed that it interferes with his pulling power is very apt to develop sprain of the back sinews. This is the term that it usually gets, but it should be remembered that a sinew or tendon can never be sprained, because it is inelastic and incapable of extension. What really takes place, when such a symptom is shown, is when a horse has been over-worked or put to sudden violent exertion, the tendon presses upon the delicate membrane lining the sheath that envelopes the tendon and inflammation is produced.

The sheath for the tendons is composed of a dense cellular substance to keep the tendons in place and defend them from injury. Between the tendon and the sheath there is a mucous fluid to prevent friction, and when inflammation supervenes, adhesions are formed between the tendon and the sheath, and motion of the limb is more painful and difficult. The local swelling and heat, will clearly indicate the seat of the injury.

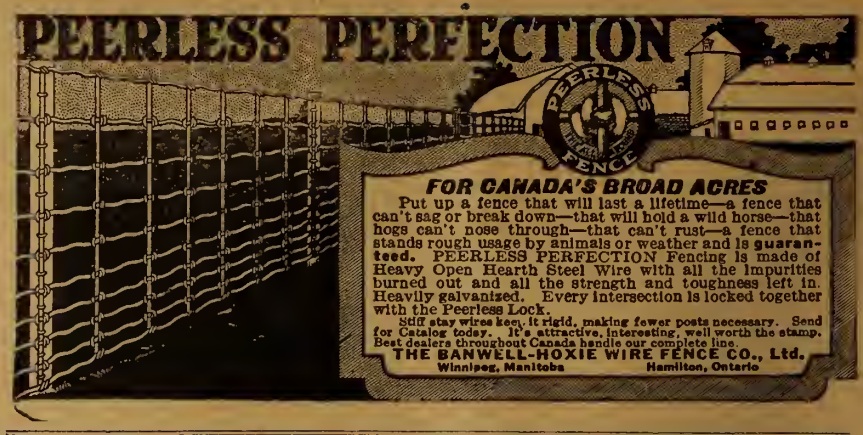
In the early stages of the sprain it is often difficult to diagnose the trouble, but if this part of the leg is examined closely the abnormal heat felt around the part and the pain which is caused on firm pressure of the hand will readily reveal the cause of the lameness.

No better treatment can be effected than by using an elastic bandage, one of thin flannel will be best. This will sustain and support the limb, while it is also the best means to absorb the coagulated matter of which the swelling is composed. If the bandage is kept wet with vinegar, to each pint of which a quarter pint of spirit or wine has been added, the skin will be slightly stimulated and contracted, and the cold produced by the constant evaporation will tend to subdue the remaining and deep seated inflammation. This bandage should be daily tightened in proportion as the parts are capable of bearing increased pressure, and the treatment should be persisted in for two weesk. If at the expiration of that period, theer be no swelling, tenderness, or heat, the horse may gradually, and very cautiously, be put to his usual work.

Ringbone

Ringbone is produced by violent inflammation of the ligaments of the fetlock joints, and is recognized by a slight enlargement, or bony tumor on each side of the foot, just above the coronet. Although when the bony tumor is small, and on one side only, there is little or no lameness and there are not few instances in which a horse with ringbone has worked for many years without lameness; yet from the action of the foot, and the stress upon the part, the inflammation and the formation of bone have such a tendency rapidly to spread, that the slightest enlargement of the pastern around the coronet is counted a case of unsoundness. In its early stage, and when recognized only by a bony enlargement on both sides of the pastern joint, or in some cases only one side, the lameness is not very great, if at all apparent. There is, however, so much movement and tear and wear of this part of the animal, that the inflammation and the disposition to the formation of the bone spreads rapidly, and any attempt to stop its growth by blistering or other similar method is not often followed with any measure of success. The final stages leave the joint fixed and the motion is lost, the whole of this part of the foot becomes a mass of spongy bone.

The best method of eradicating it is to desist from breeding with any animal that is so disposed, or is known to come of parentage subject to ringbone.



PEERLESS PERFECTION
PEERLESS FENCE
FOR CANADA'S BROAD ACRES
Put up a fence that will last a lifetime—a fence that can't sag or break down—that will hold a wild horse—that hogs can't nose through—that can't rust—a fence that stands rough usage by animals or weather and is guaranteed. PEERLESS PERFECTION Fencing is made of Heavy Open Hearth Steel Wire with all the impurities burned out and all the strength and toughness left in. Heavily galvanized. Every intersection is locked together with the Peerless Lock.
Stiff stay wires keep it rigid, making fewer posts necessary. Send for Catalog today. It's attractive, interesting, well worth the stamp. Best dealers throughout Canada handle our complete line.

Sand Cracks

A sand crack is manifestly an unsoundness. It is a most serious defect. It indicates a brittleness of the crust, sometimes natural, but oftener the consequence of mismanagement or disease, which, in spite of every means adopted, will probably be a source of future annoyance. On a hoof that has once been thus divided no dependence can be placed, unless, by great care, the natural suppleness of the horn has been restored and is retained.

If the crack has penetrated through the crust, and lameness has ensued, the case is serious. It must be carefully examined to ascertain that no dirt or sand has got into it; the edges must be considerably thinned, the fissure cleansed, and hot fomentations and poultices applied. Previous to this the shoe should be removed and when the inflammatory symptoms have abated a bar shoe should be applied to the foot, and the edges of the crack brought together and clasped with clamps that can be had of any surgical instrument maker.

The growth of the horn proceeds from the coronet downwards, and unless this is perfect the horn will grow divided. The method adopted here is to blister the coronet well over the part that is divided. Some inflammation will ensue, and when the scab produced by the blistering peels off, the horn will probably grow solidly downwards. Blistering should be kept up till such a condition is obtained. In this case as in almost every case of sand crack, the horse should be kept as quiet as possible. When the horn is divided at the coronet it will take five or six months for it to grow fairly down should the horse be used even for ordinary work. When the horn has grown an inch from the coronet the horse may be turned out. He should be furnished with a bar shoe only when the inflammatory symptoms have abated. Systematic oiling with whale or seal oil, having perhaps sulphur or spirits of tar in addition, does much to give a better quality of hair to the legs an a less brittle horn on the hoof.

BROKEN WIND A DISEASE IN FARM HORSES THAT CAN BE VERY READILY PREVENTED

In the late summer and fall season when crops are ripening, or in the process of reaping, the horse is not grudged his feed. Probably he gets a certain amount of freedom on the pastures, and is also liberally supplied with feed from the abundance which the harvest season brings. He is toil worn and hungry all the time. Average horsemen do not probably know that this condition gives rise to broken winded horses. All horsemen who understand their business are on their guard at all times to keep their teams in the fittest condition to do the greatest amount of labor, and are more so at this season of plenty feed and busy time.

How Broken Wind Occurs

Suppose a horse to be a gross feeder, and to have filled his stomach with hay or any feed that occupies a great bulk, and contains little nourishment, the lungs are squeezed into a less than the natural compass. Let the horse be suddenly put to heavy work; more blood must be purified, and in the violent effort to accomplish this, some of the lung cells give way. Broken winded horses are not often found on the race track, for although every exertion of speed is required from them, their food lies in small compass, and the stomach is not distended, the lungs have room to play, and care is

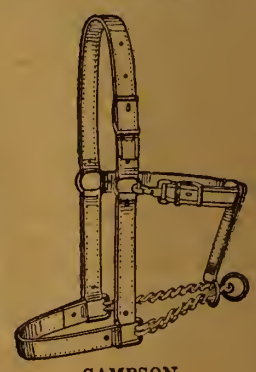
Your Horse Can't Break This Halter

We assume the full responsibility by attaching our guarantee tag to this Griffith Sampson Halter. This means that if it breaks within a year from date of purchase we will repair it, or send you a new halter absolutely free of charge.

There's strength in every strap and stitch of the Sampson. See that chain chin draw? That's electric welded steel chain—it grips the horse under the jaw when he pulls and he soon yields to its strength.



SAMPSON

Griffith Guaranteed Halters

Our guarantee tag is attached to all our guaranteed halters. Isn't that a worth while consideration when buying your next halter? Price of Sampson $2.50 (in the West $2.75). If your dealer can't supply you send direct to us giving dealer's name.

Send for free booklet. Shows a halter for every purpose—at a price to suit your purse.

G. L. Griffith & Son 64 Waterloo St., Stratford, Ont. 53

taken that their exertion shall be required when the stomach is empty.

It is among farmers' horses that the broken winded horse is more apt to be found because that on which he is fed is bulky, and too often there is little regularity in the management or work of the teams; and because after many an hour's fasting the horses are often suffered to gorge themselves with bulky food; and then, with the stomach pressing upon the lungs and almost impeding ordinary respiration, they are put again to work, and sometimes to that which requires considerable exertion.

Brokenwind disease in horses depends as much upon the cramped state of the lungs, from an overgorged stomach in the ordinary state of the animal, as on the effects of over-exertion.

It often happens in the idle season in summer that work horses are put on to pastures to pick up a living for themselves. These pastures are often of poor quality, and in order that the horse gets the proper amount of nutriment he has to eat large quantities, and his stomach is thus pressing continually on his lungs. Horses have often come in from grass broken-winded that went on perfectly sound.

Sometimes the distension of the stomach is caused by the generation of gases, by the use of musty hay, damp or sprouting oats, or stale green forage as a horse feed. A horse suddenly put to excessive exertion after a stomach full of water is liable to suffer from indigestion. This causes the nerves of the stomach to get out of order, and their extensions which ramify through the lungs are liable to become deranged and in some cases paralyzed. The air cells are no longer able to contract upon and expel the air, which at each inspiration enters the cells as usual. Hence a larger portion than natural of the air remains in the cells, even after the muscles have performed their duties in the ordinary course of expiration. In order to expel it, the animal is then obliged to bring into play the abdominal muscles as auxiliaries. Hence arises the prominent sign of broken wind, namely, a double action of the flanks.

Curing Broken Wind

Many inquiries reach this office relative to a cure for this disease, but when broken wind has become chronic whether it has arisen from inflammatory attacks on the lungs or from indigestion, the disease is obviously incurable, and active treatment is worse than useless. Prevention is the only measure to adopt. The symptom of flatulence, which is present in every broken-winded horse, shows pretty clearly that in the great majority of cases the disease is due to disordered state of digestive organs rather than to previous disease of the lungs. There is reason to hope that removal of the causes and reversal of the conditions, which have induced the malady, may check its progress, but little hope can be held out for the riddance of the disease. The food of the animal should consist of much nutriment condensed into small bulk; the quantity of oats should be increased and that of hay proportionally diminished; the bowels should be gently relaxed by the frequent use of mashes; the water should be given sparingly through the day, although at night the thirst of the animal should be fully satisfied; and exercise should never be taken when the stomach is full. These simple measures will afford great relief to the broken-winded horse. With judicious management a horse even with confirmed broken wind, though he will never become sound, may remain for years available for slow work. Carrots, turnips or mangels are very useful to the broken-winded horse as they contain much nutriment, considerable moisture, are easy of digestion, and soon pass out of the stomach. The roots when chopped and mixed with the oats and a little molasses added make a good diet. The disease has a hereditary tendency and any animal showing signs of liability towards it should never be chosen for breeding stock.

PRACTICAL METHOD CARING FOR HARNESS

Please give me a formula or directions on how to oil and brighten up a used harness. It is in first class repair but needs to be made better in general appearance. W. C. C.

The book entitled "Farm Knowledge" gives the following excellent discussion of the care of harnesses:

"At the outset, it should be said that a harness cannot be properly cared for unless one has a suitable place in which to hang it. In damp stables it molds quickly. The presence of mold indicates that moisture is taking the place of the oil, upon which the life of the leather depends. A harness should not be stored where the ammonia from the manure can reach it. However, in regularly cleaned, airy workhorse stable, most of us prefer to have the harness hung on a hook back of each horse; or by means of a rope and pulley; or by means of a rope the way on the post at the rear of the stall partition. In stables where a number of teamsters are employed too much time is wasted in going to and from a central harness room; such a room should be provided, however, for the storing of supplies and extra sets of harness. In this room should be a bench and materials for making small repairs. Valuable harness should be kept in tight cases in a room wheer there is some artificial heat.

"At least twice a year all work harness should be entirely taken apart (particular attention being paid to the straps at the buckles) and then cleaned and oiled. At tehse times, all needed repairs should be made. In cleaning harness, as little water as possible should be used; warm, soft water is best, but hard water may be used if a handful or two of salsoda is added to each tubful. Some harness is so dirty that sponging alone will not remove the dirt; in this case it should be soaked for fifteen minutes, then scrubbed with soap and a brush, rinsed, wiped with rag or chamois, and hung on a wooden horse to dry in a warm place but away from the stove. As soon as it is dry, apply neat's-foot oil (diluted one-half with a good standard harness oil, or about one-fourth with kerosene) with a rag or a piece of sponge. Several are generally needed, and it will pay to rub it well into the leather with the hands. Neat's-foot oil, when used straight, is likely to cause the work harness to become too stretchy. It may be made black by adding a tablespoonful of lamp black per pint. When the leather shows up very red after washing, give it a coat of edge blacking before oiling. Under no circumstances is it advisable to use a drying oil, such as linseed oil. Low grade vaseline is useful for smearing over a harness which is to be stored for a considerable length of time. After the oil has soaked in, sponge the straps with a good grade of castile soap. The frequent sponging over of a harness and the use of any of the good dressings are to be recommended.

"When a brilliant black finish to the harness is desired, it becomes necessary to use some one of the standard harness "compositions," which are quite similar to the best pastes used for polishing black shoes. There is, in fact, no objection to using shoe polish, except fo rthe extra expense entailed in purchasing it in small boxes at retail stores. The paste should be evenly applied to the harness with a dauber, then polished with an ordinary blackin gbrush, and finally with a flannel rag.

"For cleaning the metal mountings one may use most any of the liquid or paste brands of metal polish on the market. We find the paste to be more economical because it does not evaporate nearly as readily as do the liquid polishes. Steel bits are cleaned by washing with soap and water, then smearing over with a cake of soap and polishing with silver sand. The soap film makes the sand stick. The fingers are of most service in rubbing the sand on the bits; a soft pin estick can be used n parts too small for the fingers. After sanding, rinse the bit, dry with a cloth, and burnish with a small steel burnisher. Forged steel bits are the strongest and also the best looking if they are kept clean. Careful drying and wiping with an oily rag after using will prevent their rusting."

You wouldn't play a game of any kind without determining who was the winner when it was finished, would you? Farming without keeping records is the same thing except that you are liable to wake up some morning and find that you have lost the game when you had thought you were winning.

EGG LAYING CONTESTS

(J. A. Clark, B.S.A., Supt. Experimental Station, Charlottetown)

It is now recognized that Egg Laying Competitions have been one of the most compelling forces in the recent very rapid development of the poultry industry and now that greater production is so essential to our national reconstruction work, it is natural to turn to the some means for added impetus and inspiration.

The beginning was small. Mr. Holmes Tarn, founder of the Utility Poultry Club of England, arranged for the first Egg Laying Commpetition in 1897. There were seven entries of four pullets each, and it ran for only sixteen weeks; twenty-eight birds in the first competition. Last year there were in competition over three thousand birds. These were in different parts of the United Kingdom, the British Dominions and the United States. Canada held her first Dominion Contest at Charlottetown, P. E. Island in 1918-19, with such success that this year Dominion Contests will start, November 1st, at six points, and an International Contest will be carried on at Ottawa.

The benefits of these competitions fall into two categories: First, to the owner of the competing pens of birds, and, second, to the industry as a whole. The benefit to the contestant, which has been the impelling force that has sustained and increased the entries from year to year, is the advertising medium it provides for his stock. There may be valuable prizes offered in the competition, but these are small compared with the value that each and every competitor receives in the accurate statements furnished about the individual birds and their Record of Performance. This method of public and authorative comparison gives the strains of our utility poultry their place and standing better even than the show pen does for the breeder of exhibition strains.

The second benefit, however, is much broader and far more important to the Poultry Industry and the public as a whole. Laying competitions are leading the way in progress for all poutry keepers, big and small; not only in regard to the actual material results secured from individuals or strains, but as an educational force, which has already revolutionized poultry keeping, and placed it on a sound business basis.

Contests set up a working standard. They provide incentive and stimulus to thousands. There is no Standard of Perfection yet attained in utlity stock. Everyone knows that with better methods of feedng, housing and general management, the possibilities of our barnyard throughout the country are so great that they can only be guessed at. The official Record of Performance will be a new ladder to enable breeders to climb to new heights of production not deemed possible before.

Today we are trying out systems of culling flocks. The object test, with its acreful observation and trap nests, is the only reliable answer to these and similar questions.

After having looked into the working of these competitions here and in England, I would like to add a few words in addition to the benefits mentioned, with regard to the dangers and abuses that are involved. The danger that is always present in competitions, is to work for mere number of eggs produced, disregarding the size, marketable qualities and cost of production. The hen producing the second highest number of eggs at a contest last year was disqualified, and did not secure even third place. A pen owned by a very noted breeder at the International Egg Laying Contest at Dodnash Priory, Suffolk, England, was disqualified because his hens had averaged over 20 small eggs each, during the contest. The hen laying the greatest number of eggs at the Dominion Contest at Charlottetown, did not secure any prizes as a pen, owing to its average eggs being only 22 1/3 ozs. in weight per dozen, while twelve other pens averaged 24 ozs. per dozen, or over. The winning pen was 171 eggs short, but the average weight of its eggs was 25½ ozs. per dozen. One P. E. Island pen averager 26 ozs. per doben for the whole period.

Another danger to be avoided is the sacrificing vigor, stamina and constitutional fitness. The substituting of spare birds for those that die during a contest is open to criticism, particularly when these birds continue the records of those that die. Many contests now do not allow any substitution. Some managements say that birds that do not have vitality enough to live the year out, are not worthy of winning. Contests should be conducted under condition as nearly normal as possible. Conditions, whether of housing or feeding, should be limited to those generall obtainable by the ordinary poultry keeper. These tests and trials should show what is possible under good comemrcial conditions. The contestants are entitled to generous prizes and all the other benfits, as they give up all eggs from ten of their best hens for one year; but the conditions must be framed and the methods adapted that will benefit the whole industry, and through the consumers, benefit the whole nation.

P. E. ISLAND EGG LAYING CONTEST, 1918-1919.—FINAL AWARDS

The first Dominion Egg Laying Contest closed at Charlottetown on Sept. 30, 1919.

The premier prize was awarded to the Barred Plymouth Rock hen No.

41, owned by T. J. Adamson, Rougemont, Quebec. She laid 227 eggs in eleven months. The size and weight of the eggs were considered in making this award of a coal-burning, self-regulating Candee Colony Brooder, donated by the Candee Incubator and Brooder Company, valued at $60.00. This hen also won, for this year, a handsome silver cup, valued at $50.00 donated by the Caldwell Feed and Cereal Company. The cup has to be won twice out of three contests.

The second best record made by an individual hen was secured by the Barred Plymouth Rock hen No. 195, owned by W. E. B. Tait, oDrchester, N. B. This hen laid 212 eggs and won out over hen No. 200 in the same pen, which laid 225 eggs, Many of these eggs, howecer, did not come up to standard requirements, and No. 195 was awarded one root cutter valued at $10.00, and $5.00 in cash.

The third best indiviual hecord was male by the White Leghorn hen No. 82, owned by C. B. Chapman, Amherst. N. S. This hen laid 201 eggs during the contest, but they were so large and uniform that she also won over hen No. 200 mentioned above.

The pen in the Heavy Class that gave the greatest revenue from sale of eggs over cost of feed, was ofned by H. H. Dowton, Toronto, Ont. The value of the 1175 eggs laid by these Rhode Island Reds during the eleven months was $45.26, their feed cost $24.14, leaving a profit over cost of feed, of $21.12. They won the pen of aBrred Plymouth Rock pullets and a pedigreed cockerel, donated by the Charlottetown Experimental Station, valued at $30.00.

The pen in the Heavy Class showing the second highest revenue from sale of eggs over cost of feed for 11 months, was owned by Thos. J. Adamson, Rougemont, Que. The value of the 1286 eggs laid by his Barred Plymouth Rocks during the constest was $44.81. Their feed cost $24.11; the profit from this pen being $27.70. They were awarded a cash prize of $10.00.

The pen in the Light Class that gave the greatest revenue from sale of eggs over cost of feed was owned by C. B. Chapman. The value of the 1148 eggs laid by these White Leghorns during the contest was $40.08; their feed cost $21.48; the profit over the cost of their feed was $18.60. They won the pen of White Leghorns, consisting of 8 pullets and a pedigreed cockerel, donated by the Charlottetown Experimental Station, valued at $25.00.

The pen winning the second place in the Light Class was owned by W. J. Pickard, Wetaskiwin, Alta. The 1047 eggs laid by his pen brought $36.25; the feed cost $19.45. leaving a profit of $16.80 over cost of feed for the 11 months. They were awarded a $10.00 cash prize.

Rev. J. J. McDonald, Kinkora, P.E.I., won the $10.00 cash prize for the P. E. Island pen showing the largest revenue during the contest His pen of Whitè Leghorns laid 1095 eggs, worth $37.30. their feed cost $21.54, showing a profit of $15.76.

A feed hopper was awarded to W. J. Pickard, whose pen of hens completed the contest without any one of the hens losing a day through broodiness.

The Rhode Island Red hen No. 52, owned by H. H. Dowton, won the Cycle Hatcher, valued at $10.00, awarded to the hen laying the most uniform eggs, over 24 ozs. per doz. in weight. His pen throughout the contest averaged 25½ ozs. per dozen.

A great deal of valuable information was secured during this contest. Complete summaries of the production of each hen, together with itemized statements of the cost of feeding each pen, has been supplied to the contestants, and furtehr information will be supplied to the press from time to time.—J. A. Clark, Supt.

Stanfield's "Red Label" Underwear

To men who work outdoors in Canada, the question of winter underwear is one of great importance. The answer lies in

Stanfield's "Red Label" Underwear

which is made of the best grade wool obtainable. It fits perfectly, giving comfort, freedom, and warmth, and is the best underwear for outdoor work. All good dealers sell it.

We also make underwear of lighter weights, for both indoor and outdoor work. Send for free sample book.

THE NEW WRAP

"My, but it's pretty!" exclaimed Mrs. Plagge, as she fingered her neighbor's new wrap. "Honest, Mrs. Brown, it's just a treat for anybody's eyes just to see you coming down the street wearing it! If I could ever look so stylish! I need one something awful!"

"Oh, well, just now 'tain't considered nothing to be wearing on out of style wrap with bonds to pay for and high prices and all," said Mrs. Brown kindly. "If I hadn't been in rags I mightn't have got this."

"'Tain't the money," replied Mrs. Plagge. "I got it all saved up—$15!"

"Fifteen dollars!" exclaimed Mrs. Brown.

"I guess maybe yours cost a lot more than that," admitted Mrs. Plagge. "You can't fool me on goods. and, anyhow, there's something about a high cost wrap——"

"But there's lots of cheaper ones that look real goo,d" interposed Mrs. Brown. "They look so pretty you can't scarce tell the difference."

"Is there?" said Mrs. Plagge eagerly. "Only I couldn't get one of those loose stylish things on account of John. He believes in plain clothes. That coat I got three years ago had big buttons on it for trimming, and John made me take them off."

"If you was to die—excuse me for mentioning it, but men are men, you know—if you was to dies I'd bet this new cape it wouldn't be any plain dresser Mr. Plagge'd have his eye on for a second wife."

"Well, anyhow, what can I do when he makes such a fuss so that I have to wear always out of style clothes? And it makes me sick to buy anything even when I want it so bad because he picks to pieces anything I bring home."

"I tell you what, Mrs. Plagge. You take your husband along and have him help you pick out your wrap."

"John in a woman's wear department ! He'd—why, I couldn't even imagine me asking John, he'd refuse that flat."

"Don't ask. Just take him. Meet him at the office door and tell him he's got to go along with you. May- n't want to be butting in, -but maybe if you took the high hand just a little you could be wearing more what you want. You get Mr. Plagge down there and let a saleslady begin to talk to him and you can't tell what might happen."

At first the idea of asking John to go with her to a woman's wear department horrified Mrs. Plagge. What mightn't he make her get! The detested clothes he made her wear—never a flower in her hat, nor a piece of silk or a bit of jewelry about her person! She stayed at home so much that she was now counted out of almast everything. She hadn't even visited her mother for three years. But that seemed to suit John. A woman should stay at home and take care of the house. That was her mission in life. If she hadn't gewgaws she would be gadding. But yet Mrs. Brown's suggesstion persisted. She who managed her own husband so capably and so happily might know a little about even so different a husband as John. Things couldn't be much worse and they might possibly be a little better. It was Saturday and she was waiting outside his office door.

"What's the matter, Etta?" he cried in astonishment when he saw her.

"I've got to get a new wrap, John," said Etta, in as matterof-fact a tone as she could muster. "You didn't like my last one and made me change it, so I guess about everything I ever did buy I had to change, because you didn't like it. I might as well get what's right in the beginning, since we pay the money for it. I've been thinking that you should help me pick out something. Then you'll be satisfied and it won't make such a lot of work for me."

To her sirprise Etta saw that John was not displeased.

"Well, I don't know but maybe I could," he assented. "You got the money?"

"Yes. I've been saving it here and there. I got $15."

"Well, you can get one for maybe five or anyhow ten," replied John. "I'll go and eat some lunch and then you can meet me over at the People's store."

Etta's heart turned to lead. Now she wished that she had not taken her neighbor's advice . She at least would have spent the whole of her savings on a wrap and got something not altogether impossible, while John would hunt out the cheapest thing he could find, no matter how ancient it might be.

"We'll go down to the basement," said John.

Etta expected that. She never did go above the basement to make any of her purchases.

"Once my sister got a cloak here for $2," he said cheerfully.

"Oh, John——!" began Etta, hanging back. If she could only plead sickness—anything to get him to go home now and then some day she would come down by herself. But John was already on his way to the elevator, so she followed meekly behind him. He had taken the business of buying her a wrap into his own hands and she might as well be passive.

"Show us some cloaks," he dictated to the salesgirl who presented herself before him. "None of the buzz saw things nor ruffles nor buckles—something plain.

"I said plain! That's not plain!" protsted John as she threw a wrap over Etta's slim shoulders. "Look at them rows of buttons and that braid! How much is it?"

"Twenty-seven fifty," replied the girl.

"That is too much and no need for us to pay it since we've no call to take all that fanciness. What do you call that, anyhow? We want a cloak, not some foolishness."

"This is a dolman," explained the girl. "It's mostly dolmans or some sort of cape effect, this year. If you're going to get a new wrap you might as well get something stylish."

"That's what we don't want is something stylish!" shouted John. We want something plain!"

"Oh, John, let it go," urged Etta, miserably. "I'll get on somehow without a wrap!"

Anything was preferable to this.

"No, now we got started we're going to buy you a cloak . If i don't stay with you how do I know you won't get some of these crazy stylish things"

The salesgirl returned bearing several more wraps.

"Maybe you got something at $3 or $4—if it's a few years old that don't matter," said John.

"We haven't anything under $18 in coats," said the girl, patiently. "Here's one——"

"Look at those buckles! You call that plain?" shouted John. "And those here others—all buttons and braid and such."

"Well, we haven't a thing that's absolutely plain down here," returned the girl, her eyes on Etta's wistful, humiliated face. "But you can find perfectly plain garments up on the third floor.

"Come on, Etta," commanded John, while Etta lingered behind to thank the girl softly.

"Here," said John, approaching a dignified gray-haired woman on the third floor. "You got on plain clothes yourself. That's what I want for my wife is a cloak."

The woman hid a smile. She was well aware that this possible customer would have gasped had she told him the price of the "plain clothes" she wore. She brought wraps, exquisitely tailored garments, and laid them before him. Etta gazed at them rapturously. Never had she seen anything so beautiful.

"There!" exulted John. "Didn't you always tell me you couldn't find anything plain and here there are stacks of them. Why didn't you get such when you could? It takes a man to do buying!"

The woman had been studying Etta's face and figure. Already she knew the garment for her and slipped it on.

"It's what we call a coat cape," she explained. "She can wear it early and late because it can be made high in the neck by means of this throw. There, doesn't she look beautiful in it? She has the shoulders to carry it well."

John's mouth literally fell open as he looked at the stylish, youthful figure before hiw. How could she look so in plain clothes? What was wrong with the garment?

"I guess it's that lining. It's spotted with white. Maybe that's why it looks stylish."

"What good taste!' 'complimented the saleslady. "You admire the plain tailored garment and then you want just this bit in the lining to relieve the black. You certanly do know the right thing in women's clothes!"

"Well, we take it," said John. "I always told my wife I could pick out something plain . How much is it? 'Bout ten dollars?"

"This garment is forty-five dollars."

"Without none of that braid nor buttons nor nothing?"

"But you have the hand tailoring. That's what you wanted."

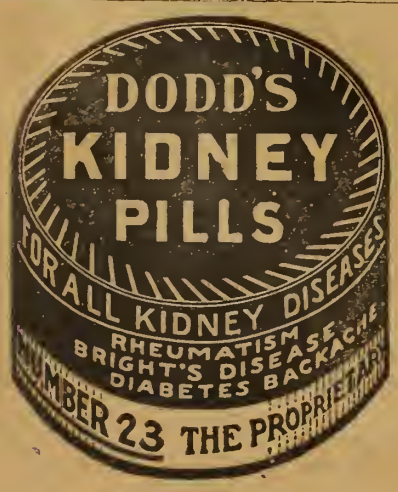
"Sure," agreed John. "We take it."

"But John," began Etta unbelieving.

He hushed her with a look. Not before this lady was she going to shame him. He put his hand into his pocket and drew out a roll of bills from which he peeled off the required amount.

"A little black hat with just a dash of white in it would look charming with that wrap," suggested the saleslady.

"Well, we might as well die for a sheep as a lamb," said John. "I guess maybe, if I could pick out a plain coat cape I could pick out a plain hat, too. And then now you got the clothes you better run to your mamma's for a lit-



MAGIC BAKING POWDER

Contains no alum

We unhesitatingly recommend Magic Baking Powder as being the best and purest baking powder possible to produce. It possesses elements of food that have to do the building up of brain and nerve matter and is absolutely free from alum or other injurious substitutes.

Use only three level teaspoonfuls for five cups

RED ROSE TEA "is good tea"

tle visit and show them sisters that you can be as good looking in the kind of clothes I pick out for you to wear as they can in their clothes with so much fanciness. Maybe I come for Sunday, too, and then we go to church like before we were married, and then they can all see you ain't got it so bad when you look younger and better than you did six years ago.".

"Oh, John!" cried Etta.

PLANNING CHRISTMAS AHEAD

Begin now to prepare for Christmas and to avoid the disagreeable experieuce of trying to make your butter-and-egg money pay for gifts at the store—gifts as unsuitable for you to give as for your friends to receive. Almost every farm has its little flower garden. Gather the seeds, put them into envelopes, mark and tie with holly ribbons. Make a little packet of several envelopes and, if you wish to add a little personal touch, write floral quotations on each one.

Potted plants in bloom, hyacinths, Chinese lilies, geraniums, narcissus—are the sweetest messengers to take your holiday greeting to your neighbors, and they will repeat it daily and hourly spelling it out in beauty and fragrance.

Small baskets of winter vegetables, or apples, boxes of home-made sausage, jugs of cider tied with festive red and green ribbons, are all farm presents that go to the spot in a way that the gayest and most gold-leafed gift-books never reach.

Canned fruit, jelly and jam, and home-made candy, pop-corn balls, home-made crackajack are gifts that need not cost much. Let the children help crack the nuts for candy and cake making. A box of small iced nut cake or nut cookies, prettily wrapped and tied, is a present you may be glad to make and glad to give, for you may be sure that it will be appreciated and very much enjoyed.

Save the feathers from dry-picked poultry, and, instead of using naptime and booktime to embroider sofa-pillow covers, buy at your leisure, pretty suitable remnants for covers. Make up your pillows and have the satisfaction of giving a substantial present at small cost.

A most useful present I received was made of Turkey-red cotton of heavy quality. A piece of stiff paper seven by eight inches is covered with the cotton. In the lower left-hand corner a doubled piece of the cloth is chain-stitched on with black linen thread or floss, to hold large-eyed needles. Above, to the right, is a small pocket, also chain-stitched for an aluminum thimble, and in the upper left-hand corner is a spool of white linen-finish cotton thread, coarse enough to be strong, attached by a strip of black tape. The flap that covers this useful collection is decorated with a turkey outlined in black.

My Gift Shelf

From every batch of jellies, jams, preserves, grape juice, and pickles, I set away at least one tumbler or bottle on my Christmas shelf. These make very dainty and acceptable gifts. The amount, distributed throughout the season, is hardly missed and the labor involved is very little.

When apples are harvested I pick out a bushel or more of choice ones, polish them until they shine and wrap each one separately. Nuts, pop corn, and taffy candy, with walnut meats mixed in, also figure prominently in my list of gifts.

Knit and crotchet lace, collars and doilies, baskets of fruit, vegetables and even fresh eggs, each one wrapped in a bit of holly paper and then packed in a dainty box, go to make my friends happy at Christmas.

One Christmas I made a gift to a little bride who lived in a tiny city flat. She had taught school in our neighborhood the year before and we had learned to love her. I wanted to send her some of the good things from our farm. I took a mammoth pumpkin, cut off the stem end for a lid and scooped out the seed and pith. Then I lined the pumpkin with waxed paper and filled it with goodies. A small chicken dressed and placed on a bed of parsley; a glass each of chopped pickles, preserves and jelly; a square of fruit cake, and a tiny plum pudding, each well wrapped in waxed paper; a glass of cabbage salad; a stalk of celery; two sweet potatoes; a tiny mince pie and some homemade candy. I put more waxed paper on top and the lid was held in place with toothpicks. Next I wrapped the pumpkin in holly paper, tied it with red and green ribbon, packed it in excelsior in a basket and sent it by express. If one plans ahead this way, Christmas will cease to be a burden and a bugaboo.

PUTTING AWAY SUMMER CLOTHES

Since of late years our climate has become so variable, a great many do not pack away summer clothes until about the end of November. Then a time comes when there is a little leisure. Fruit and vegetables are all in place, fall house cleaning is done, and there is time to "fuss" over the packing as long as one chooses.

And, right here, it pays to take time over the work . It is necessary to have things come out looking well next spring, and how can they, if tumbled into boxes anyway and jammemd away anywhere during four or five months of winter.

Of course cedar chests are the ideal for packing things in, especlally for summer when moths run riot. But in winter it does not so much matter. Plenty of boxes and trunks, and a cold attic or other room for storage will supply all necessaries. If each person in the family can have a box for themselves, why all the better; just so much confusion can be saved when this or that garment is needed in the spring. It will be better still if each person can have two boxes, one for fine articles, the other for coarser articles, shoes, slippers, etc. And really boxes do not cost very much. Good stout ones with lids can be bought from store keepers for a trifle.

So now the packing itself: in the first place it is absolutely advisable to have everything clean that is put away; and be sure not to lay away anything that has been starched. Wash all the starch out and dry thoroughly, otherwise the garment will turn yellow.

It is advisable to mend any rips and patch any holes that may have appeared . There is time to do that now, and if there is one thing that is exasperating it is to take out garments in the spring, needed at once for wearing, and find them quite unfit to put on, a button off here, a hole there, a hem frayed, and so on.

If there are any shirt waists that are too much worn to do duty as shirt waists next summer, keep them out and make them into corset covers. If they are just a little worn about the neck, from wearing stiff colllars, cut off the neck band, mark scallops on the edge, butonhole with floss, and work any little dot or pattern you choose in the scallops. Make the sleeves to match—and presto! a new shirt waist.

If there are any children's dresses that will need lengthening in spring, do this also before packing the dress away. You can make a very good guess at the length and so save time in April and May when house cleaning and gardening are both on with a rush.

Fold all garments, do not roll them —and place them flat in the boxes. It is surprising to see how much even a small box will hold. Summer suits and coats should not be packed away; they should be hung up in out-of-the-way places, on coat and skirt hangers, the coat hangers should be padded to prevent wrinkling of the coat. Brush out every bit of dust from the suit and remove the spots, slip the coat on the hanger, stuff the sleeves with tissue paper, and put a packing of paper in the front of the coat, buttoning the latter in place. If the place where the suit is to be hung is at all dusty, slip a large bag made of five-cent factory cotton over the whole.

Fancy summer dresses should also be hung up in the same way. If it is absolutely necessary to pack suits or dresses use plenty of tissue paper for sleeves and soft rolls of it for the folds of the skit, etc. This will prevent sharp creases. Lay the coat with

THE AFTER EFFECTS OF THE "FLU"

Has Left Many Weak Hearts.

This terrible scourge has left in its train weak hearts, shattered nerves, and a general run-down condition of the system.

Thousands of people, throughout Canada, are now needing the timely use of Milburn's Heart and Nerve Pills to counteract the effects of this trouble which a short time ago swept our country.

Mrs. C. C. Palmer, Keppel, Sask., writes:—"I wish to inform you of the great good Milburn's Heart and Nerve Pills did for me. After a bad attack of the "Spanish Influenza," my heart and nerves were left in a very bad condition. I got two boxes of your pills and I must say they are the best I ever used, and I have taken a great many different kinds. I will always keep Heart and Nerve Pills in the house."

Milburn's Heart and Nerve Pills are 50c. a box. For sale by all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

the front on top and button it up over the padding of paper.

Never pack white or light colored materials with white tissue paper as owing to some chemical used in bleaching it, it is likely to turn them yellow. Use blue tissue paper if possible.

Shoes never should be put away just as they are, if one has not shoe trees for them, one can at least stuff them with paper in so tightly that there is no possibility of them getting out of shape and creasing.

Hats too may be kept much more presentable if placed in their boxes on a pad of some sort that will keep the crown from sagging. An inverted strawberry box padded with paper is good.

Perhaps these little precautions do not seem important, but it is only necessary to try them once to be convinced of their advisability.

Hamilton Veteran Tells His Friends

THAT DODD'S KIDNEY PILLS ARE THE REMEDY FOR KIDNEY ILLS

Mr. S. Hodges, Seventy Years Old, but Still Young, Tells Why He Knows Dodd's Kidney Pills Are Good.

Hamilton, Ont., Nov. 8th—(Special) Convinced that Dodd's Kidney Pills are a sovereign remedy for kidney [illegible]lges, who lives at 68 [illegible]'s city, is recommending them to all his friends.

"I suffered from kidney disease for about four months," Mr. Hodges says. "It started from a cold, but I rapidly got worse, and cramps in the muscles, headache, heart flutterings and rheumatism were soon added to my troubles.

"My appetite was fitful and I felt heavy and sleepy after meals. I was very irritable and I perspired from the least exertion; I was often dizzy; I suffered from shortness of breath and it was difficult to collect my thoughts."

Mr. Hodges, who is a painter by trade, and seventy years of age, shows the benefit got from using Dodd's Kidney Pills. He only took two boxes, but with such good results that he says: "I can recommend them to all who suffer from kidney trouble."

Ask your neighbors about Dodd's Kidney Pills.

SEVENTH ANNUAL CONVENTION OF NEW BRUNSWICK WOMEN'S INSTITUTES

(Continued from page 88)

brighter outlook for little children than they could ever receive in the cramped life of an Institution.

The meeting was then adjourned and the delegates and visitors numbering over a hundred, hastened to participate of the generous hospitality of Mrs. W. E. Foster, in a most delicious luncheon given by her at the Manor House. Mrs. Foster received her guests, and the whole ground floor of the Manor House, made very pleasing to the eye with its daintily appointed tables was given over to their pleasure. There was a lack of formality that put every one at their ease, and added to the real enjoyment of the occasion.

Miss McCain and Mrs. Lawlor, in behalf of all present, publicly expressed their sincere thanks to Mrs. Foster —thanks which we are sure, was not only expressed in appreciation of the danity luncheon served, but more especially for the real interest in the Women's Institutes, which must have prompted such generous courtesy—an interest which was also clearly manifest in the address given by her husband, Premier Foster at the opening of the Convention.

Special cars then conveyed the guests to the Imperial Theatre, where the afternoon meeting was held.

The Hon. W. F. Roberts, M.D., Minister of Health, presided at this afternoon seesion and his introductory remarks were listened to wth much interest. He expressed great pleasure at being able to preside at such a meeting.

Speaking on Child Welfare, Hon. Dr. Roberts said we must conserve life, human life and its many branches is a vital subject. Women's Institutes stand for Home and all it represents. the Women's Institute work is of most importance. We have a fine country and fine people in that country, but we need awakening. There is too much drowsiness for lack of knowledge of the needs of humanity. He hoped that the present programme would be the means of starting a campaign in the interest of child welfare.

Miss Louise Anderson then favored the audience with a solo which was much appreciated.

Dr. Mabel Hanington, Medical School Inspector for St. John, then gave a bright, intelligent address on Medical Inspection Viewpoint.

Dr. Hanington told how the work in this line is being carried out in St. John, and the strong effort being put forth to militate against the spread of contagious disease from the school room. The Inspector visits each school at the beginning of the term and stands ready on call at any time.

There was need of each child, she said, having a thorough examination early in school life, preferably in Grade II., not only to determine physical needs, but also to find out all possible concerning those children who are handicapped from deriving the full benefits of education through being mentally backward. The new Health Act covered these needs very largely, and the needs are real; there ar 65.85 per cent in our schools which deviate from the normal, half of these may be from defective teeth, but this is no longer considered a minor trouble. Adenoid and tonsil cases are prevalent.

In St. John 1100 children were examined and some follow up work was done. It was found that 50 per cent of those taking action on advice have been remedied.

Dr. Hanington wished to impress on her audience the fact that mothers are not fully alive to the influence of late hours and tea on their children. Tea was too stimulating to the young brain. Would the Women's Institutes not make a stand for a reasonable bed hour and no tea for the children and work for free treatment for the teeth and eyes.

Dr. Hanington thought it would be well for the mothers to be present at the inspection of their children. Early steps, she urged, should be taken to make provision for those mentally deficient. Pro rata to population there are from 500 to 700 of these mentally defective in the Province of New Brunswick. We would not have so many criminals and delinquents in our community if our feeble minded received early attention. 65.80 of the delinquent girls now in Institutions are there due to feeble mindedness. Would not the Women's Institutes, she appealed, work for medical inspection to be carried out to its very best.

The violin solo by Mrs. T. J. Gunn, St. John, which followed this address was a real treat, and showed exceptional ability.

Mrs. J. C. Hanington, Chief Superintendent of the Victorian Order, Ottawa, was then introduced to the audience, and told of the organization of the Victorian Order 21 years ago and of the wonderful work accomplished by their nurses, who are all required to be graduate nurses, with the addi-

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

Read My FREE Offer:

To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten days' trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box 309 - - Windsor, Ontario

tional training of four months of bedside nursing, which gives them the necessary training to go down and get in touch with the homes of the people As Florence Nightingale has said: "It is the word after the deed that counts."

The Victorian Order cares for the child welfare up to the school age when medical inspection steps in. Their organization stood for "Square deal for kid."

Mrs. Hanington told of the great work to be done and spoke particularly of the help needed for the women of the prairies going down to death each day. She said the Victorian Order service was ready for the Province of New Brunswick, there being already a branch in St. John, Sackville and one to be established next week in Fredericton. They work under and with the authorities and Health Department, and hoped for the help of the Women's Institutes.

Women's Institutes are in such close connection with the Department of Agriculture, which brings the co-operation of the women and men to build up a great nation. Other things will be of no avail without love of God, Home and Country.

Mrs. Hanington's discourse was followed by an Exhibition Film, showing what was actually done in a small American city (Gadsden, Ala., Pop., 13,000), under the stimulus of a child welfare campaign, promoted by the United States Government.

An interesting feature of this afternoon's programme which should receive special mention, was the flag drill and songs put on by over 200 of the children of the Free Kindengarten of the city, under the direction if their teachers. An exhibition which reflected great credit on the training which they receive.

Wednesday, 8.00 p. m.

Mrs. S. J. Osman, Hillsboro, in the chair.

After the singing of "O Canada" and a selection by the orchestra, Mr. N. Savoie, B.S.A. Secretary of Agriculture for the Province of Quebec, addressed the meeting.

Mr. Savoie told of the work that is being carried out in Quebec through the "Home Making Clubs" and "Cercles des Fermiers.'

The "Cercles des Fermiers" were started in Quebec in 1915, during Agricultural Short Courses being held, and they now had 23 circles among the French of their Province, and the convents and academies had been induced to add home making, bee keeping, etc., to their curriculum by a grant of $300 from the Government.

The French women entered into it with all the enthusiasm of their race and with their good taste and womanly ability, have succeeded in making agriculture better understood.

Bee-keeping, poultry clubs, kitchen gardens were all taken up and summer short courses held, their Government helping generously at all times.

The arts of spinning, weaving cheese and bread making were taught, and a library installed of books of information along their lines of work. They have now 1047 members and their annual exhibition at the Provincial Fair is the center of attraction.

This, together with their annual feast and outdoor festival, brings their work before the public and renders the rural life more attractive to the young, provides profitable recreations and uplifts the moral life of the community. They are now forming a Provincial Council composed of a member from each "Cercles des Fermiers" and expect soon to have an official publication.

Mr. Savoie then addressed the French delegates in their own language for a few minutes in closing.

Mrs. Osman and Mrs. Hanington both thanked Mr. Savoie for his interesting address and spoke in high praise of the race to which he belongs.

Miss Valde Fenton, St. John, then gave a much appreciated vocal selection, after which Mrs. Muldrew spoke on "The Women of the Future."

Mrs. Muldrew told of being the first organizer of the "Mome Makers Clubs of Quebec" which work so harmoniously with the "Cercles des Fermiers", and told of the great work to be done by the women in these strange times following the war. We have only to watch others to see where we are trending, and we should all work for the common good. We have enough of greatness in each Province to provide against a mean, petty spirit with the other provinces.

The Winnipeg strike brought out the fact that you cannot hurt anyone body without hurting others. There is a great need of more coordination of work and not so much overlapping.

Life is more complex today and that is why the life of women has to be directed into definite channels, and one thing that is coming back to Canada is home-work.

Mrs Muldrew told of the vocational schools in the West and the splendid work through them that has been accomplished for the backward children. Alberta has proved the system a great success. 85 per cent of these backward children passing their final exams. successfully.

Mrs. Muldrew said to remember that the girls of today were the women of the future, and should be trained to make better wives and thriftier women, a better asset to the country. It is a fatal mistake not to train your girl for a life job whether she marries today or the next day. She never

STOP THAT PAIN

Why suffer—and in suffering neglect an ailment which may cost you your life? Pain is nature's method of warning you that the system is deranged—it is the signal for you to pause and take heed.

Backache, pains in the side, headache, rheumatism, lumbago, neuralgia, sciatica, etc., are due in almost every instance to Kidney trouble—to the uric acid and other impurities that are poisoning the blood through the failure of the Kidneys to act properly.

Gin Pills FOR THE KIDNEYS

WILL STOP THE PAIN

They have a wonderful action on the kidneys, soothing congestion, healing inflammation, rebuilding tissues, and enabling the delicate organs to resume their work of filtering the waste and poisons from the blood.

They contain no alcohol, just the beneficial properties of the Juniper Berry combined with seven other helpful diuretics and antiseptics.

Gin Pills are sold by all druggists and dealers at 50c a box,—with money back guarantee.

To prove their goodness we will send free on request a sample to enable you to judge their merits in relieving suffering humanity.

Do Not Neglect The Bad Cold OF TO-DAY

IT MAY BE SERIOUS TO-MORROW

May Develop into Bronchitis, Pneumonia and perhaps Consumption.

Miss Mary Prouse, R.R. No. 1, Cedardale, Ont., writes—"I had the Influenza in November last, and it left me with a terrible cough. I did not attend to it until it got so severe people warned me it was time to see about it. I went to the doctor and got some medicine. He told me it was a bad attack of bronchitis. I could not sleep, and would have to sit up nearly all night, it was so difficult for me to get my breath. The doctor's medicine did not seem to be helping me the least bit.

One of our neighbors came in one day, and told me about Dr. Wood's Norway Pine Syrup. I tried it and took two bottles. No person could believe how it helped me. I have recommended it to different people since, for I believe I have reasons for doing so.

Dr. Wood's Norway Pine Syrup has been on the market for the past 30 years, and stands out by itself as a remedy for all coughs and colds.

Be sure and get the real "Dr. Wood's" when you ask for it. Put up in a yellow wrapper; 3 pine trees the trade mark; price 25c. and 50c.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

THE RELATION OF COLORS TO THE INDIVIDUAL

"Choose the color that suits you, madam," saiys Paul Poiret. Unfortunately this advice is not always followed. If a manufacturer puts a new color upon the market this season—rhinocerous pink, perhaps—we hasten to procure some of the new color in order to adorn ourselves fashionably, regardless of the fact that our complexion may be pea-green. A wise woman, however, will study carefully the effect of the color against her complexion before choosing it for a gown. Bright blue will emphasize the shallow complexion of a person who is naturally sallow. The law of simultaneous explains why—a color reflects its complement. The complement of blue is orange. Tinge a sallow complexion with orange and it becomes more sallow. This knowledge is of the utmost importance to the woman who wishes to wear becoming colors.

Simplicity in Dress.—There is one kind of costume which is always pleasing and strikes a note of refinement in dress. This costume is one in which one color predominates. A woman all in white or in black usually achieves an air of distinction which she fails to achieve in a costume of many hues. This is especially true of clothes for the street. The garb of mourning carries with it the stamp of quiet elegance. This is true also of the colors blue, brown, green and violet in their more subdued hues. A string of beads, a knot of ribbon on the blouse, or a feather or flower in the hat may furnish all that is needed of a contrasting color for accent. Many women lose their individuality in their trappings . This danger usually lies in unintelligent use of many colors. That costume is most pleasing which stands forth as a unit, a perfect whole.

A predominating color throughout the entrie wardrobe not only unifies one's appearance but also enables one to dress more economically. The expense of buying accessories to harmonize with costumes of various hues is a very large item in the cost of the wardrobe.

Colors Appropriate for the Season—To appear in a bright yellow dress on a hot sumer day is a crime. There should be a law to prevent the infliction of such torture on an already perspiring public . A bright red dress is equally bad. If the cool colors, blue, green and violet ,are not becoming, it is possible to obtain very subdued intesities of the warm ones, red, orange and yellow.

Colors for Fat Women.—Color emphasizes line. To secure good lines is the fat woman's problem in dress. The general background for all life is neutral gray. To cloths one's self in pronounced color against such a background is to emphasize one's outline. Therefore the women who wish to conceal unattractive lines will resort to the gray or neutral hues. Bright colors and warm colors— red, orange, yellow—have the power of making objects appear larger than they really are. A word to the wise is sufficient.

Color and Texture.—When choosing colors, the texture of a fabric should be considered. Brilliant, hard colors should be avoided in a hard, wiry fabric. Soft silks, crepes, and thin materials which lend themselves to graceful folds have a tendency to make colors appear softer. In these materials stronger colors are permitted.

Transitions.—To oppose an unrelieved color against the face is apt to be trying except in rare instances of perfect complexions. Some soft, transparent stuff in white, cream or gray should be used to modify the transition. There are few, even among young girls, who can afford to omit this softening amalgam. It is an unfortunate mistake, frequently committed, to wear a dark dress without a collar to effect a shading between the dress and the skin.

Color for Types.—Every woman is an individual type. Broadly speaking however, women may be classed as blondes or brunettes. Red is for blondes and blue is for brunettes. Ther reverse of this rule was formerly thought true, but paintings by masters in art have proved the reverse. Brown, gold, yellow and cream-white are also brunette colors. A woman whose hair is auburn or red will find her colors among the browns, violets and lavenders. There are many women, however, who belong to the no-particular type. For them, choice of becoming color is a matter of experiment. An artist tries many colors on his palette before transferring them to canvas.

LET a woman ease your suffering. I want you to write, and let me tell you of ... method of home treatment, ... n days' free trial, post- ... it you in touch with ... Canada who will gladly tell what my method has done for them.

A MESSAGE TO WOMEN!!

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me today for free trial treatment.

Mrs. M. Summers, Box 309 Windsor, Ont.

Whether one always succeeds in finding the most becoming colors for her type may be a question. But no one needs to make herself silly or ridiculous by her choice. To be stared at is not always a compliment. Good taste is never characterized by gaudy display.

Effect of color on wearer.—It is claimed that color affects both the body and the mind of the wearer. Red is an exciting color . We are told that association with it will actually increase the number of heart beats. The cheerfulness of the Japanese as a nation may be due to the fact that they "swim in a sea of yelolw." Blue and green have a quiet, soothing effect. Dingy clothes make one feel dingy. A personality may be warped and spoiled by ugly clothing.

It is urged by some that color is secondary to line and form. Without entering into the argument, it may be safely said that there is no element in our sensuous nature which gives us greater or more varied pleasure than our ability to see color. In the light of these facts it becomes imperative for us to cultivate a refined color taste, not only for own pleasure and happiness, but also for that of the people with whom we associate.

HOW TO JUDGE POULTRY

Chickens.—Soft and smooth legs and feet, flexible breastbone, tender skin, lean in flesh and few or no hairs.

Fowl.—Hard and scaly legs and feet, hard breastbone, tough and thick skin, fat, especially about the intestines, many long hairs.

Fresh poultry should be firm and of a yellowish tinge and sweet odor with a fair amount of fat under the skin. A flabby bluish look denotes cold storage poultry.

The canny woman who adjusts her menu of the most seasonable supplies has poultry on her list for October. Of all the methods of cooking poultry roasted chicken is probably the most popular. It is also the most expensive way, although a bit of extravagance is warranted by the resulting succulent flesh with all its juicy tenderness coaxing the palate from beneath a cover of crackling goldenbrown crust.

Bake in a covered roasting-pan with a little water in the bottom compartment. Cooking will take from an hour to a half in a moderately hot oven.

Roast Chicken.—Make a stuffing of dried bread crumbs, which have been put through the food chopper, using the medium-fine grinder. Use about one cup of crumbs. Moisten with as much milk as the crumbs will absorb and season to taste with butter, about one tablespoon, half a teaspoon of salt, a little pepper, and sage or poultry dressing.

Put this stuffing into the dressed and well-washed bird by spoonfuls.

J. A. MARVEN, LTD.
BISCUIT MANUFACTURERS
MONCTON HALIFAX ST JOHN

First fill the crop region about two-thirds full and tie up the end of the skin over the neck. Next fill the body region in the same proportion. Sew up this opening or fasten it by sticking toothpicks across both flaps of skin and then lacing around the ends. Truss wings and legs close to the body by twine, or better still by two long skewers put through the body of the bird, one just beneath the legs, the other through the wings and breast. Tie the ends of the drumstick bones together and draw down by string to the tail. Continue the string to fasten around the skewers and legs. Cross the strings over the back and wind them around the wing skewer. Tie them over the back. If the chicken is very lean it will need to be covered with paste made of butter, salt, peper and our mixed. Southern cooks always use this "tendering paste."

The most economical way of serving poultry is the fricassee, especially if the cooking process is carried on in the fireless. For this method a good fowl, not too fat, should be selected.

Stewed or Fricassee Fowl.—Have the fowl dresed and cut at the market. Wash all the pieces carefully and wipe with a fresh food cloth. Put the pieces into a container and just cover them with water . Simmer for fifteen minutes and then transfer to the fireless cooker for five or six hours. If not tender at the end of that time reheat and cook again.

Three ways of serving fricassee fowl: 1. Thicken the gravy. Make dumplings or cook baking-powder biscuit, split them and serve meat and biscuit in the gravy. 2. Remove meat saute it and serve it thickened gravy. 3. Remove meat from bones and skin. Put it through the food-chopper. Clear the liquor in which the fowl was cooked and thicken it with gelatine, using one tablespoon of granulated gelatine to each pint of liquor. When the liquor begins to set stir it in the meat. Mold in deep narrow baking-pan and serve in slices cold.

BATHROOM AND FURNACE

The list of conviences in the housewife's department can be extended almost indefinitely or until they become luxuries. Along with the use of the elevated tank, the farmer may have a bathroom where all the household may have a refreshing bath after a hard day's work. Then there is the question of heating the house properly. A furnace, either hot air or hot water, may be put in at a moderate cost. If the farmer feeels that he can afford such a thing, he will find it a great saving in the end. In normal times he can purchase his fuel from the coal dealer cheaper than he can hire a man to cut wood. By putting in a furnace the farmer will find that all parts of the house can be warmed during the winter and made pleasant and healthy. Then, too, with a furnace, the fuel is kept in the cellar, thereby saving the housewife from dirt which must be cleaned up when two or more stoves are kept going during the winter.

Ginger Drop Cookies

1 cup fat.
1 cup sour milk.
3¼ cups flour.
½ teaspoon cloves.
1 teaspoon cinnamon.
3 eggs.
1 cup brown sugar.
1¼ teaspoons baking soda.
¾ cup molasses (very dark.)
Pinch of salt.

Cream sugar and fat. Add well-beaten eggs, then sour milk with soda in it, then molasses, then flour and spices. Drop by spoonfuls on tins and bake quickly. Makes four dozen cookies.

Mrs. H. H. B., Montana.

Just 1 Point— SATISFACTION

There is only *one* point in any agreement

between you and John Hallam Limited when you buy your furs by mail and that is: *you must be satisfied.*

Satisfaction must be yours—satisfaction in price—in quality—in appearance—in style—in wear.

When you buy furs you want them to wear well for a long, long time.

We secure the raw furs direct from the Trapper, select the most suitable, make them up into **Hallam Fur Coats or Sets** in the latest fashions, and sell them *direct to the wearer by mail.*

All under our direct supervision; this is why we *know* HALLAM FUR GARMENTS are *good*.

Hallam's GUARANTEED Furs "From Trapper to Wearer"

Then by our policy of selling direct from *Trapper to Wearer* you save all the middlemen's profits.

And how easy for you; simply look through HALLAM'S Fur Fashion Book, select the articles you think you like and send the order to us by mail. No time wasted—no noise. No waiting in a busy store; no bother and no urging by an anxious sales clerk. Then by return you receive your furs; the whole family can examine them in your own home without interference and at your leisure.

If you are not satisfied for any reason, simply send the goods back and we return your money in full at once, as this is our positive guarantee under which all HALLAM FUR GARMENTS are sold.

You cannot lose—be up to date.

Buy your Furs by Mail from Hallam

It is easier—more pleasant—and cheaper.

FRONT WHEEL ADJUSTMENT

J. G. H. writes: I have always thought that the two front wheels of a car should both point exactly straight ahead, along parallel lines, when the car is headed forward, but I am told they should point a little toward one another to give the best results. Why is this and how much should they point together?

Answer: When running the wheels should point as you thought they should but, in order to make them do so in practice it is found necessary to so adjust them that, when the car is standing they should point slightly together in the forward direction. This is because the effect of the road resistance which they overcome tends to

make them diverge slightly or "toe out" and any "spring" or looseness in the knuckles or in the connections of the cross rod may permit them to do so, and to wear the tire treads unduly. To counteract the effects of this tendency, the distance between the centers of the tire treads measured at the front should be made about 5-16 inch greater than the corresponding distance measured at the rear, in the same horizontal plane. In the cross rod connecting the two wheels is usually provided an adjustment by which its length can be altered and this wheel adjustment made correct.

LIFE OF V-TYPE ENGINES

H. F. writes: I am strongly tempted to buy a ——— car, but a number of apparently intelligent people have warned me against so doing, because this car carries a V engine, and this

— soon wears its cylind- l becomes unfit for service. your impression as to this?

Answer: Their claim is not well founded and is probably based upon the idea that the weight of the piston is an important factor in causing friction and wear. In the vertical engine, piston weight does not act upon the cylinder walls, but in the horizontal engine it does and also in the V type, to a less degree. However, the effect of piston weight amounts to nothing as compared with that of the wall pressure transmitted through the connecting rod and there is no practical difference in the rate of wear of a cylinder whether it is vertical, horizontal or inclined, provided all other conditions remain the same.

ADVANTAGES OF AUTOMATIC SPARK TIMING

P. asks: Is there any advantage in the form of ignition, in which the spark is regulated by an automatic device, over that in which the driver regulates it in the usual way?

Answer: Somewhat higher fuel economy and less strain upon the engine is obtainable with the automatic than with the manual method of spark timing. The automatic device simplifies the duties of the operator and doubtless is more correct in its action than any driver can be. It is not, however, capable of adjusting spark position to best meet extreme conditions and manual regulation is then requir-

ed, but, on the whole, we believe that it is a great help in obtaining good operative results. Different ignition systems, possessing varying electrical characteristics, differ widely as to the amount of spark regulation they require. Some require a very wide range, to insure the best results, and the automatic device is of great advantage with them. Others require very little change in timing and can be operated with good efficiency with almost a fixed setting though a very great range of engine speed. The automatic advance is of less value under such circumstances.

CRACKED BATTERY JAR

I. W. H. writes: One of the cells of my storage battery takes at least twice as much water to keep it filled as does either of the others. Why is this?

Answer: The probabilities are that

this jar is very slightly cracked, allowing liquid to seep out very slowly and not fast enough to make a noticeable mess. Its escape will, however, result in so great a reduction of electrolyte strength in this cell, as to interfere with the battery's operation. You better have a battery expert make an examination.

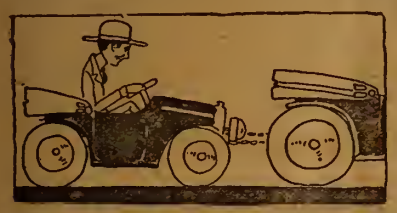
A LUCUBRATION ON LUBRICATION.—CONSISTENT LUBRICATION KEEPS CARS YOUNG

The greatest avoidable loss suffered by users of motor cars is that caused by their failure to keep all working parts continuously properly lubricated, and it is a colossal loss. It takes, roughly speaking, 50,000 to 100,000 miles of service to wear out a conscientiously lubricated car and a car with ideal lubrication would never wear out, because no two working parts would ever come in actual metaillic contact, for they would always be separater by a film of oil or grease, which would itself assume all friction. On the other hand, it requires only a few miles of service thoroughly to wear out some parts of a car, when their surfaces are devoid o flubricant, and only a very small mileage, performed under such conditions, will destroy the fit of all working parts. It is literally true that a new car may be practicall ruined, the first time it is taken out on the road, if oiling is not attended to or it may be found in almost perfect mechanical condition, after five years of service, if there is no failure in lubrication during that period. Like many calamities in human affairs, only one slip "from the path of rectitude" is required to do the harm and one instance of neglect in the oiling of an important motor car part is sufficient to spell its ruin. Occasionally, but very rarely nowadays, a car is taken to the repair shop for the replacement of a part broken in normal service. Sometimes cars suffer collisions and need to have parts straightened or replaced, but by far the greater portion of repair shop work is the replacement or readjustment of worn parts. An overhauling is simply a search for parts which have suffered serious wear and must be tightened up, or in extreme cases replaced. The oiling arrangements of practically all recently designed cars are well nigh perfect and we venture the assertion that, when such a car requires overhauling under say 15,000 miles of service and numerous badly worn parts are found, this car is, in nine cases out of ten, a victim of lubrication neglect. Because of the unwillingness of owners to admit their own negligence, the full story of the evils of non-lubrication is seldom known. Failure to use oil and grease intelligently and consistently fattens up the repair shop, makes the new car old before its time, converts it into a rattletrap prematurely, and destroys its usefulness while it should yet be at its best.

ENGINE LOSES POWER AFTER REPAIRS

B. F. R. writes: After repairing a break in the crank case of my engine, new piston rings were put in and the valves were ground. It was then so stiff it had to be limbered



up by towing, but now it can be cranked by hand. It now runs very smoothly, but wilil not pull on hills, and seems to be overloaded, although "hangs on" to the last minute and never backfires. What causes the trouble,

Answer: Maybe it is not entirely limbered up yet. With the engine hot, take out all spark plugs and see if it can be spun over without resistance. If not, it is not yet "worked in" and power is being lost in friction. At the same time see that each cylinder is gas tight, by putting a plug in one at a time and cranking it over compression. If any cylinders leak badly, the rings are not yet fitted and power is being lost. Place the car on a level floor and see if it pushes about as freely as formerly. If not, locate and remove the drag. Check up valve and ignition timing, by the manufacturer's instructions. Be sure that the mixture is not over-rich, but adjusted for maximum pulling power.

TIRE CHANGE ALTERS ODOMETER READING

J. H. K. writes: My car is equipped with 34 x 4 inch tires, but I have had the rear ones "half soled" so that they are 35 inches in dimeter . My speedometer is operated by the drive shaft, not by a front wheel. Will this change in tire size make my odometer reading larger or smaller than the mileage actually travelled and how much?

Answer: A 34 inch wheel turns 593.2 times in travelling a mile and a 35 inch wheel 576.2 times (no allowance being made for slip in either case.) Your odometer is so geared that it registers one mile every time the rear wheels turn 593.2 times. With your 35 inch rear wheels, you will cover a mile in 576.2 of their revolutions, but the odometer mechanism will lack 17.0 turns of sufficient to give a one mile increase in its reading. Your odometer reading will be about 2.9 per cent less than the actual mileage covered. That is, for every 100 miles that you run, your odometer will show about 97.1 miles.

Champion Tractor Plugs Insure Tractor Efficiency

The tractor is one of the most severe of all service tests to which Spark Plugs are subjected.

Its low speed and continuous heavy load, whether on draw-bar or belt, develops a terrific heat with tremendous shock strain and vibration.

Its efficiency depends on the ability of its spark plugs to withstand such gruelling punishment.

STORING GRAIN IN STACKS AND HOW THEY ARE BUILT

Stacking grain crops is not a common practice on a Canadian farm. In Britain the stackyard is one of the chief characteristics of the farm, and the farm hand there has the opportunity to become skilled in the art. The moist climate in that country makes stacking of the grain necessary, and the farms are not equipped with barns large enough to hold the grain crops grown.

There are, however, many seasons and conditions in Canada when stacking the grain crops would be found beneficial and a word as to how it is done may help to facilitate the work when the busy day arrives. Round stacks are more easily built and usually keep better than ricks, and the latter should not be attmpted until the farmer has had some experience in stacking. When large ricks are desirable to allow more grain to be handled from one setting, they should be set with the long way north and south, otherwise the north side is likely to dry slowly and some grain may sprout there.

Starting the Stack

Where possile a bottom about 10 or 12 feet square should be built of poles or rails to keep the stack from getting damp . The bottom is then covered by laying a row of bundles along one side with butts out, then laying a row on top of these with the butts in the opposite direction and completing the bottom by several other rows laid in the same way as the second row, each row lapping the preceding row about to the bands.

Next the stack proper is started by laying a circular course of bundles around the outside with the butts out. These should be laid closely together and care should be taken to keep all sides as nearly level as possible. Then another circularl course should be started inside with the butts reaching out to about to the bands of the outside course. When this is finished, a third course should be laid in the middle with the butts reaching out about to the bands of the second course. In laying these courses the best and safest practice is to lay the outside course with the fork and not to step on the bundles at all whlie the second and third courses should be well settled by stepping on every bundle, the very center of the stack being tramped as hard as time will permit.

This is the great secret of building easily a stack which will keep well, to keep off the outside courses and to tramp well the inner courses. This means that when the stack settles, the outside will settle more than the center, thus causing the outside bundles to slope downwards and turn any rain which otherwise might be beaten into the center. Another great advantage of tramping the inner courses and keeping off the outside ones is that the slope from the center out does not need to be so steep as when the outside courses are tramped, and the danger of slipping is very much less.

The Bulge

After building about three or four layers with the outside layers laid up about straight and getting the middle well tramped and somewhat higher than the outside, it is usual to give the stack or rick a slight swell or "bulge," as it is usually called. This is partly for looks but mainly to give more capacity to the stack and to cause the outer bundles to have a more decided droop.

This is done by putting each outside layer a few inches beyond the course below, for about five or six layers.

A common way of doing this, as giving about the proper amount, is by twining each bundle with the long edge of the butt up. While this twining of the bundles is not necesssary it gives about the proper amount of bulge and makes a smooth appear-

Men who work in Steel Mills

and similar plants coming from an overheated shop out into the chilly night air require extra good underwear protection.

During their strenuous work, perspiration opens the pores and grippe frequently results unless the body is protected with heavy, honest wool underwear.

Atlantic Underwear affords the best protection for such workers. It absorbs the perspiration and protects against dangerous chills resulting from extremes of heat and cold.

Sold in five different weights and qualities. Our lower-priced lines are not equal to the more expensive ones, but each is guaranteed to be the best value of its class. Compare them with others of like price and see for yourself.

Made in sizes 11-7; 8-10½; 5-7½

Amherst Boot & Shoe Company Limited, Amherst, N.S.

ance. It will be well for the beginner to get off the stack occasionally to se how his stack looks, and especially that he is keeping all sides alike.

Drawing In

After laying out of bulging for five or six layers it is customary to lay two or three straight and then begin to draw in. This is usually done by turning the long side of the butts down, this giving about the correct slope. It requires a little practice to get the happy medium between two squat a stack and one that runs too high up. However, if the middle is kept full and well tramped there is very little danger in drawing in too rapidly, and the difference in capacity is not very great.

Finishing

Various methods of topping out are practised by different men, the object of course, being to turn rain and also to prevent the top from blowing off. A very common way is to save two or thee good cap sheaves and put these on the very top fastening them down with a stake run down through the centre. The best top, however, is to put a forkful of hay on tap, and weight this down with wires to which are fastened posts or pieces of rail.

A very good plan is to rake down the sides with a hand rake. This pulls out the loose material from the butts of the bundles and makes them turn the water very much better. Where the stacks are topped with hay and well raked, the usual flock of sparrows, as well as the neighbor's chickens, will find rather poor picking. The mateiral raked out of one stack may be spread over the bottom of the next one.

Precautions

The following points are the principal ones to be watched in building a stack which will keep well:

1. Do not tramp the outside course.
2. Keep middle thoroughly tramped and well filled.
3. A certain amount of bulge should be given the stack.
4. Too steep a slope to the centre will give trouble with slipping of outside layers, especially if grain is very dry. Rye is especially bad in this respect.
5. Bundles should be pitched well to the centre of stack and all loose material must be kept off the outside courses.
6. All sides of the stack should be kept even.
7. Do not try to give too much bulge.
8. Do not run the stack too high.
9. Keep the middle full and well trampled.
10. Put a good lightning rod on a pole near the stackyard and several feet above their tops, or else take out fire and tornado insurance. Plowing or discing a safety belt around the stackyard is also a cheap but effective safeguard.—I. W. Dickerson.

SEED GRAIN DISTRIBUTION

The annual free distribution of samples of seed grain is being conducted at the Central Experimental Farm, Ottawa, by the Dominion Cerealist.

The following kinds of seed grain will be sent out this season:—

Spring Wheat (in about 5-lb. samples), White Oats (about 4 lb.), barley (about 5 lb.), field peas (not garden peas) about 5 lb.), field beans (early ripening only for districts where the season is short) (about 2 lb.), flax for seed (about 2 lb.', and flax for fibre (about 2 lb.)

Only one sample can be sent to each applicant.

Applications must be on printed forms which may be obtained from the Dominion Cerealist at any time after Sept. 1st.

As the stock of seed is limited, farmers are advised to apply early to avoid disappointment. No application forms will be frunished after Feb. 1st, 1920.

C. E. SAUNDERS,
Dominion Cerealist.

An Exchange of Money That Pays—

When you buy Victory Bonds you simply exchange one kind of money for another.

A dollar bill is Canada's promise to pay.

So are Victory Bonds.

But Victory Bonds pay 5½% interest.

Consider the security behind Victory Bonds—

Canada and all that is contained therein.

Consider the good rate of interest—5½%.

Victory Bonds pay nearly twice as much as Savings Banks.

Consider the saleability of Victory Bonds—

Their use as security for a loan—

Their prospective advancement in price—

Canada must have this money to clean up our obligations to our army and maintain the prosperity of our Country.

These are the best reasons in the world for exchanging one kind of money for another.

Every Canadian should put all his weight behind this Loan.

He should exchange every dollar possible for Victory Bonds—and every dollar he can save for the next ten months.

NOT ALWAYS WISE TO DOCTOR FOWL

Much has been written on the cure of poultry diseases and many formulas have been presented, but the average poultry raiser is better off in the end not to doctor sick individual fowls. One sick hen, if allowed to run, may affect the whole flock and the ground around the house. Further, the common experience is that a sick hen which has been "doctored up" and "made well" is never likely to amount to much as a layer or a breeder . Usually the weak bird is the first to catch a disease.

Flock treatment for the prevention of disease and the cure of minor ailments is advisable, but the less "pampering," "coddling" or "doctoring" done in a chicken house the better.

The axe, after all, is the best cure and seldom, on the farm at least, is a bird so valuable as to make doctoring advisable. Using the axe freely should the first step in combating any disease. Affected birds are the most common agent in spreadng disease in a flock, and the sooner they are removed or killed the better.

SEVENTH ANNUAL CONVENTION OF NEW BRUNSWICK WOMEN'S INSTITUTE

(Continued from page 105)

knows when she may need one. Train them in the fundamental things, the value of food and how to nurse, also to study the civil government of their land, because they are citizens.

She deplored the lack of reserve power among the young and blamed the late hours the girls and boys of today are allowed to keep for much of this, also lack of discipline. We should apply more intelligence to the bringing up of our young. When it requires brains to bring up chickens to raise bees, etc., what about our children?

In the next few years we need more thrift in Canada than ever before, as we are facing a great debt. France has learned thrift and so may we.

The Women's Institutes, Mrs. Muldrew urged, could help a great deal by raising the standard of rural life. good children are an asset to the country, and when working for the welfare of the child that is an upward life. Industrial life tears down our children, there should be women inspectors of our factories.

Prepare to economize emphasized Mrs. Muldrew, hard times are coming. The value of a Canadian dollars shows this is true.

Women are moulding public opinion, it must be moulded wisely. Today there are forces that are dividing us. The Women's Institutes should bring us together.

Mrs. Muldrew spoke earnestly and was listened to with interest.

Miss McCain thanked Mr. Savoie and Mrs. Muldrew for their splendid addresses and spoke of her personal knowledge of the Vocational Schools of Alberta and the splendid work being done.

Meeting adjourned.

Thursday, 9.30 a. m.

Mrs. T. N. Vincent, President of the Free Kindergarten Schools of St. John presided over this meeting.

After the singing of "O Canada", the reports of Institutes were completed. The Hillsboro Institute reporting the winning of the prize of $10.00 given by the Department for membership and programme.

An invitation was then extended from Mr. Golding of the city, to a private screening of moving pictures in the Imperial Theatre that morning at 10.30.

It was moved and carried that a vote of thanks be sent to Mr. Golding for his kind invitation.

The report of the Credential Committee was then heard and Miss McCain explained for the benefit of those who might not understand the need of this committee.

seconded that in only 20 delegates had brought credentials, that the need be waved for this session.

Miss McCain read Greetings from the St. John Chapter of Daughters of the Empire, conveying sincere wishes for success.

Miss McCain then read the constitution of the Federation and the names of the Directorate and Representatives upon Standing Committees of the Dominion Federation, were read as follows:

Miss Hazel McCain, Miss Eliza Campbell and Mrs. J. W. V. Lawlor, directors.

Mrs. H. Lawrence, immigration; Mrs. C. J. Osman, legislation; Mrs. Royez, home economics; Mrs. Chas. Comber, education; Miss Catherine Stewart, child welfare; members of committees.

The ratification of these appointments made by the Supervisor was moved and seconded.

Report of Resolution Committee was then submitted and the following resolutions passed:

A resolution asking the government to appoint two women to the board of motion picture censors, and one asking the government to add a branch of kindergarten instruction to the normal school curriculum.

A resolution asking for support in caring for the feeble-minded and that the institutes aid Rev. George Scott, 4 Queen St., St. John, in his efforts to improve the status of the feeble-minded, was read and while approved of, it was left to the various institutes to act on this matter at their discretion.

It was moved and carried that the Resolution Committe draft a resolution re Mothers Pensions, further moved and carried that Mrs. Rose Henderson be asked to draft this.

This finishing the business of the session the meeting adjourned, to partake of a dainty luncheon prepared by the ladies of St. John, after which they enjoyed a motor tour through the city, through the kindness of a number of the citizens of St. John, who generously loaned their cars for this purpose.

The members of the French Institutes showed their appreciation of the kindness and hospitality of Mrs. J. W. V. Lawlor, president of the St. John Institute, by sending her a box of American Beauty roses, a gift which was much appreciated by Mrs. Lawlor.

MRS. M. A. MacLEOD.

THE NEW BRUNSWICK DAIRYMEN UNITED ANNUAL CONVENTION AND DAIRY SHOW

The N. B. D. U. will hold their first annual convention and dairy show in the Agricultural Building, Sussex, on December 3rd and 4th, 1919.

The first session will open at 1.30 p. m., December 3rd, and will be devoted to the cheese interests. A public meeting will be held in the evening and prominent speakers will be present to address the gathering on popular topics.

The morning session on the 4th of December will be devoted to the butter and creamery interests and the afternoon will be given over to the business of the organization.

Fuller announcement as to the programme and prize list will be announced later.

HOW TO TELL YOUR BEST LAYERS

Everyon knows that some hens lay much better than others, but not everybody who keeps hens has the time or equipment to figure out the exact difference between a good layer and a poor one. Professor M. C. Herner, head of the Poultry Department, Manitoba Agricultural College, has some very startling figures in this connection as a result of using trap nests and keeping careful records. In one season, out of 325 pullets there were a hundred that laid over 100 eggs. Of these there were 25 that laid over 175 and four that laid over 200. Of the remaining hens that laid less than 100 eggs, there were some that laid only three. There were even two that did not lay any eggs at all.

Now, a poor layer eats just as much or nearly as much as a good hen and takes up as much room and gives as much trouble. It is obvious that if you are keeping hens at all, it pays to keep the kind that will lay well.

There are certain points to look for in selecting good layers, assuming that you cannot use the trap nest system and determine the matter accurately.

1.—As a rule poor layers are fat, lazy hens. 2.—Poor layers molt early in the summer. 3.—They remain on the roost late in the morning and go back early in the evening. Good layers, on the other hand, are bright, vigorous, active hens, working and scratching all day long. As a rule, heavy layers molt late in the season, in September, or even as late as October.

There are many important points to note in selecting good layers such as the fact that in yellow-legged breeds, poor layers have legs of a rich yellow while the good layers have legs of a paler, faded yellow. In heavy layers, too, the pelvic bones are much farther apart than in poor layers.

The Tracks Save Power

The Cletrac Tank-Type Tractor runs on metal tracks like a locomotive. Three wheels on each side carry the entire weight of the machine and run on the endless tracks which are laid down and picked up as the Cletrac goes along.

This distinctive feature enables the Cletrac to work efficiently on wet or sandy soil, sod, snow or ice. It permits it to go over the seed bed without packing the soil. The Cletrac will work on hills where most tractors fail.

Small But Powerful

The Cletrac is only 96 inches long, 52 inches high and 50 inches wide, enabling it to work up close to trees and fences, and making it ideal for orchard use. The Cletrac is extremely powerful. It has a speed from 40 to 50 per cent. greater than the average tractor.

The Cletrac does *more* than plow. It goes right through from plowing to harvesting. In addition, it does the belt work on the farm.

The Cletrac is specially designed to operate on kerosene. More economy.

Write for the illustrated booklet "Selecting Your Tractor."

St. Catharines, Ont.

Since purchasing my Cletrac I have had it in almost continuous use. Before buying a Tractor I attended a number of demonstrations and investigated to my own satisfaction the merits of the various Tractors that are on the market, finally purchasing the "Cletrac" in preference to any other make, and I am entirely satisfied with the results I have obtained.

Yours very truly,
Geo. Goffin.

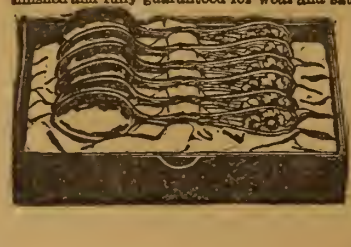
97 Piece Dinner Set

and Lovely Set of

Rogers Spoons

A MARVELLOUS OFFER TO QUICKLY INTRODUCE A DELIGHTFUL NEW PERFUME!

YOU can secure without a penny of cost this magnificent 97-piece English Dinner Service and a lovely set of half-dozen Wm. A. Rogers teaspoons. Each dinner service is guaranteed full size for family use, its 97 pieces comprising 12 cups and 12 saucers, 12 tea plates, 12 dinner plates, 12 bread and butter plates, 12 soup plates, 12 sauce dishes, 2 platters, 2 oval covered vegetable dishes, a cream jug, covered sugar bowl, a gravy boat, pickle dish, and a salad bowl. It is handsomely decorated in rich floral design and will surely delight the most fastidious housekeeper. The beautiful set of teaspoons are in the famous Wm. A. Rogers Rideau Castle design beautifully finished and fully guaranteed for wear and satisfaction.



Read Our Wonderful Offer

We have just produced a delightful new perfume known as "Coronation Bouquet." It is so delicate and fragrant that we know every woman who tries it once will use it always, so we are sparing no expense to secure representatives in all parts of Canada who will help us by introducing this lovely new perfume to their friends and neighbors. That is why we offer to give away these magnificent and costly premiums.

Will you sell just 16 bottles among your friends at only 25c. each?

You can do it quickly and easily in your spare time as everybody you know will gladly try a bottle of this lovely new perfume at only 25c. Send us your name and address to-day and we will send you the 16 bottles all postage paid, and trust you with them until sold. Then return our money, only $4.00, and we will promptly send you the beautiful set of spoons, and the handsome dinner set you can also receive without selling any more goods by simply showing your fine reward among your friends and getting only seven of them to sell our goods and earn our fine premiums as you did. We arrange to pay all delivery charges right to your door.

REMEMBER YOU TAKE NO RISK. You do not spend a cent of your own money. We trust you with our goods until sold, and if for any reason you cannot sell them we will take them back and give you beautiful premiums or pay you a big cash commission on the quantity you do sell. Write to-day. Address: 15D

Safeguard Your Market

THE demands of Great Britain determine in large measure the prices of Canada's farm products.

Without the mother Country's purchase of these surplus products of Canadian farms, Canadian Agriculture would lose its best overseas market.

Great Britain is ready and willing to buy all the farm products that Canada can let her have, but Britain is temporarily unable to pay all cash for these products. Canada, therefore, must extend credit to her if we are to retain this necessary market.

Canada pays cash to the Canadian farmers for their produce and sells that produce to Great Britain on credit.

If Canada does not extend this credit to Great Britain other countries will be glad to do so.

During the War Canada's surplus crops and farm products were financed by Victory Loans. The result was that every Canadian farmer had a market at good prices for his entire crop.

This year's crop and farm products must be financed in the same way---by the Victory Loan 1919.

Victory Bonds are, as every shrewd investor knows, an investment of the highest class. The interest rate is five and a half per cent., and the interest payments regular. The security is undoubted, and the bonds may be readily turned into cash at any time.

The Loan is vitally important to every farmer in all Canada. It is, therefore, to his interest not only to invest heavily in Victory Bonds 1919, but to work among his neighbors to make absolutely certain the success of the Loan.

KEEP
Holstein-Friesian Cows

1. The Holstein-Friesian is a large vigorous cow, full of energy and abounding in vitality.
2. Her physical organization and digestive capacity are such that she is able to turn to the best advantage the roughage of the farm, converting the same into merchantable products.
3. She yields large quantities of most excellent milk, fit for all uses and especially suited for shipping purposes.
4. Heredity is so firmly established through her long lineage that she is able to perpetuate herself for the production of strong, healthy calves.
5. When for any reason her usefulness in the dairy is at an end, she fattens readily and makes excellent beef.

If you can't buy a herd, buy a heifer

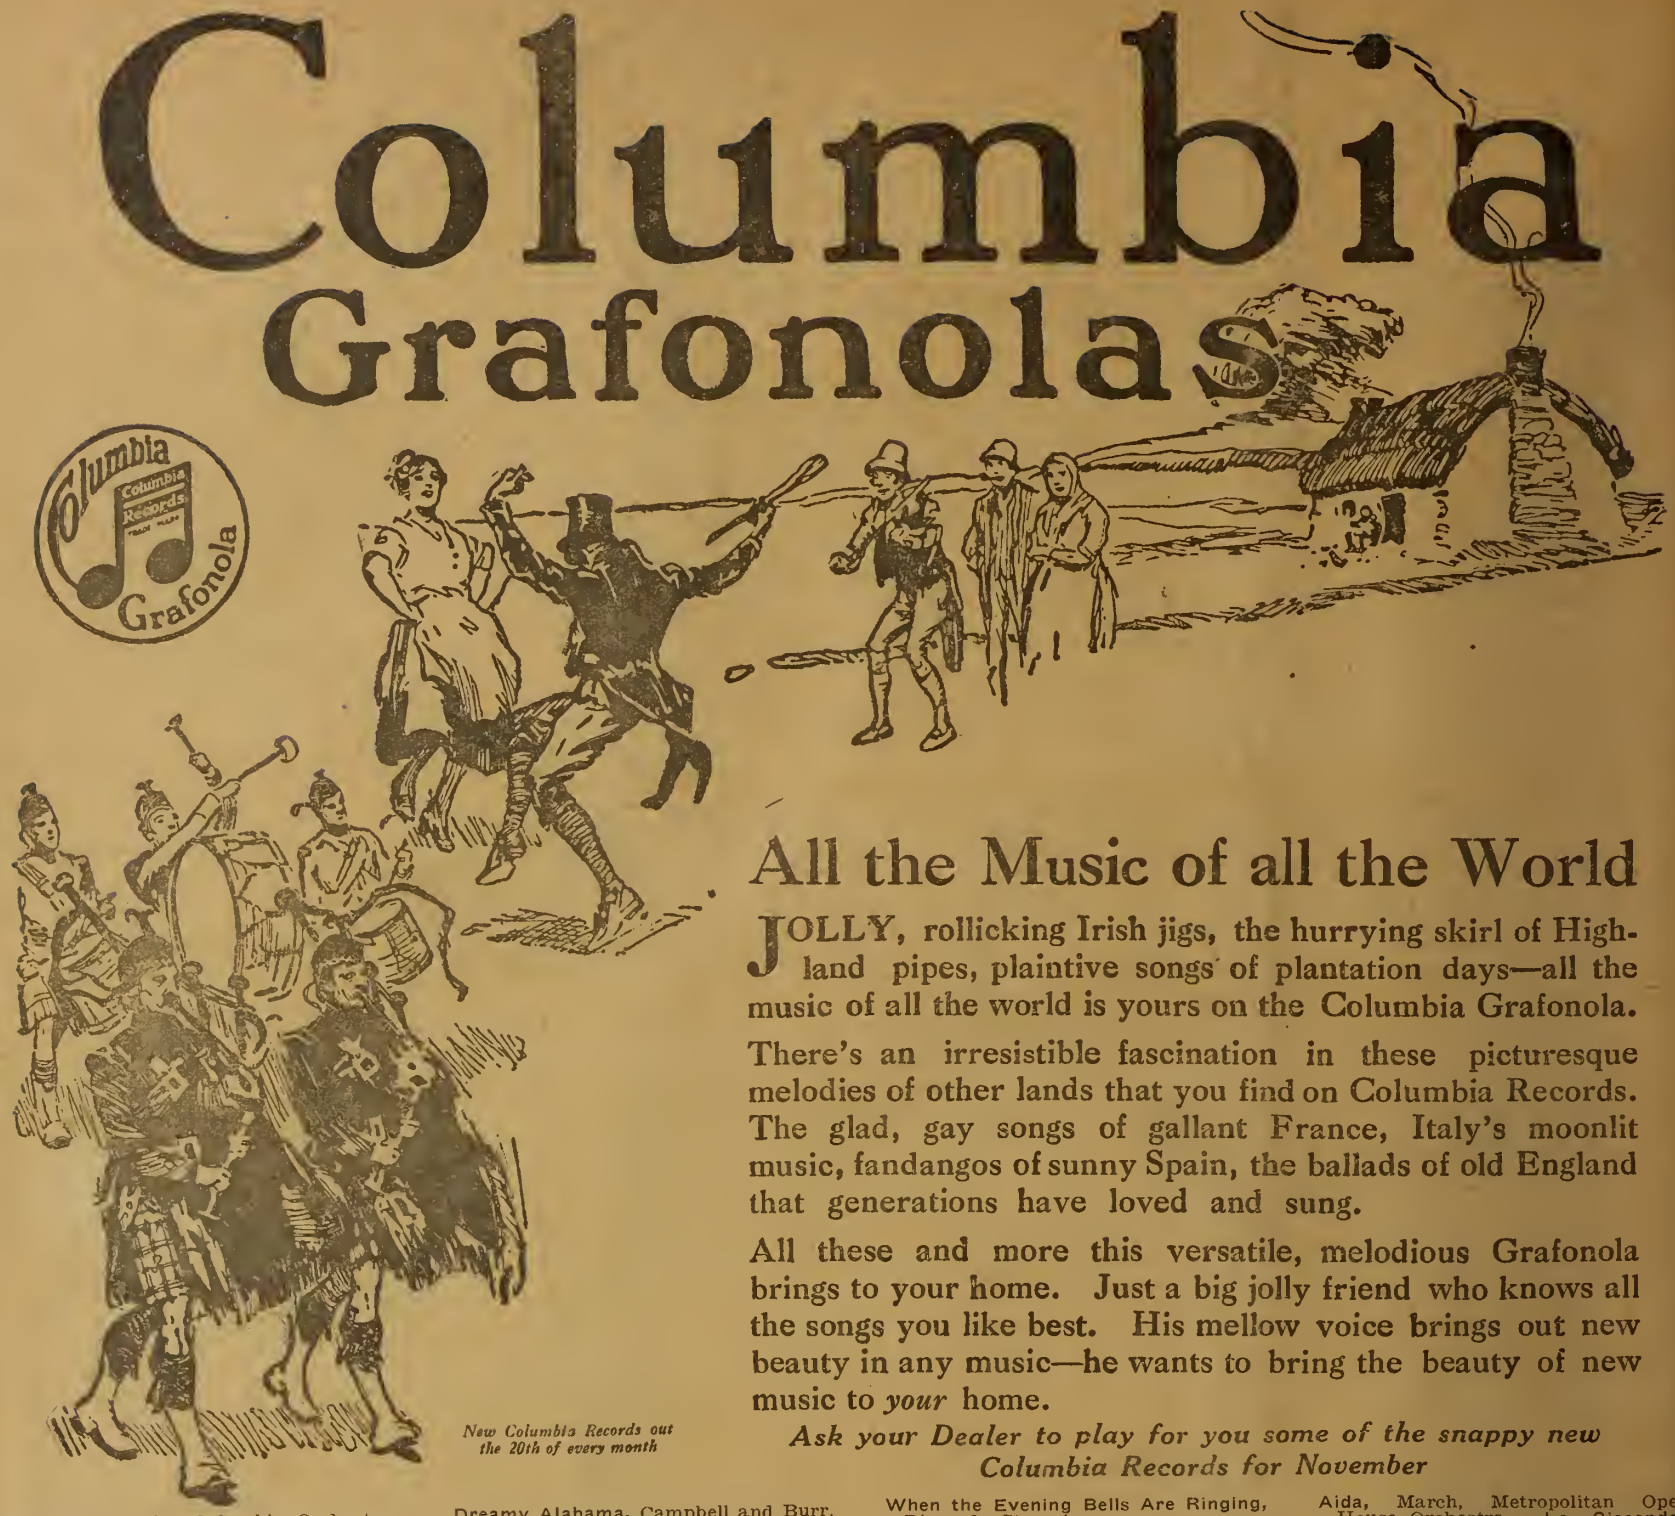
Columbia Grafonolas



All the Music of all the World

JOLLY, rollicking Irish jigs, the hurrying skirl of Highland pipes, plaintive songs of plantation days—all the music of all the world is yours on the Columbia Grafonola.

There's an irresistible fascination in these picturesque melodies of other lands that you find on Columbia Records. The glad, gay songs of gallant France, Italy's moonlit music, fandangos of sunny Spain, the ballads of old England that generations have loved and sung.

All these and more this versatile, melodious Grafonola brings to your home. Just a big jolly friend who knows all the songs you like best. His mellow voice brings out new beauty in any music—he wants to bring the beauty of new music to *your* home.

Vol. 25 SUSSEX, N. B., NOVEMBER 25, 1919 No 4.

"YOU SEE IT'S A MARITIME FENCE"

Maritime fences will stand the severest tests, because they are built throughout of extra heavy hard drawn No. 9 steel wire. The superior stretching power of No. 9 wire keeps the strands from snapping under heavy strains or hard frosts. Each fence is thoroughly galvanised and will sturdily resist the rust and rot of weather.

STANDS THE TEST OF MAN, BEAST, WEATHER and TIME

The strands and stays are firmly gripped at every join by our special time tried and tested never-slip lock. Even after years of hard service, Maritime wire fence retains its sagless shape and sightly appearance. All Maritime Fences are carefully inspected and rigidly tested before leaving the factory. When you buy it you know you have got something that is bull strong and hog tight, something that will withstand greater strain than it is ever likely to receive.

Before you buy fencing it will pay you to first learn what the Maritime has to offer in the way of real fence service.

For sale by agents and dealers in nearly every section.

If you don't know the local dealer, write to us direct.

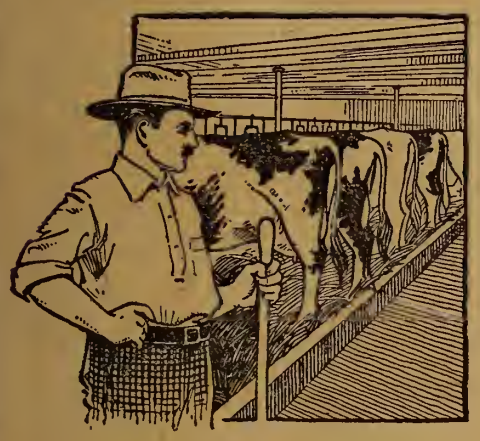
Four Cleaning Processes

No Screenings—No Weed Seeds—No Waste of Feed

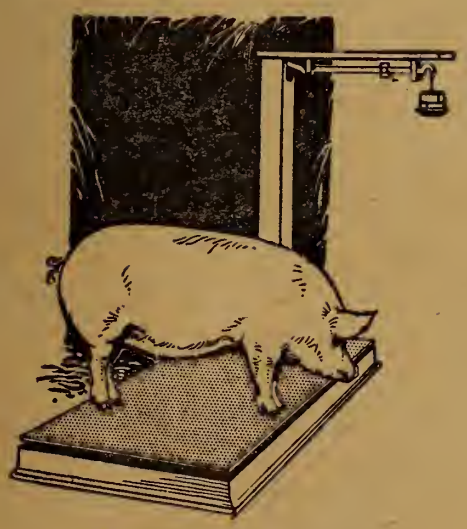
Monarch Poultry Feeds.

There is a feed for every branch of your work, specially made to give best results. Monarch Chick Feed, Monarch Developing Feed and Monarch Growing Mash for your chicks from the time they are hatched until they reach laying maturity. Monarch Scratch Feed and Monarch Laying Mash for your hens and Monarch Fattening Mash for finishing your cockerels for market.



Monarch Dairy Feed.

A properly mixed combination of Oilcake Meal and Cotton-Seed Meal with the bulky feeds, Bran and Corn Feed. Guaranteed analysis: Protein 20%, fat 4%.



Monarch Hog Feed.

Consists of Corn Feed, Barley Oilcake Meal, Shorts and Digester Tankage. Guaranteed analysis: Proteins 15%, fat 4%. This is a special purpose feed for hogs only. A complete feed for the brood sow and the growing pig. High in protein and low in fibre, it furnishes body-building material of high digestibility.

WHEN you have bought a ton of Monarch Feeds you can absolutely depend upon having valuable feeding materials only. These will build up your poultry or stock at low cost. You know before you buy that you positively are not paying for quantities of useless materials such as screening weed seeds, chaff and dust. These are often dangerous to stock and poultry.

Monarch Poultry Feeds, for instance, are made from sweet, sound grains. They are cleaned no less than four times, twice before and twice after mixing. This painstaking care is typical of *every* brand of Monarch Feed. The result is that every pound of

Monarch Feeds

provides the maximum of feed value. Besides, in Monarch Feeds you are always sure of scientifically correct amounts of body-building protein and other essential ingredients in true and proper balance.

Buy from the Mills that have a Reputation to Maintain

If you want to feed so as to make every dollar bring you fullest value in big hogs for early market, large yields of milk from properly fed cows and heavy production of eggs from your poultry, follow strictly the advice of the Farmer's Advocate:—

> "We would advise farmers to be careful in their feed purchases and deal with houses having an established reputation for an honest product."

The reputation of the Campbell Flour Mills Company Limited is of fifty years standing. Each different Monarch Feed is the best for the purpose for which it is made. Every bag bears our name, and you can depend upon these feeds at all times.

You will find Monarch Feeds at best dealers everywhere—if your dealer does not sell them, write us direct for full particulars and we will tell you nearest place to get them.

The Spirit That Wins :

Our advertisement **"Fit Our Fighters to Farm"** was an appeal to the noble and generous sentiments of our best Rural Citizens. They are responding as we thought they would. A few extracts are culled from a sheaf of replies from widely separated parts of Canada:

From Rocklyn, Ont.: "I wou'd like to have one of the 'boys'. He would have a good comforta ble home and be treated as one of the family."

From Killarney, Man.: "I wish to secure help for the winter and would prefer a returned soldier. Could show him the practical side of stock feeding on a mixed farming plant."

From Watrous, Sask.: "I would be only too pleased to help you and a returned soldier."

There are many like the above.

We have hundreds of returned soldiers who wish to gain experience this Winter and next Summer so that they can take up farms of their own. Write the nearest District office of the Board if you can assist.

District Offices at: Victoria and Vancouver, B.C.; Edmonton and Calgary, Alta.; Regina, Saskatoon and Prince Albert, Sask.; Winnipeg, Man.; Toronto, London, Fort William and Ottawa, Ont.; Quebec, Montreal and Sherbrooke, Que.; St. John, N.B.; Halifax, N.S.; Charlottetown, P.E.I.

THE SOLDIER SETTLEMENT BOARD
W. J. Black, (Chairman)
Union Bank Building, Ottawa, Ont.

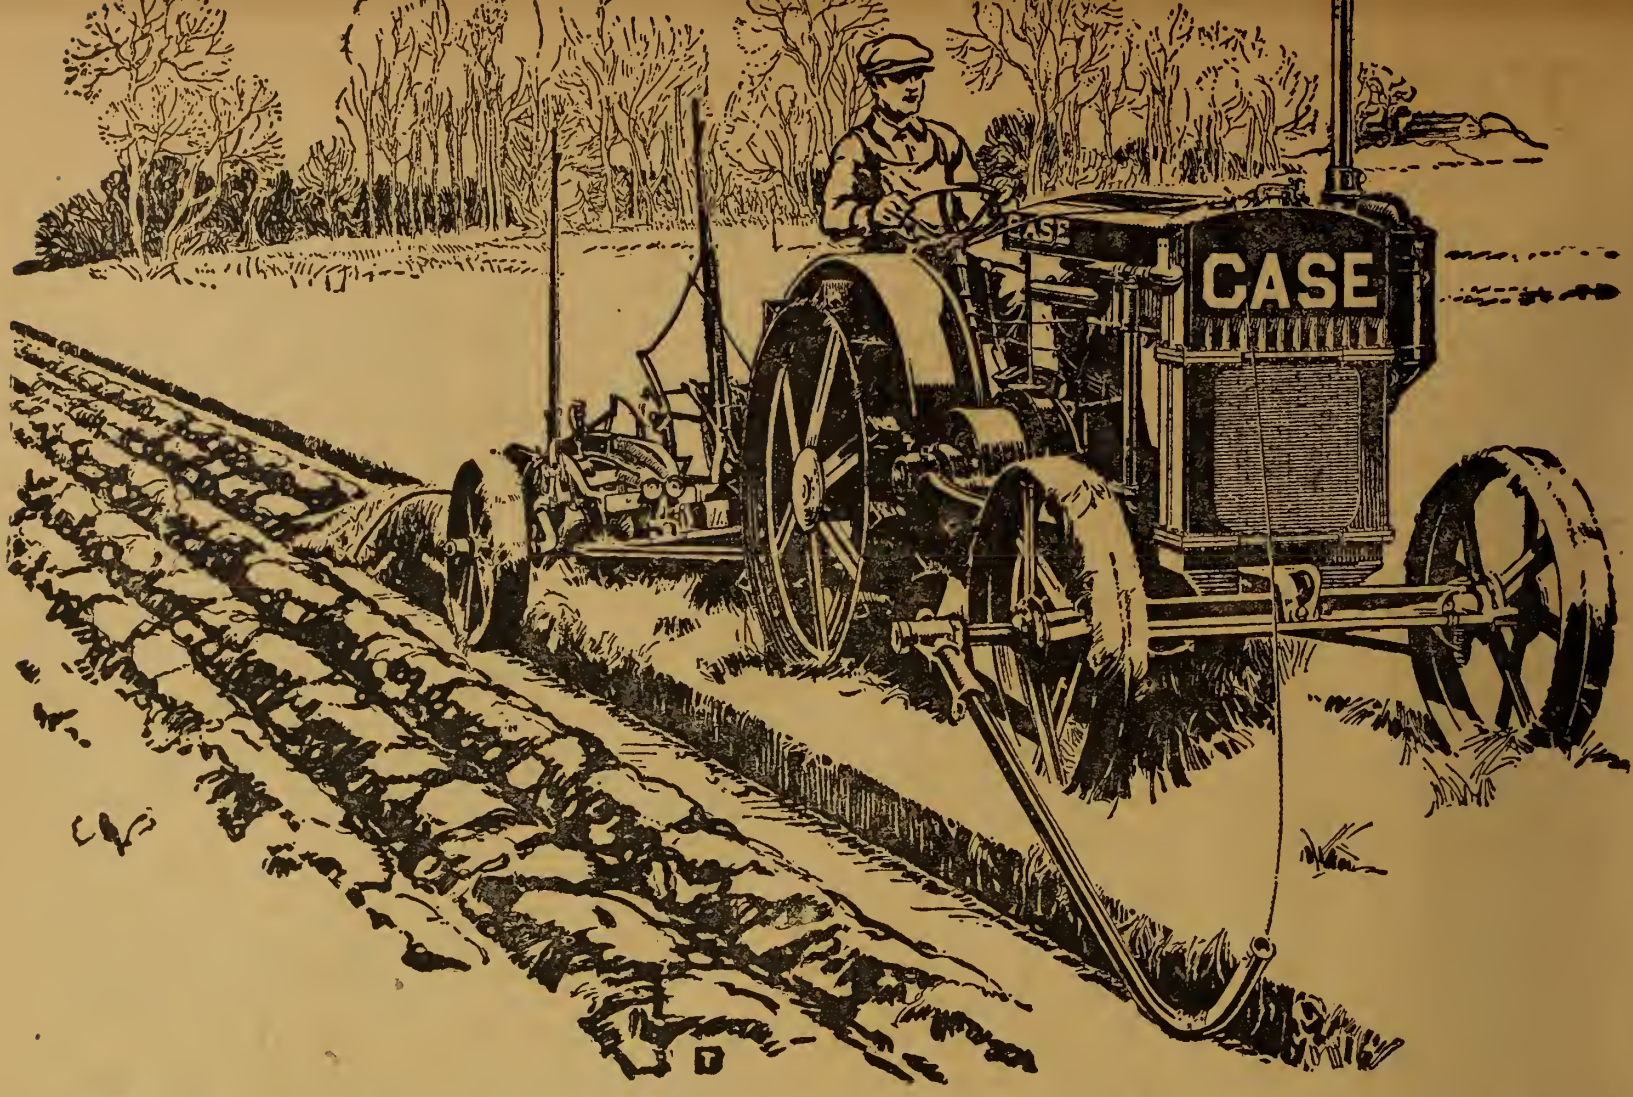
FERTILE EGGS BIG LOSS NOW

dFJM —hY .DBFo.. 1avd weak,

What is an infertile egg? It is one in which the germinal cell has not been fertilized as the result of the hen mating with a male bird and which in consequence is incapable under any conditions of developing into a chick. While hens mated or running with a male may produce some infertile eggs, if the stock is strong and healthy a large majority of the eggs produced will be fertile. On the other hand if the hens have been running without a male for ten days or two weeks the eggs laid by them will be infertile.

A fertile egg placed in an incubator or under a hen will begin to develop into a chick. This development does not need to go far before the egg is no longer usable for eating purposes. For this development of fertile eggs to take place it is not necessary for them to be placed in an incubator or under a hen, for the development will start whenever and wherever they are subjected to the high temperatures which are likely to be encountered during the summer in their journey to market. Since infertile eggs are not capable of this chick development, they make a much more satisfactory market egg and the loss which now occurs in the form of blood rings and eggs with partially developed chicks in them would be entirely avoided if only infertile eggs were marketed.

It will, therefore, be seen that it is of the utmost importance to produce infertile eggs only after the breeding season is over. To accomplish this it is only necessary to sell, kill or confine the male birds so that there will be no males running with the hens.



Wins Ontario Plowmen's Sweepstakes from 26 Competitors

This Remarkable Feat Demonstrates the Superiority of the

CASE

Kerosene Tractor

THIS is the latest record of the Case 10-18 Kerosene Tractor—established in the Ontario Plowmen's Association Sweepstakes, held at Chatham, Oct. 23rd. ¶ This was not a test of speed but of performance, by actual farmers, and results—and the Case won over 17 other makes of tractors. ¶ This is the tractor that won over all competitors at the fuel tests of the Cercle Agricole of St. Blaise, Que. This is the tractor you need on your farm. ¶ The Case 10-18 Kerosene Tractor has a four cylinder valve-in-head motor, set crosswise on a one piece main frame. This frame construction assures permanent alignment of all shafts, bearings and gears. No bevel gears, chains, worms or friction drive parts required. ¶ It also permits of placing the belt pulley on the crankshaft, giving a direct drive. It affords the use of all spur gears which save power. All gears cut steel, enclosed and running in oil. Other exclusive features include the patented Case air washer, preventing dust from entering the motor, thereby prolonging its life. The Sylphon Thermostat keeps the engine at a uniform temperature, important for successfully and economically burning kerosene. Copper fin and tube non-clogging radiator with removable cast frame. Hyatt Rollers for all important bearings. ¶ The Case 10-18 is adaptable for plowing, discing, seeding, harrowing, haying, harvesting, threshing, silo filling, hauling, and many other farm jobs. Holds records for fuel economy. Develops 20% more belt power than rated. Weight only 3500 pounds. ¶ You cannot afford to overlook the outstanding advantages of the Case if you want the most value your money will buy. ¶ Let us show you why the Case Tractor out-distances all competition.

Volume 25. SUSSEX, NEW BRUNSWICK, NOVEMBER 25, 1919. Number 4.

What The Maritime Egg Laying Contest Shows

A. C. McCulloch, Poultry Supt., Fredericton

The first annual egg laying contest held in eastern Canada at the Dominion Experimental Farm, Charlottetown, P. E. I., was concluded on Sept. 30th 1919, (11 months). Like all contests of this nature, which have been held for a number of years in various parts of this and other countries, it brought to light a great amount of data exceedingly valuable to Maritime poultry raisers. The contest comprised twenty pens of eight birds each. A record was kept of the daily egg production of each bird, the food consumption of each pen, etc. Pens were received from the five eastern provinces as follows: Ontario, one; Quebec, four; New Brunswick, three; Nova Scotia, five; and Prince Edward Island, seven.

Seasonal egg production is a factor which to a remarkable extent, much more than is geenrally supposed, determines the amount of profit or loss in poultry raising, not that poultry raising in general is dependent upon favorable climatic conditions, but some varieties are better able than others to produce well against advertse conditions. For the propogation of the species spring egg production only is natural and necessary, but for the production of food for man in profitable quantities winter and prolonged summer and fall production are essential. As the bird must bear this extra burden to justify her claim to the advantages of civilization, in unnatural seasons, it naturally follows that the one which is least effected, other things being equal, is the most valuable.

In a general sense annual egg production is divided into two parts, winter and summer. A finer division would include spring and fall, but for practical purposes these may in most cases be omitted. The winter season in most sections concludes about March 1st. Production may be calculated from the time a bird begins to lay, but in flocks, especially a more common method is to commence all birds on the same date, usually November 1st. A year's production for such a pen would conclude on Oct. 31st following whether the birds had ceased laying or not.

The following, Table No. 1, gives the production of the various varieties in the contest to March 4th. Weekly reports only are available, hence calculation is made to this date.

	Pens	Total Eggs	Average per Bird
Barred Rocks....	5	1220	30.5
White Wyandottes	3	795	33.1
Rhode Islasd Reds	3	467	19.4
White Leghorns.. and Anconas...	9	1505	20.9
All large varieties	11	2482	28.6
White Leghorns.. and Anconas...	9	1505	20.9

The foregoing shows the White Wyandottes leading with Barred Rocks only 2.6 eggs each per bird behind. This lead was obtained by two of the White Wyandotte pens being in heavy lay when the contest began, but it was soon overcome and surpassed. The total for all the large varieties, eleven pens in all, as against nine pens for the lighter varieties, should make a reasonably significant comparison and shows a lead of 7.7 eggs per bird in favor of the former. It should be remembered these are laid during the season of high prices.

According to popular opinion, birds which do not lay well during the winter will make up the deficit during the following summer. The evidence in the following table is sufficient to dispose of ths claim.

Table No. 2, showing production of various varieties between March 4th and September 30th, the end of the contest.

	Pens	Total Eggs	Average per Bird
Barred Rocks.....	5	4646	116.1
White Wyandottes	3	2289	95.3
Rhode Island Reds	3	2077	86.5
White Leghorns.. and Anconas...	9	7706	107.0
All large varieties	11	9012	102.4
White Leghorns.. and Anconas...	9	7706	107.0

This table shows the large varieties in the same order for summer production as for winter production. The lighter ones obtained a lead over the average of the heavy varieties during this season, which lead was secured in the months of lowest prices as will be shown in another table.

Table No. 3 showing annual egg production of the various varieties.

	Pens	Total Eggs	Average per Bird
Barred Rocks....	5	5866	146.6
White Wyandottes	3	3084	128.5
Rhode Island Reds	3	2544	106.0
White Leghorns.. and Anconas...	9	9211	127.9
All large varieties	11	11494	130.6
White Leghorns.. and Anconas...	9	9211	127.9

One of the most outstanding features of the preceding table is the distinct lead of the Barred Plymouth Rocks over the other varieties. Three of the five pens of Barred Plymouth Rocks are from New Brunswick, from eggs of high laying strains distributed by the Poultry Division of the Department of Agriculture. These three pens which stood first, third, and sixth in number of eggs, laid, have a combined total of 3702 eggs or an average of 154.2 eggs per bird. Of the five pens of Barred Rocks in the contest, four finished within the first six places, first, scond, third, and sixth, in point of total gggs laid.

When different numbers of several varieties or groups are under observation the percentage production is an easy and just way of making comparisons.

The percentage production is the relationship between the actual production and the possible production providing each bird lays every day, e.g., if a hen lays fifty eggs in one hundred days her percentage production is fifty.

Table No. 4 giving percentage production of each variety in 4 week periods.

Table No 4 giving percentage production of each variety in 4 week periods.

	Nov	Dec.	Jan. 28	Feb. 25	Mar 25	Apr. 22	May 20	June 17	July 15	Aug. 12	Sept. 9	Sept 30
	p. c.	p. c.	p. c.	p. c.	p. c.	p. c.	p. c.	p. c.	p. c.	p. c.	p. c.	p. c.
Barred Rocks.....	8.3	28.5	26.6	33.5	46.3	57.0	62.6	60.5	55.4	50.0	54.2	48.8
White Wyandottes.	21.1	28.0	23.9	28.0	43.3	58.3	54.0	50.7	45.3	31.9	38.5	37.1
Rhode Island Reds.	5.6	22.7	16.0	14.7	38.2	54.6	49.8	51.7	42.2	29.9	29.9	19.9
White Leghorns.... and Anconas.....	5.4	12.7	16.8	28.8	50.3	62.7	61.7	63.4	51.8	38.2	41.6	21.1
All Heavy Varieties	11.	26.8	23.0	27.7	43.3	56.7	56.8	55.4	49.1	39.6	43.3	29.7
White Leghorns.... and Anconas.....	5.4	12.7	16.8	28.8	50.3	62.7	61.7	63.4	51.8	38.2	41.6	21.1

In the preceding table the egg production under each date is for the four weeks preceding that date, except in November and December, which is for the month, and September 30th, which is for three weeks only, at which time the contest closed. Among other things this table shows the heavy varieties to surpass the others during the winter and also to maintain their production over a longer period. This point in itself is significant of heavy producers. The Barred Rocks compared with the Leghorns, e. g., were surpassed slightly on only three occasions during the contest, and those during the spring. They maintained a uniformly high production throughout which is characteristic of most high annual producers. On the average the bird which commences to lay reasonably early will lay reasonably late the following fall and her inherent ability to lay heavily helps her to hold her own during the flush season or spring months. It naturally follows that the hen which moults early is not likely a heavy producer, whereas the one which carries her faded ragged plumage late into the season takes life as a serious matter and lays as heavily and as late as possible, taking only a few weeks leave to regain her new coat for Christmas. The early moulter takes lif eeasy, doesn't believe in exertion, and is generally more ornamental than useful. Moreover, the early moulter and low layer one year is usually the early moulter and low layer in succeeding years.

The records show that moulting began among the light varieties earlier than among the heavier ones. It was reported first in the week ending July 15th and was rather common among the light varieties during the balance of the month. In August there was very little moulting in either group, but at the end of that month and for the first three weeks of September, moulting was in full swing among the light varieties, but was delayed until the last week of September before it became common among the heavier varieties. About half of the cases of moulting among the heavier varieties were reported during the week ending September 30th. This is not intended to convey the impression that Leghorns moult earlier than the heavier varieties, but to show that by prolonging th laying season the heavier varieties added considerably to their year's true in the case of Barred Rocks. See Table 4. In the five pens of Barred Rocks ten cases of moulting were reported and over half of these were during the last week. The only pen in the contest in which moulting was not reported was a pen of Barred Rocks owned by Molly Neales, Hartland, N. B. This pen rose from eleventh place to sixth during the last four weeks and actually laid more eggs per week the last two weeks of September than any week after June 26th.

The effect of broodiness upon egg production is not well understood. It is common observation that broodiness is much more common among the heavier varieties than among the light varieties. In the contest the relationship was about ten to one. But the heavier varieties laid the greater number of eggs. The question, therefore, was this in spite of or because of the greater amount of broodiness? One naturally says the former. However, it is doubtful if broodiness in moderation decreases production perceptibly. Prolonger or persistent broodiness no doubt does. But it is frequently observed that a hen lays unusually heavily just previous to and just after a broody spell. Her system receives a rest and it is doubtful if any time is lost.

The foregoing is but a small part of the information to be gleaned from the contest reports, but it clearly substantiates some of the more recent observations and reports on experimental and investigational poultry work. More may be reported at a later time. The contest is being repeated and several others in various provinces of the Dominion have been started this year.

THE MARITIME FARMER

And Co-operative Dairyman
Registered Trade Mark
Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Frult Growers' Associations; The New Brunswick Frult Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definite order for discontinuance is given,

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.
Contract rates on application.
Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME PUBLISHING CO. or
R. D. Robinson Publishing Co., Limited
Sussex, N. B.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

DATES OF ISSUE.

December (Xmas) - - - - 9—23

NOVEMBER 25, 1919

PEDIGREE DOES NOT MAKE THE BULL

A few well-reasoned words as to the scrub bull question were printed in a recent issue of The Oaklahoma Farmer-Stockman.

"Unfortunately," said the writer, "many men assume that all registered bulls are worthy. While it is true that a well-bred bull may not have developed into a useful individual because of some accident or mismanagement during his growing period, yet it should be recognized that occasionally even in the best of herds individuals are sometimes produced which can be classified as 'registered scrubs.'

"Any pure-bred bull with a mean head, shallow body, narrow chest and extremely long legs shoudl be castrated regardless of his breeding. Such individauls are not only detrimental to those who use them, but bring the breed to which they belong into disrepute. It is unfortunate that all breeders do not have courage enough to castrate such misfits rather than offer them for sale.

"A few instances will serve to show the value of pure-bred sires.

"The highest priced load of grass-fat cattle reaching any of the central markets during 1918 were purchased in Montana from the use of pure-bred shorthorn bulls on grade cows.

"The highest priced load of cattle ever shipped from a central market for feeding purposes, were produced in Colorado by the use of pure-bred shorthorn bulls on a herd of ordinary range cows and sold at $20.75 per hundred.

"The highest price ever paid for a load of fat cattle on the Oklahoma City market was for a load of steers sired by pure-bred shorthorn bulls used in Oklahoma. On the same market 24 head of grade shorthorn dry cows sired by pure-bred bulls were sold directly from wheat pasture netting the shipper slightly more than $100 per head.

"Such illustrations could be multiplied indefinitely, and in every instance the added value of market cattle, whether feeders, grass-fat cattle, butcher stuff or finished beeves, is always traceable to the use of pure-bred, registered sires of merit.

"No carload of cattle sired by scrub bulls has ever attracted attention on the central markets because of the price at which they were sold, unless it was due to the variation downward rather than upward from the average.

"The only place where a scrub can compete with a pure-bred bull is in the hands of a man who insists upon providing for his cattle in such a manner that only an undersized scrub can live. Changing conditions will gradually eliminate such men from the ranks of cattle breeders who look for efficiency."

LAYING EGGS BY ELECTRIC LIGHT

During the past year results have been announced of experiments to show the advantage of having the hens supplied with electric lamps to increase the egg production and reduce costs.

One of the latest to report is the Manitoba Agricultural College where the Birdies were provided with their "reading lamps" from 7 a. m. until daylight and from dusk until 10.30 p. m. It is not meant to infer that they sat and read by the light of the glowing filament. Far from it. The lazy birds simply layed around all over the pen.

The conclusion arrived at was that for neavy winter egg production the use of electric light to supplement the period of daylight is of great value.

Accurate records of the food used and the number of eggs gathered for the period from November 15th, 1918, to March 1st, 1919 gave the following marked difference in cost of egg production:

	Lighted Pens	Unlighted Pens
Number of eggs laid.....	6324	3757
Cost of feed.....	$111.30	$105.60
Cost per egg.....	1.9c	2.8c
Cost per dozen.....	21.1c	33.6c
Cost of light	11.50	

THE SONG OF THE LAZY FARMER

My neighbor says when it is hot that he would rather work than not, at harvesting or haying; he says when he gets up a sweat, and gets as hot as he can get, the work is just like playing. His shirt is open at the neck, he doesn't mind the heat, by heck, his muscles all are limber; he says the heat don't hurt a bit if you don't worry over it, or beat it for the timber.

Now when the sun is beating down and all the grass is dry and brown, I don't feel much like working; I take a jug of lemonade, and long before the hay is made, I feel a lot like shirking. My hired man is young and spry, I let him do the work while I am taking my work easy; I like to keep my pulses cool instead of working like a fool, and get all sweat and greasy. It doesn't pay to get up until you're panting like a pup, or be in such a hurry; instead of keeping on the jump I sit around beside my pump and let my neighbor worry.

GETTING RID OF OLD-TIME METHODS

While farming is growing more complex than it used to be it is also increasing in interest to the men who have studied it as a science and as a business. We have abandoned old methods because new ones yielded a more satisfactory return. We are keeping better live stock because the scrubs failed to pay a profit on high-priced land, labor and feeds. We have used improved methods of selecting seed grains because they increased our crop yields. Many practices have been modified because of the advance in the cost of operating the farms and the difficulty of securing good help. The production of several kinds of crops and the feeding of more good live stock equalizes the farm income and provides profitable employment for the hired hands from month to month and year to year. The farmer of today is endeavoring to place his business on a plane of efficiency that will make it possible for him to count upon cost of production plus a sufficient profit to maintain himself and family in comfort and provide reinvestment in the business to make good unavoidable losses and depreciation.

FARMERS SET GOOD EXAMPLE

The Mail and Empire of Sept. 29th says:

"What we need in Canada is a full appreciation of the utility of hard, steady work. Whatever may be said as to food prices, no one can deny that the farmers set a good example in this respect. If everyone worked on the same ratio we should all be having lower costs of living, and about as much ultimate profit—except the seller of luxuries and promoters of fake schemes. When other nations are in turmoil in industry, the influence of Canada's farmers should be put steadily behind sane, sensible Government that has regard for th interests of th people as a whole, not of special classes, and their special class appeals."

Why, then, deny to farmers a proper proportion of representatives in the Legislature? Argue around it as you will, this country will go steadily on the downward track if the decline in agriculture is not checked.

INFERIOR STOCK SHOULD GO TO THE BLOCK WHEN PRICES ARE HIGH

Never were conditions more favorable for culling herds and flocks closely and sending inferior animals to market. There is no excuse—financial or patriotic—for farmers to retain inferior, scrub animals when the market invites their presence, at prices which will net the owner more than they have ever been worth. But it will not do to delay, for at present prices for feeding matrials inferior animals soon eat their heads off.

Now, that all kinds of meat products are high and the values of good young males are on a reasonable basis, the farmer is best fixed to make a change in policy by marketing all the inferior bulls, boars and rams on his farm and putting in their places superior young males, from the herds and flocks in the country, that are bred in the blood which has proved its calue where it has been properly handled. The accepted time to cash in on scrub males is right now when they will sell for more than enough to pay for better ones to put in their places.

LOSS FROM SCRUB RAM

Says the Dominion Live Stock Branch: "The Markets Representative of the Branch at Montreal, Mr. S. N. Chipman, who assisted the shippers in marketing their lambs, estimates that more is lost to the farmers each year through the use of schub than can be gained under the most improved system of marketing. Quality is counting far more than weight, and scrub stock has been at a discount at all the yards to the xtent of from 4 to 4½ cents per pound. At $2.50 per head the loss on 20 lambs would amount to $50.00 and on 100,000 lambs (5,000 x 200 to $250,000. Can any farmer afford this loss? Canada can't. The Branch would be glad to hear from any farmer who decides to use a good pure bred ram, or ram lamb, this fall as a result of seeing this comment."

Cash Crops and Big Business on the Tobique Valley

By O. C. Hicks, B.S.A., Forage Crop Specialist

There has been big business done in the marketing of cash crops from the valley of the Tobique since the first settler penetrated its fastness.

Still the wonder and admiration of the tourist and sportsman, the Tobique valley proved a bonanza to the lumberman and it now comes to the front as the choicest agricultural section of this province.

The valley is the seat of the largest lumber company operating in Eastern Canada. Here also is the largest farm in the Province and to this district belongs the distinction of having grown the largest and most valuable crop of red-clover-seed ever produced on a Maritime Province farm. To this farm, the theme of this story, situated a mile or so below the "Gulch" red-clover proved a mortgage-lifter — and then some.

Scotchmen never were daunted by a difficult prospect and it was natural that the husbandman's task to Victoria County should have been shouldered largely by Scots.

How well they succeeded since the founding of the colonies of Kincardine and Kintore in1873 in subdueing the rugged surface of this Caledonia of New Brunswick may be inferred from the fact that Victoria tops the list of all the counties in the production of the special cash crop for which the Province is famed. Victoria County potatoes form the bulk of the export trade of this product.

Specialty Cropping Systems

The initiative and perseverance of her people known no bounds. To excel Aroostook County, which won fame through the adoption of a cash-crop system of farming, is the ambition of her farm owners who watch the development across the border where the market is the wet-nurse to specialty cropping.

To one man in particular, Mr. Geo. McLaughlin, the tide in the affair came this summer and he caught it at the flood—in the shape of a bumper clover crop which he harvested for seed.

That Mr. McLaughlin is an opportunist by nature is borne out by the story of how he essayed to "corner" potatoes—for he knows potatoes as well as how to grow them—on the tight little island known as P. E. I. Well, George and a trusted agent spent a busy week among the island farmers and bought all the potatoes in sight—above and below ground—paying a cash deposit to each grower. Then he crossed the mainland pleased with the thought of a job well begun. Arrived at his potato house ,a telegram sent by his agent informed him that buyer No. 2 was hurriedly rebuying these potatoes at an advance price and the farmers besought him to take back his money. A "slump" was due. The reply was "gather up your money." Buyer No. 2 went broke and George had gained a tour of the Island for the price of a round-fare ticket.

A THRESHING SCENE IN THE TOBIQUE VALLEY DISTRICT

The straw-stack is the residue of three thousand four hundred bushels of grain threshed from one barn.

Bees as Husbandmen to the Clover Blossosm

When the writer visited "Red-Clover Farm" about the first of August, the clover field was a sight to gladden the heart of a forage crop specialist. Thirty acres of clover 'en bloc' is a gladsome sight, and the bees, those husbands of the blossoms, were buzzing them to some purpose. An apiary of 20 colonies of busy workers belonging to Mr. C. W. Lewis, Perth, paid their attentions to the clover blooms.

My exclamation as we waded through the verdant growth appeared to please the owner. Plainly he was enthusiastic over this evidence of Nature's bounty. I soon learned that my guide had studied the results ot scientific investigation and drawn upon the experience of other successful farmers and had applied his intelligence to the management of this farm. For instance, on portions of the field the mower had been used and the heavy swaths of hay lay in long coils. Those patches that had showed ox-eye daisy were made into hay so that nothing should be threshed that was not free from weed seeds. In other parts of the field the growth was so rank that the clover seemed not unlike pea-vines. Scarcely any blossoms were borne and these few showed no evidence of bearing seeds. These parts too had been mowed down to be drawn to the barn for hay. Over the rest of the field, about twenty-five acres, the blossoms were beginning to turn brown and many flower-heads already felt plump and firm when pressed between the thumb and finger giving abundant evidence of a good seed crop.

Believes in Crop Rotation

To the question—"How such a heavy crop was started," Mr. McLaughlin warmed up and there followed a grand discourse on the subject of his farming.

He bought the farm four years ago, then on the verge of being an abandoned farm. This year it produced one thousand bushels of grain. One hundred acres were under crop, and next year there will be twenty-five acres more. The soil is good—a rich gravelly loam—just the sort of land to respond to a rotation of clover, potatoes and grain. A strong advocate of the use of high grade commercial fertilizers and the application of lime in the form of ground limestone, Mr. McLaughlin is quite anxious that the Government's policy of grinding limestone rock be put into effect in his county.

That a farm can be made productive through the use of a judicious crop rotation, the plowing down of clover sod and crop residues and the application of commercial fertilizers is substantiated here. Live-stock of the beef or dairy type is not a feature. The teams are sent to the woods for winter, returning in the spring well-fed and champing their bits, ready for the hard work of the cropping season.

The Irish Cobbler Potato

Not contented with the dealer's profit only, potatoes are a big item of the farm crops. About twenty-six acres were planted and harvested. The yield of Irish Cobblers was something over 120 bbls. to the acre, which brought the acre profit into three figures. Here the double row horse-hoe was in use. Up-to-date machinery is a noticeable feature of the farm; a Watson Triplex Sprayer, a side-delivery hayrake and hayloader, low-down slovenwagons, self-binders, etc., all the best of their kind. A series of tanks, for mixing the Bordeau, conveniently arranged stood at one side of the yard and the potato crop showed evidence of having been sprayed religiously.

The Clover Harvest

A few years ago the Department of Agriculture installed a huge clover-huller and for such a crop as that grown at Redclover Farm it proved its excellence. Twenty-five acres of heavy first-crop red clover meant some threshing and Mr. McLauglin early filed an application with the Department for its use.

The clover crop was cut and bound with a self-binder machine and after becoming well dried in the field was drawn to the barn under cover. Then one fine day the work of threshing began. The capacity of that machine was a surprise to the curious who gathered around, while the way the plump purple seed poured out in a steady stream was truly gratifying to him who had sown, watched and waited, when at the end of six days the threshing floor was cleaned up and the whole product of seed weighed, thirty-five hundred pounds was indicated by the scales.

Nor is that all that may be said. Since the war-period began the price of clover seed has advanced 300 per cent. and the sharpest advance is yet to be.

Now, a scientific fact in closing and that is that New Brunswick home-grown red clover seed is worth a good deal more than the imported seed and even at no greater price than fifty dollars a bushel. Mr. McLaughlin will net a tidy sum for his clover seed-crop, the result of his initiative venture.

The Tobique valley has bright days ahead, for its acres can grow this hundred-dollar per acre crop and continue its big business by growing a cash crop which at the same time puts capital into the soil in the form of increased fertility.

Rural Leaders of the Future

Agricultural leaders were never in such demand as they are at the present time. The gradual depopulation of the farms of Eastern Canada and the tremendous trend citywards, which began many years ago, has caused many serious economic problems. Coupled with that came the great war, which accentuated the difficulty and made farming harder than ever, and still the trend continues citywards. The rising generation seems to be dissatisfied with farm life and slowly but steadily they are leaving the farms for work in the city. The result of the whole thing is an increase in the cost of living and a general air of unrest and dissatisfaction. The almost endless chain of strikes that grip practically all Canadian cities is caused by nothing else than that our economic life is unbalanced. There are too many people in the cities both for the jobs available and the high cost of living. That statement may be challenged by some of the more erratic strikers, but nevertheless the fundamental cause of the whole thing is the the high cost of living.

On the other hand the situation in the rural districts has not improved and the same high wages and advanced cost of farming has played havoc with former farming practices. The old systems must give way to the new, and chief of these is co-operation. Farmers now realize that if they are to get the most out of their business they must work together and organize their business similar to the manufacturers and other city business corporations. The demand for leaders in these agricultural movements continues to grow also. Where are they to come from? Certainly it is from the country, but the real work is to pick out the really capable men. This can best be accomplished by having small rural organizations such as farmers' clubs, where rural economics can be discussed. It matters not what form they take and what line of work they follow, they are bound to bring forward men and women who are capable of becoming leaders in the new environments and lines of thought. Such people are not scarce and there is no community but has a few such persons, but the real work is to discover them. Here is where the local clubs or gathering does a most useful work, and, after all, if they do no other good than to bring out a few real leaders their work has been worth while.

Co-operation and united enterprises are bound to continue as leading factors in our agricultural industry, and the call for leaders is sure to become an ever-increasing item towards their prosperity. Therefore we would advise organizations, and support any gathering of rural people that will help to bring out the latent talent and leadership that is lying dormant in every community. Boost your local club.

Gleanings From the Nova Scotia Agricultural College

A MARITIME COLLEGE OF AGRICULTURE

The Nova Scotia College of Agriculture opened its classe for the term of 1919-20 on November 4th, with a splendid body of students. The Senior class numbers 28, the Junior class 63. The size of the latter points to a much larger attendance next year. The number of regular students is the second largest in the history of the College. When we add the special class for soldiers, the total is the largest yet.

An analysis of the records of this year's attendance brings out some interesting facts. One student hails from Scotland, one from England and one from Ontario. Nova Scotia contributes 48, New Brunswick 24 and Prince Edward Island 15. In other words, 50% are from Nova Scotia, 26.3% from New Brunswick and 16.5% from Prince Edward Island. The ratio of students at the College to the total population is highest from P. E. Island, second from Nova Scotia and third from New Brunswick.

A simple and obvious deduction from this is that the College at Truro is now the de facto Maritime College of Agriculture. It provides agricultural education for all three Provinces and the proportion of students from each of the three is about what an outside observer would expect in a Maritime Institution of this kind. Doubtless the total will grow from year to year, and there will be variation in the number hailing from each Province.

All this brings up a question that has often been discussed before, and one that now should be issued as speedily as possible. Why not make the College at Truro a Maritime Institution not merely with respect to attendance, but also with respect to support by the three Provinces? Various bodies have already made declarations pointing in this direction. oFr example, the Dairymen's Associations in all three Provinces have declared themselves in favor of a Maritime Dairy School at which the splendid work now being carried on in a small way at Truro could be greatly enlarged through the better equipment and more extended sources of instruction.

While there is an excellent plant at the Nova Scotia College, and while it is true that the efficiency of its work has been constantly demonstrated by the splendid records of graduates who have continued their studies at Guelph and other Colleges, yet the equipment is much more modest than that of any other College East of Saskatchewan. It is too obvious to require argument that the other two Provinces would be doing their agricultural interests an invaluable service through their own students by making it possible to add to this equipment.

Your corespondent has discussed this matter with Dr. Cumming, Principal of the Agricultural College at Truro, and finds that he is himself very favorable to the participation of all three Provinces in the support of the College and the moulding of its policies. He would go so far, indeed, as to be willing to make any necessary change in the administration of its affairs so as to bring about this end.

Maritime union is a subject that has received a great deal of attention from time to time. It may be that such a union is not practicable along all lines of administration, but, so far as Agriculture is concerned, the interests of the three Provvinces are one, and a policy of Maritime union could easily be worked out. Its desirability is beyond question.

THE DOMINION EDUCATIONAL BUTTER SCORING CONTEST

The Dairy interests of Canada are spread out over a huge territory, and, while good butter is being produced East and West, and all the way between, there is always the possibility of a wide divergence in flavour and quality. This fact has been a drawback in foreign markets in the past, as "Canadian butter" might mean anything. The Dairy Division at Ottawa has for some time been considering ways and means of standardizing this product throughout the Dominion.

During the past summer there has been carried on a butter scoring contest by the Department at Ottawa in co-operation with the Dairy Division in each of the different Provinces, the Province selecting the creameries which should compete, and the Federal Dept. conducting the contest.

Four creameries from each Province were selected. In Nova Scotia the four which stood highest in the 1918 Provincial Competition were chosen. Every month during the summer each creamery sent a fourteen lb. box to cold storage in Montreal, where it was scored by three experts on arrival, and then scored for flavor each month during the season. The final scoring took place in Montreal two weeks ago. To get all possible results from the whole undertaking, the Dairy Commissoneir at Otawa invited representatives from each Provincial Department to be present at these scorings.

To further the standardization of quality, samples of this butter arranged in series, good, bad and indifferent, pasteurized and unpasteurized, etc., will be sent down to the various Dairy Conventions during the coming winter.

A big change has taken place during the past few years in the quality of creamery butter. Butter which would have passed ten years ago as the finest, would not be passed today at all by a close critic. The Dominion Education Butter Scoring Contest gave the leading Dairy authorities in the various provinces a chance to make carcful comparisons between their respective products. Thus a medium has been established through which all the provinces may work toward a common standard.

While this contest was not conducted with any idea of setting one area against another, and while no prizes were offered to the competing creameries, yet it will b encouraging to the Maritime Provinces to know that their product is at present scoring as highly as any in the Dominion. In the last test the highest score was made by a Prince Edward Island creamery, which reached the fine total of 98 points. The highest record made by the other Provinces run as follows: Quebec 97.8, Nova Scotia 97.5, Manitoba 97.2, Alberta 97, New Brunswick 95.6, Saskatchewan 95.2, British Columbia 94.4, Ontario 94.

It is purposed that this competition shal lbe carried on during the season of 1920, and it will be followed with great interest by dairymen in all the Provinces.

WHY NOT RAISE MORE SHEEP IN NOVA SCOTIA?

Every one who visits the Province of Nova Scotia is impressed with its possibilities in sheep raising. The fact remains that this idustry has not developed to as great an extent as had been hoped for, and as the situation would seem to warrant.

In the past several reasons have been advanced for the comparative failure on the part of farmers to take advantage of the "Golden Hoof." Among those the one most frequently urged was the dog nuisance, and representations were made that if drastic legislation regarding dogs were brought about, great improvements would result. There should now be little room for complaint on this score.

Under the legislation at present in force, any person may shoot a dog at any hour of the day or night that is in any way worrying his sheep. In addition to this provision, a tax of not less than $1.00 per annum must be paid for every dog, and, not less than $5.00 for a bitch.

The revenue produced by this tax according to the law, "Shall constitute a fund for satisfying such damages as arises from dogs killing or injuring sheep in the municipality, in cases where the owner of the dog is unknown or unable to pay." Sheep owners who suffer loss or injury by dogs of which the owners are known and are able to pay have resource to the comon law of the land for the collection of damages. Several cases have been reported to the Department of Agriculture of sheep owners rcovring losses sufferod by dogs of which the owners were unknown. It is reasonable to suppose that others who have not been reported have been recouped in the same way. It may be, however, that there are still farmers who are not aware of these provisions of th law. The whole matter is clearly set forth in the 'Statutes of Nova Scotia, Acts of 1908, chapter 26, being "An Act to amend the Sheep Protection Act."

This, however, is not the whole story. Even at the time when the agitation against the dog nuisance was at its height, there were many who said that the reason for Nova Scotia's failure to develop the sheep raising industry lay deeper than this. There was the necessity for more careful fencing, the unsatisfactory prices for the products, and the other incidental difficulties attending this or any other branch of Agriculture.

It may be that something further should be done to help obviate these difficulties, just as the dog objection has been very largely removed. The Department is anxious to encourage sheep raising in Nova Scotia, and the Secretary for Agriculture would like to hear from those who are interested. If you have a sugegstion, pass it along. It must be admitted that some development took place during the war period. It would be unfortunate if such gains were now to be lost, or even if the business ceased to increase. Sheep raising should be one of our great assets in this Province, and with a cold storage plant in prospect, and co-operative marketing of wool and lambs gaining headway, marketing uncertainties will be reduced to the minimum.

The whole subject is a good one to discuss at Farmers' meetings through the Farm papers,by letters to the general press, etc. Think it over. Talk it through; and if you have a proposal to make,write your views down and send them in to the Secretary for Agriculture, Truro, N. S.

HOME GROWN SEED GRAIN

During the past ten or more years, the Provincial Department of Agriculture in Nova Scotia has conducted a Field Crops Competition. The main purpose of this was to encourage the growing of seed oats and wheat especially, at home, instead of buying outside the Province, as the prevailing custom has been. It was very fortunate during the years of war that this practice had been instituted far enough in advance to get a large proportion of our farmers into the way of growing their own seed. Nothing else saved the seed grain situation in a time when it was practically impossible to buy good seed in the usual markets of the world.

While the war was on a large number of fanning mills were purchased by the farmers of the Province. A bonus was paid by the Department to buyers of these machines during 1917. Such good results have followed from the use of home grown seeds that the practice is likely to be established.

The Department, however, is not yet satisfied, and in announcing the prize lists for 1920 it plans to confine competitions entirely to fields sown with registered seed. This registered seed is available from members of the Canadian Seed Growers' Association, and also from a number of men who have participated in the Field Crops Competitions. There will be difficulty in obtaining it if farmers put off ordering their seed supplies until nearly seed time.

aFrmers who plan to enter the Field Crops Competition, and who do not know where to obtain registered seed should correspond at once with the Department of Agriculture and secure a list of persons from whom seed can be secured. Further reference to this matter will appear in the Press later in the season .

MODEL ORCHARDS

It may not be generally known that the Horticultural Division, N. S. Dept. of Agriculture, maintains and oversees some twenty-four Model Orchards in various parts of the Provi ice. The main objects of these are, to demonstrate the adaptability to fruit, raising of districts which are outside the fruit belt proper, and to test the diffierent varieties so as to discover which are most suitable to the conditions prevailing in these districts.

At the Poultry Show recently held in Halifax, samples of apples from sixteen of these orchards were on exhibition. These were taken from districts scattered over the whole Province from Yarmouth to Cape Breton.

These samples were of very high quality, and of a wide range of varieties. Even the casual observer could not but be struck with the possibilities of districts which have never been regarded as suitable to apple growing.

The next Annual Convention of tne Dairymen's Association of Nova Scotia will bc held at the College on the 22nd and 23rd of January. All who are interested in creamery work will be pleased to learn that a series of samples will be on exhibition from the Dominion Educational Butter Scoring Contest at Ottawa.

MARITIME POULTRY ASSOCIATION ANNUAL

The annual meeting of the Maritime Poultry Association will be held at Amherst at the Winter Fair, at the Board Room at 10 a. m., Wednesday, December 17th.

The date for the Nova Scotia Poultry Association meeting has not yet been fixed.

The revival of the Winter Fair this year should result in a largely increased attendance of members of the Poultry Association.

The most carefully planned farms are carrying more cows for a given area than are the farms where there is no regular plan followed. By careful planning a man is enabled to have a perfect balance of everything. Under a carefully worked out system of cropping the farm does not run short of feed at any critical time.

Jottings From the P.E.I. Department of Agriculture

The demand for pure bred rams in the Province of Prince Edward Island is growing stronger each year. The Department of Agriculture during the present season distributed a considerable number of imported rams, which were carried over from last fall on the Government Farm. These rams were one and two years old, good individuals and in splendid breeding condition. They were readily disposed of to breeders throughout the Province. Many orders which could not be filled by the Department were referred to local breeders who had rams for sale, and in this way it is hoped that all demands will be fully satisfied.

The present interest in flock improvement has been growing for some time and is due principally to the education resulting from the co-operative selling of wool as well as the results noticeable in grade flocks where pure bred sires of the right type and quality were used. There is no question that the quality of the wool and the quality and quantity of mutton can be very materially increased by crossing the farm flock with an individual of strong blood lines and proper conformation. Instances have been noted in the Province where the first cross on grade flocks by pure bred rams has increased the average weight for the whole community to the extent of from 10-15 lbs. per lamb. Not only is the weight increased, but the lambs will be of a better mutton form, more uniform in appearance and will present a much more attractive proposition to the buyer than the ordinary stock of indiscriminate breeding.

It is estimated by an expert at the Live Stock Branch at Montreal that farmers suffer more loss each year through the use of scrub sires than can be gained under the most improved system of marketing. The stock yards are placing a premium on quality and a discount of from three to four cents per lb. is being placed on the scrub stock. If we could only impress on the mind of the sheep-raiser, who is using the scrub sire on his flock, the actual amount in dollars and cents he is loosing annually by such a policy, there would be no doubt that more attention would be given to the proper selection of a head for the flock. The difference in price between the scrub and the sire of individuality and character is so little as not to constitute a difficulty in the way of procuring the very best rams.

The P. E. Island Egg and Poultry Association have recently paid 26 cents per lb. live weight for fat fowl marketed through the Association during midsummer. A splendid return for this class of fowl and in comparison with the market quotations, a most satisfactory one to those who have taken advantage of co-operative marketing, and should be an inducement for all farmers to market their products as far as possible in this manner.

All those within reach of co-operative creameries are aware of the benefits of this system of manufacturing and marketing their dairy products, as the price of creamery butter will range from 5 to 10 cents per lb. over the home made product, and the gain in overrun in a ceramery is also of considerable value.

Selling wool through the Wool Growers' Association has resulted in an average price of at least 10 cents per lb., and up to 15 or 20 cents per lb. of an advance in price for the better grades of wool over that paid in the open markets.

The results of the egg circles has revolutionized that industry. In fact it is only by standardizing any product and selling co-operatively that the best market may be procured and retained.

As an example of this, the fruit growers of the St. Lawrence Valley, the home of the most popular desert apple, received $3.00 per barrel more for their No. 1 product the first year after they organized their first Growers' Association and standardized their product, than was paid outside the organization.

We must first guarantee the quality; then through co-operative selling we can command the top market price for any of our farm products.

The Department of Agriculture, through the Rural Science Branch, is encouraging the boys and girls of the public schools to take a greater interest in poultry. The method followed in 1918 was to organize school poultry clubs at school fair centres. The objects of the clubs were:

1. To stimulate an interest in poultry raising among the people of the province.
2. To give a better knowledge of the value and importance of the poultry industry, and in marketing of a first class product.
3. To teach better methods of caring for the poultry and eggs.
4. To show the increased revenue to be derived from well bred poultry where proper methods of management are pursued.
5. To encourage the child to become a producer early in life.

The members of the club decided upon one particular breed of poultry. Each member purchased a setting of eggs from the Rural Science Department. These eggs were from pure bred selected flocks. Unfortunately the pupil did not always receive the eggs in good condition and as a result experienced poor hatches.

To overcome this and to give the members a better prospect for building up a flock, the Department installed a Mammoth Incubator with a capacity of 2400 eggs. Two incubators of the same type were installed by the Co-operative Egg & Poultry Association and a man engaged to operate the three machines. The eggs were all secured through the Association, and only those used which were from selected flocks. The announcement was made to the schools that day-old chicks would be delivered to the clubs first making application. So favorably was this announcement received that in all 12,000 chicks weer ordered. The Department followed its regulation, and those first ordering were supplied. Hundreds of pupils were disappointed because of our inability to fill the orders. The experience gained will enable us in next year's operation to avoid many of the errors made. The boys and girls exhibited their poultry at the school fairs, and at the Provincial Poultry Show held in Charlottetown. The experiment has already shown that it is worth while to work through the schools.

If we wish our boys to leave school for the farm keenly interested in live stock, it is necessary to begin educating them along these lines at the impressionable age. The various ways in which this education is carried on n some of our schools, and the practical results obtained is sufficient evidence that a greater effort should be made to have all our rural schools actively interested in leading our young people to see the prosperous future open to intelligent farmers, that the greatest prosperity rests on the development of our live stock industry.

1919 New Brunswick Field Crops Competition

QUEENS COUNTY	Wheat		Oats		Potatoes		Turnips

An additional three dollars and two dollars goes to the first and second highest scores respectively in the wheat and oats classes, when samples of the threshed grain are shown at the Provincial Seed Fair, Fredericton early in 1920.

ECONOMY IN FEEDING

Every animal is by nature endowed with a chemical laboratory suited to its needs, and animals on a first class pasture are able to provide themselves with a perfectly balanced ration.

A perfectly balanced ration returns perfectly balanced values in food products. The milk will contain a proper proportion of bone, flesh, muscle, flavor and nerve producing qualities as well as the fat producing. And milk as a perfect food must not have one quality above normal at the expense of some other quality. Butter fat alone should not be the base of value.

The perfectly balanced ration ensures not only balanced milk values but also the maintenance of the animal in perfect health, every part being fully nourished so that all values are perfectly balanced, the meat being healthy, tender, fine flavored, juicy and nutritious.

Very little if anything in the way of expensive meals or grain is given to animals on a good June pasture, but results secured are all that can be desired. etY with the exception of the aromatic values which have passed off in the ripening and curing processes all the food values are in the hay.

Hay, straw, corn-stalks, fodder-grasses and coarse grains have all the needed food values with the exception of the aromatic qualities of the June pasture. Furnish the animal with an equivalent for these aromatic qualities and your roughage and coarse grains will be converted by the animals into a balanced ration, and you will save expensive grains and meals.

During upwards of thirty years Herbageum has proved to be the efficient and economical aromatic equivalent required. Economical because one pound costing 25c is sufficient for a horse, or a cow, or a hog for one month given twice daily, and one third the quantity is enough for a calf or a sheep or for about fifteen fowls.

It is profitable to use Herbageum regularly for all classes of animals and for poultry. It keeps sheep free from ticks so that sheep dips are not required. Besides the wool clip is heavier and of better quality when sheep are fed Herbageum. Adv.

DAIRYING.

WHEN A MAN BUYS A BULL THE FUTURE OF THE HERD IS AT STAKE

The bull on the dairy farm is generally looked upon as a necessary evil. Certainly he is not kept on account of his sociable disposition or because his owner needs some means of disposing of feed. He is unquestionably a nuisance, but at the same time the future prosperity of the owner depends to a large extent upon what is wrapped up in the bull's hide. Over a hundred years ago one of the greatest cattle breeders that has ever lived said, "The bull is half the herd," and every great breeder since then as he has looked back over a successful career has affirmed the correctness of this statement.

The objective of the dairy farmer is of course the largest possible milk production at the least expense. The success of his efforts in these resepcts will depend largely upon two things: The first is the efficiency of the machine used—in other words, the capacity of the cow to give milk if given a chance. The essential points to be observed in getting the efficient herd are getting the cows with the best possible inherited tendency to give milk and constantly culling out those found by trial not to have the right heredity. In other words, selection and breeding, as long recognized, have to be depended upon to provide a satisfactory machine for the dairyman to use.

The second factor involved is how skillfully the machine at hand is used, and includes feeding and management with all the important details these subjects include. The present discussion, however, is concerned only with the question of getting the efficient machine, the high-producing cow, and really with only one phase of that question.

The question of getting efficient dairy cows for immediate use is largely a problem of selecting the individual. The question of having young stuff coming on of such quality that the herd will increase in production from year to year is mostly a breeding question.

It is generally conceded that, taking all our dairy cows into account, we have to raise at present three cows in order to get two that are satisfactory. In other words, about one-third of the cows raised for dairy purposes are culled out as unprofitable when records are kept. This results in the loss of much good feed, not only in raising these unprofitable animals but in keeping them until their worthlessness is proved and they can be culled out. The objective point of our breeding operations should not be to raise one or two great producers. I look forward to the time wheu, as a result of more skilful breeding, instead of only two or three cows raised being satisfactory, four out of five will be up to standard and later possibly even nine out of ten.

In considering how the proportion of good cows may be increased the first question that has to be settled is this: Is the good cow or the inferior cow born what she is, or made what she is by the feed received and the management when young? I can only take space to say that as the result of an experiment covering nine years, during which no small sum of experiment-station money was spent, we came to the conclusion that the high-class dairy cow or the inferior cow is born that way. She is not made what she is by any special ration or treatment received when young. In fact, with the limits of ordinary practice, the manner of feeding and managing the growing heifer has little if any relation to the efficiency of the mature cow as a milk producer.

If the difference between a cow having a capacity of 10,000 pounds of milk a year and another that barely reached the 4,000-pound class is one of parents, it certainly behooves the dairy farmer to see that the proper parents are provided. It should be remembered that the cow has two parents and both should receive attention. The tendency is evident, especially in recent years, since the keeping of records and the culling of cows

A "renewing" bath —for your bathroom

FLOORS! Walls! Enamel! Bowl! Tub! Of course you want them always ready for inspection! Gold Dust leaves bathrooms with a sanitary sparkle because it purifies as it thoroughly cleanses. It brings a wonderful sweet cleansing to bowls and drainpipes. Be sure to keep a package of Gold Dust in your bathroom —handy for frequent bathroom cleaning!

Look for the Gold Dust Twins and the name FAIRBANK'S on every package.

has been so strongly emphasized, to count too much upon this culling of inferior cows to improve the coming generation. By all means, raise the heifers from the best producing cows, but do not count too much on these heifers duplicating the records of their dams in milking ability.

At one time I made a careful study of the record for twenty-five years of the Jersey herd belonging to the University of Missouri with the object in view of finding out what relation existd between the milk records of the dam and of the daughters.

The results were disappointing. In fact, the daughters of the best cows averaged only slightly better than those from the medium-producing dams. However, when I studied the records of the daughters from the standpoint of the sire the results were striking. Apparently the sire had more to do with the dairy characteristics of his daughters than did the dams of these daughters. This bears out an opinion that has been held by many practical breeders of dairy cattle to the effect that the sire is a more important factor than the dam in transmitting dairy qualities.

Some among those interested in studying animal breeding from a strictly scientific tsandpoint have also suspected this to be true and that milk production is what they term a sex-linked character. Though it is still to be definitely proved the bull is a stronger factor than the dam in transmitting dairy qualities, the probability of this being true adds to the importance of the bull question.

In fact, the more a man studies the question the more he realizes that the whole future of his herd is at stake when he buys a bull. To use a bull with the wrong combination of heredity in a good dairy herd is almost as great a calamity as to burn down the barn. Two or three of the wrong kind in succession will almost put a pure-bred herd out of business, while the right bull may make a herd famous.

If we study the history of any successful breeder we generally find that this success was based upon one or more great breeding animals. This was true as far back as the time of the Collings brothers, the great Shorthorn breeders of the eighteenth century.

Valancey Fuller, in his history of the St. Lambert family of Jerseys, credits Stoke Pogis 3rd as being the main factor in making his family famous. This wonderful bull, like many others, was not appreciated until too late. While an agent was actually on his way authorized to pay $1,000, if necessary, to buy this bull, his owner sold him for $30 to a butcher.

Pontiac, Michigan, at least in so far as the agricultural public is concerned, was put on the map by that wonderful breeding Holstein, Hengerveld DeKol. This bull of good breeding, but with nothing remarkable so far as his ancestry shows, in my judgment was the greatest breeding bull of recent times. When his daughters came into milk, even under the unfavorable conditions unavoidable in the public institution where they were owned, the records were so outstanding that their sire became famous. In this case, fortunately, the bull was retained until his great breeding value was recognized. Today a good proportion of all the record cows of the breed and of the high-priced animals of the Holstein breed carry the blood of this famous sire.

Shorthorns

ALL HERDS NEED GOOD BULLS

The other day a man from a far distant state came into our office. He had located a dozen purebred heifers. He solicited advice about buying them.

To answer we needed information, so asked: "What are you going to breed them to?" The answere resulted in friendly argument and this ended with the following statement: "I am going to buy just six of those heifers and put the rest of my money in a good bull to breed them to."

Sometimes we wish it were ethical to gamble and this is one of the times. We would gamble a lot that this one decision will account for the man from the far distant state breeding a phenomenal herd of cattle instead of a bunch of common things like he would have bred had he put all his money in females and then mated them with just a common purebred bull.—Kimball's Dairy Farmer.

EXPORT TRADE IN DAIRY PRODUCTS ASSURED

It is the consensus of opinion of Canadian officials who have visited Europe that the future of the export trade in dairy products is assured. In England butter is everywhere at a premium and Canadian cheese continues to hold its good reputation. Mr. H. S. Arkell, Live Stock Commissioner, who has recently returned from overseas, states that the shortage of milk and dairy products in Great Britain is unprecedented. The same is true of other European countries. The scarcity and high price of concentrated feed is to some extent responsible for this. The condition is so general as not quickly to be remedied. It is further responsible for retarding the increase of swine production and the restoring of the normal requirements of fat. This statement from the Live Stock Commissioner should give confidence not only to dairy farmers but to those who are able to raise hogs.

Breeders should co-operate in the stamping out of tuberculosis and abortion. These two diseases exact a heavy toll in Canadian herds every year. The individual breeder may keep his own herd tolerably clean, but it requires the co-operation of all in the fight to rid the country of the enemies of our herds.

LOUDEN

LIVE STOCK.

LIVE STOCK NOTES

As a further contribution to the elimination of the scrub bull, the Dominion Live Stock Branch has this year purchased and loaned to farmers' associations three hundred and fifty pure bred bulls. Over two hundred of these sires were placed in Western Canada, which has for years taken full advantage of this policy of the Branch. Thirty-six bulls went into New Ontario, sixty-two into Quebec, and the remainder to the Maritime Provinces. New Brunswick this years led all of the provinces as regards increase over previous years in the number of applications. This was the result of active steps taken by the Provincial Department of Agriculture through its field officers to encourage and assist in the forming of the necessary associations.

Mr. R. S. Hamer, who as Chief of the Cattle Division of the Branch, has administered the bull loaning policy since the time of its inception in 1913, states that, as a result of his experience in securing upwards of twenty-five hundred pure bred bulls of all breeds, he is convinced that the greatest meance to the success of the anti-scrub bull campaigns now being pushed so strenuously in various parts of the country, lies in the deplorably large percentage of inferior pure bred bulls which are annually offered for sale. Such bulls are dear at any price and will only prove a source of disappointment to those who purchase them to replace grade or scrub sires.

Unfortunately, as has been amply demonstrated during the past three or four years, an increased demand for pure bred bulls of the commercial class to go into grade herds does not result, as is so often claimed, in an immediate improvement in the standard of this class of bulls offered for sale. In fact, the tendency is to retain for sale for breeding purposes bull calves which would otherwise have been castrated and finished as steers. In so far as our beef breeds are concerned, th responsibility for the inferior quality of so large a percentage of the annual pure bred bull calf crop undoubtedly lies in the fact that too many of the smal pure bred herds from which our comemrcial bulls are annually drawn are themselves headed by ordinary commercial or second rate bulls. Many of these herds consist of good substantial, although perhaps plainly bred females. If higher class sires were placed at their head, a marked improvement in the quality of the annual calf crop would undoubtedly result. It is contended, therefore if any real success is to be attained in attempting to secure a wide-spread displacement of scrub bulls by pure bred sires, breeders must, without further delay, centre their attention on developing a market in our smaller pure bred herds for the majority of the high class young bulls annually produced and imported, for too many of which an outlet is now found outside the country.

From January 1st to October 17th inclusive, of the present year, 689,722 cattle were offered for sale at Canadian stock yards. Of that number 212,333 head were cows and heifers.

From January 1st to October 17th inclusive, of last year, 604,504 cattle were marketed and of that number 168,552 head were cows and heifers. The above information discloses the following facts:

During the first nine months of 191h marketings of feamles totalled over 43,000 head in excess of those marketed during the same period of the previous year.

On the basis of total cattle marketings during 1919 and 1918, there was an increase of 2.9 per cent .in 1919. The percentage of females in 1918 was 27.88 and the percentage in 1919 was 30.78. The figures given do not include cutters and canners as these may be considered potentially useless.

The feed shortage is undoubtedly compelling a general continuous liquidation in all parts of the country and much she stock and growing calves are being drawn into the net. For example,, there were marketed in Winnipeg during the last four weeks, 4,349 hardy, thrifty, beef-bred calves. It may clearly be necessary for farmers everywhere to square away but good young heifers and cows are the seed from which Canada is to reap her harvest. The demand in Europe is now coming to a head and if it is possible at all, considerable sacrifice to save them will be well worth the cost. Mr. McCurdy, Parliamentary secretary for the British Ministry of Food, says that there is not enough meat in sight in the world to feed Europe next year.

The policy of Federal assistance to Horse Breeding, which went into operation in 1915, has steadily grown in favor among breeders. That the scheme is popular is quite evident from the steady growth in the number of Clubs, which is prima facie evidence that gfood results are being obtained.

The Chief of the Horse Division of the Live Stock Branch reports that already requests are coming in for Federal Assistance Booklets and the necessary forms required when starting a Club. The new booklet for the

Production Plants on the Hills

Farms, their owners call them—*just farms*

Not so, the student of modern business spending a few weeks in the country. He views Canadian agricultural methods and equipment with amazement, and calls them Production Plants.

In lands and fences, plows and reapers, he sees the modern production plant and its machinery; in dairy produce and grain—its stock-in-trade ; in automobiles, phones and fountain pens—the connecting links.

Waterman's Ideal Fountain Pen

plays an important part in modern farming. Its unfailing readiness to write everywhere and anywhere, is an indispensable convenience—no searching for the pen—no throwing out a rusty nib—no looking for the ink—but always at hand—carried safely in any pocket.

Waterman's Ideal Fountain Pen is always ready, and peculiarly your own. More and more each day it becomes part of you—it takes on your peculiarities and adopts the individuality of your hand. It takes the bother out of writing, saving time and ink, and enables you to do better work. It is "The Tool Essential."

MORRIS SCOVIL & SONS

It is mighty hard to get help in these days. It would be a great help if the boys could clean the stable. They hate to do the job with a wheelbarrow. It is hard work for a strong man.

It is a very different matter with a BT Manure Carrier. There is no heavy pushing, no planks to lay, no snow to shovel. The work is done in half the time. If the yard is muddy or filled with snow, it doesn't matter because the overhead track is independent of conditions on the ground.

And what about the boys? Mr. C. Hanson of Dixville, Quebec, wrote us "I used to have to drive the boys to clean the stable, and now they fight with one another to get hold of the carrier." Send for our Manure Carrier catalogue and judge for yourself how much labor and time a BT Carrier will save you.

year 1920 is now ready for distribution. Districts intending to form Clubs should write for a supply of these booklets imediately. Those that start early get the work of goranization over during the slack season and are then ready to send Applications in before April 1st, which is the final date for receiving same. These Clubs have the advantage over those that organize later in that they have the pick of the best horses. Good stallions that are not hired early are invariably routed early in the year, thus late comers are forced to take what are left. It is also amongst the horses hired late that most of the animals not up to the required standarde are found, hence the advisability for Clubs to select early. Undoubtedly it will only be a matter of time when the best horses will be hired at least one year ahead, and, in many cases, two and even three years as is now the common practice in Scotland.

The total sales of live stock at Canadian Live Stock Yards during the first ten months of the present year show an increase of 114,800 calves, 191,000 sheep, and a decrease of 6,600 hogs when compared with the sales during the same period of 1918. A very large percentage of the increase during the period mentioned was made during the months of September and October, while the total decrease in hogs was appreciably lessened by the heavy marketings during the two months referred to.

During the month of October there was an increase in live stock sales of 6,100 head of cattle, 15,500 calves, 3,451 hogs and 70,049 sheep, when compared with the sales during the same month of 1918. Despite the increased volume of cattle, the average price on good weights and quality steers was only one cent per pound less than the average for the same class of cattle during October 1918, while the average sales of good quality calves were made at three quarters of a cent above the averag obtaining during October 1918. The tremendous increases in sheep marketings reduced the average of good lambs by about three cents per pound. In the case of hogs it is of some interest to note that the market for hogs during October, despite the heavy marketing at that period, was lower by only one and one twelfth cents when compared with average price during the same month of 1918.

Aside from the problem of the scarcity of feed, the comparison as shown between the volume of receipts and market prices warrants confidence in the live stock industry .

The following extract is from a letter just received from the head of an importing firm in Paris:

"Some friends of mine now seem well disposed to enter into the business. They intend to import for Belgium and North of France through Dunkirk and Antwerp. Animals are specially wanted for milk purposes, and my friends want to know the breed of proposed cattel, also the average production of a cow. It is suggested to send young cows in state of pregnancy for some months, in order to avoid accidents during the voyage. If prices are suitable, we may buy several thousand head of cattle. Payment will be effectuated by bank credit opened in New York or Montreal when giving the order, money delivered against bill of lading."

Copies of the letter are being addressed to various firms and parties likely to be interested in this business and our correspondent will be forwarded the information he asks as soon as it can be obtained.

Our Markets Representative at one of the Stock Yards reports that during the week end October 9th there were over 15,000 sheep and lambs on the market. He graded over 8,000 of these and estimates that there were not more than 300 wethers in the lot. He quoted several instances of lambs

With Bacon at Present Prices

most stock farmers are turning their attention to hog-raising. Fine, fat, sleek hogs—the fellows that pull big prices at the market—need

Pratts HOG TONIC

as a fattener and conditioner. Sharpens the appetite, aids digestion, and turns the feed into profitable pounds of flesh.

Saves from 15 to 20 per cent. in feeding costs and saves 30 days' time in fattening. You get your hogs to market just that much sooner, and get the use of the money from their sale ahead of the usual time.

At your dealer's in popular-priced pkgs., also in 25-lb. and 100-lb. bags.

Pratt Food Co. of Canada, Ltd.

328H Carlaw Ave., Toronto. HT-30

Pratts

averaging from 68 to 73 lbs. which sold for 12 cents and of other lots of lambs averaging from 64 to 71 lbs, which sold for 13 cents. It will be noted that the 13 cent lambs were of equal weight or lighter than the 12 cent lambs. Our representative reports that the difference in price was ntirely due to the fact that the good lambs were better bred and that a large percentage of males had been castrated and docked.

From April 1st to September 30th, approximately 100,000 cases of Canadian eggs have been inspected for export and passed. 83,503 cases were inspected for export in Eastern Canada and 10 car loads for shipment direct to Great Britain from Winnipeg. In addition to the above, 70 cars moved from Eastern Canada under inspection to Montreal, 19 cars to Toronto, 83 cars to British Columbia and 60 cars inter-provincially between the Prairie Provinces.

It will be remembered that eggs cannot now move interprovincially or for export except under government inspection and in accordance with Standard grade. British importers have strongly commended this action on the part of Canada and give it as their opinion that it will go far to establish Canadian eggs on the British market as eggs of uniform and dependable quality. Our eggs now command a steady premium over United States product and export movement for October promises to be exceptionally heavy provided space can be obtained.—Dominion Live Stock Commissioner.

"The future prospects for the farmer who holds his good stock and builds up his herd are more promising than ever before."

Bare land loses plant food easily. Keep a crop on your light land constantly and turn under as many of the crops as possible.

FARMERS---Will You Write a Letter for Seventy-five Dollars?

In order to secure first hand information of the experiences of successful settlers in Canada, the Department of Immigration and Colonization of the Dominion Government offers

$1,350.00 in Cash Prizes

for the best letters or articles setting forth settlers' experiences in "making good" in Canada. Three prizes of $75.00, $50.00, and $25.00 are offered for each Province.

Try this Competition

There is no entry fee. Literary style, spelling, etc., are not essential. The main thing is the story—the story of your success told in such a way that it will be a help to others who may contemplate settling in Canada.

Competition closes February 14, 1920

For full information see notice in your Post Office, or write ROBERT J. C. STEAD, Director of Publicity, Department of Immigration and Colonization, Ottawa.

THE HORSE

WINTER CARE OF COLTS.—FIRST YEAR IMPORTANT

To produce good horses we must look to their welfare from start to finish and there must be no vacation from good care and feed. In the first year of life of the colt we are laying the foundation, building the framework, so to speak, on the lines of architecture we laid out when mating the dam. No matter how well bred the colt may be it must be well developed by proper feeding and management. The plan of the architect must be carried out and this can be done only by keeping the colt in a healthy, growing condition. The colts will grow all the winter through and weigh at one year old from 900 to 1,200 pounds. It is said that a colt is half grown at one year, so a 600-pound yearling will never make a proper draft horse.

What does the colt require First, we may mention exercise. This is, we may mention exercise. This is very essential for the proper development of the body and limbs. During the past few months the youngster has been accustomed to the free range of the open fields. He has exercisd at will on th cool, moist ground so well suited to the best development of his feet. He has nibbled at the tender grass and sought out the sweetest knolls in the pasture. But now he cannot partake of the tender grass, and if kept confined in a box stall as many a colt is during the winter, he is deprived of the necessary exercise which he found great delight in taking and which was immensely helpful to him during his freedom in the pasture.

A colt should have at least five hours' run in a large, open yard every day in the winter that the weather will permit. An all-day run is better still . Too often, even where outside exercise is given regularly, sufficient is not allowed, the colts being left out only an hour or two each day. This is better than none, of course; but this is a case where if a little does a little good more will do more good. Exercise helps to develop every part of the body of the colt and is necessary to maintain his health and vigor. His feet, legs, muscles and body all are benefited as well as his digestive organs. A colt will take all the exercise he needs if given the apportunity, so let him have the privilege. It is no trouble and costs nothing. It pays just as well as good feeding.

We must do the feeding with a knowledge of requirements and keep in mind always that the colt is a young growing animal with a digestive system that is very sensitive to sudden changes of rations and injudicious feeding. No diet is equal to good, sound oats with a moderate mixture of bran twice a day, morning and noon, and oats for the evening meal, being seasoned with a little salt. Whole oats are very nutritious and if properly masticated, as they are generally when fed with bran, are more easily digested than chopped feed of any kind. The hay for the colt should be the cleanest and sweetest obtainable, preferably that containing a large percentage of clover or alfalfa. Pure clover or alfalfa hay with a little timothy makes as good a roughage as can be found. Besides the hay and grain a litle green feed is very helpful to digestion. Carrots or turnips are relished and should be sliced or cut in two before being fed. They are somewhat laxative and help to bridge the gulf between hay and grass. Of course, plenty of fresh water is necessary for three times a day.

The stall for the colt needs to be roomy, light and well ventilated. It should not be too warm. Colts generally have a long, thick coat of shaggy hair which nature intends as a protection and it is a mistake to pamper too much. They will stand very cold weather when outside, provided it is not storming and in side a high degree of warmth is not necessary. The main thing is to keep the stall clean, not allowing manure to accumulate and heat under the feet of the animal, and always affording a liberal supply of clean, dry bedding, wheat straw being excellent for the purpose.

Colts should be guarded against lice and other external parasites. Many a good colt has become very poor in flesh from constant irritation and uneasiness produced by lice and whenever a colt shows unaccountable loss of condition and of thrift, examine him closely for signs of the presence of these undesirable companions. Colts, too, are frequently troubled to a considerabel extent with intestinal worms of various kinds. Some of these parasites are more to be dreaded than others but none of them are desirable guests or in any way beneficial to their involuntary hosts and it is therefore very important to take measures for their removal at once.

W. H. ULMAN.

ROARING, A HORSE DISEASE RATHER DIFFICULT TO CONTROL

A horse that is a confirmed roarer generally has a paralysis of the muscle controlling the left vocal cord and can be cured only by an operation removing this cord. The paralysis of this muscle that controls the cartilage of the larynx is due to a wasting of the left recurrent nerve, which, if in health, would supply the motor force to the muscle. This force being absent, the muscle loses its power and wastes away. Hence, the left half of the muscle drops down, and bars the ingress of the air at each inspiration, which therefore strikes ciolently against the helpless cartilage; hence, the peculiar noise, termed roaring. The cartilage is thus flattened down, and expiration is easily effected, and therefore is free from noise. When noise is heard, both in breathing in and breathing out, it is due to some obstruction in some part or other of the respiratory passages, usually in the larynx. There are, however, other causes for this complaint. Many roarers have been examined after death, and have been found to have no vestige of disease, but some have had the shape of the larynx and upper part of the windpipe materially deformed, crooked, and depressed. This has caused inquiry into other causes of roaring, and some very probable ones have been found. The parts may have been subject to inflammation, and some parts of the air tube may have become thickened and inelastic. In this way the inflammation of stranglers have been communicated to the larynx or the windpipe, followed by some alteration of structure. Roaring is no unusual consequence of strangles.

Roaring Through Tight-reining

A more frequent cause and previously unsuspected, is tight reining. More horses have become roarers through painful pressure on these parts by tight reining than is suspected. This is particularly so with drivers, when teaching them to carry themselves well. The arched neck and elevated head of the driver or draft horse is an unnatural position, from which the animal is always anxious to be relieved. Injury always follows when the throat is violently pressed upon, and especially when it is exposed to the additional danger from impatience of the animal, through suffering the pain that tight reining causes. The injury is materially increased in cases where the horse's head is not well set on, or if the neck is thick, or the paws narrow. These physical conformations are peculiarly effected by the tight reining practice.

The shape of the larynx or windpipe will occasionally be altered, if they be thus squeezed between the jaws and bones of the neck; or if the muscles which expand the opening into the windpipe for the purpose of natural breathing be compressed, they will be incapable of full action, and by degrees will lose the power of action, even when not pressed upon. There-

Dept. 173 EST 1872 ST. LOUIS, MO.

for, the opening not being sufficiently enlarged during rapid breathing of the animal, the air will rush violently through the diminished aperture, and the sound termed roaring will be produced.

A sound somewhat similar to roaring may also arise from a tumor in the nose. In this case it may be possible to remove it. Or it may arise from a thickened state of the membrane of the bronchial tubes as sometimes found after catarrh, laryngitis. The usual treatment for this is blistering. Large horses with long windpipes are more predisposed to roaring than smaller ones; ponies are seldom, if ever, affected.

Treatment for Roaring

The treatment for roaring is very unsatisfactory. If it is occasioned by mechanical injury as in reining, the remedy is obvious, and this mischief is usually done to young horses and the unthinking horseman is the only cause.

Every kind of treatment—from firing down the outside of the throat to the excision of the muscle has been done with only partial success. In the early stage of the disease, whether it proceeds from violent pressure, or in consequence of catarrh or strangles, or the enlargement of some neighboring part, inflammation will be present; then one can be justified in having recourse to blistering. The blisters may at first be confined to the upper part of the throat, but if unsuccessful there, they should extend over the whole length of the wind pipe. If the disease arises from paralysis of the muscle controlling the left vocal cord, it can be cured only by an operation removing this cord.

Horse breeders however, should not forget, that the roarer, whether horse or mare, will often entail this disease on its progeny. The subject of entailment of disease by the parent on the offspring, if given more consideration would eliminate many of the diseases that now affect all live stock on the farm. Therefore any animal that has the hereditary taint towards roaring in its blood should not be chosen for breeding purposes, and all freedom of the harness about the throat and neck should be given to young animals that are put to work before they have reached the years of maturity.

In buying ahorse it is not easy to detect the roarer. Some horses do not even show the symptoms when in moderate exercise. It may however, be easily detected by striking the horse suddenly, or even threatening him with a stick when he will utter a singular grunt or groan. A roarer is considered an unsound animal, for he is incapable of the exertion which may not only be occasionally, but ordinarily required of him.

HORSE WOUNDED BY BARBED WIRE

I have a horse that has got a nasty cut with barbed wire along his breast. What can I apply in order to get it healed?

Answer.—The barb wire cut will necessitate your careful attention, as wire wounds many times prove serious. If you have not discovered the wound until inflammation has set in, the following remedy will be found useful: One half ounce of sulphate of zinc, one half ounce of acetate of lead, two ounces of tincture of arnica in one quart of water. The wound may be bathed with the above three or four times a day until healed.

If a farmer can fence his place without the use of barb wire, he should do it. Using a high fence with the use of a single barb wire will lessen the danger. One can never tell when one of his horses may meet with an accident of this kind, but one feels safer if the fences are in good state of repair.

DRAFT HORSES NEEDED OVERSEAS

The scarcity of draft horses both for city trade and farm work exists not only in Great Britain but on the continent. Belgium is in need of large numbers of moderately priced horses for the use of repatriated peasants. In the Agricultural Gazette for October apepars a statement by Mr. H. S. Arkell, Live Stock Commissioner, who recently visited Europe and found on inquiring into the horse trade that France is in the market for farm horses of the Percheron type. In that country work horses are scarce and worth six thousand francs each. Greece, according to the Live Stock Commissioner, is now making inquiries regarding light horses and dairy catttle.

ABSORBINE STOPS LAMENESS

from a Bone Spavin, Ring Bone, Splint, Curb, Side Bone, or similar troubles and gets horse going sound. It acts mildly but quickly and good results are lasting. **Does not blister or remove the hair** and horse can be worked. NAVEL ILL

Some farms are "inoculated" apparently with germ life to such an extent that it is nearly impossible to raise young colts, and sometimes trouble is experienced with the young of other species, such as calves and pigs. I believe that the colt suffers most from his navel trouble, but have seen it in other animals, too. Most men are familiar enough with it so that it needs but little description, but some may not know as much as they would like to.

It should be remembered, then, that this disease may occur at widely varying periods of life, during the very first days after birth or in some cases may only show a swollen joint or a swelling of the navel or attachment of the cord of the belly. Squeezing it may discharge a little pus. So mild a case may show nothing more for several days, but if it becomes worse there will be noticed a tendency for the foal to act lazy and dull, refusing the teat and lying down a great deal. If the temperature is taken now it will be found to be on the rise and in bad cases the fever will be intense.

Hock Joint Swells

Probably most cases show a swelling of the hock joint ,but other points can be found and are involved. If closely examined swelling, heat and pain are also found in the affected joint. Sometimes the tension is so great that the skin breaks and the "joint water" pours out, and it is seen to carry pus with it. Such cases are usually hopeless, and indeed, many of the cases of navel ill, or oit ill, as it is often called, are fatal when far advanced when treatment is started, although in the hands of a good veterinarian who can scrape out the infected cavities and institute vigorous aseptic wound treatment some are saved.

The high mortality in foals that are affected with this trouble however teaches that prevention is wonderfully worth while in fighting the disease on a farm, and fortunately, is usually quite successful when intelligently applied and no part of the program is neglected.

The general rules to observe in fighting this disease are those of sanitation or extra cleanliness. If we are trying to raise young animals in a place with a bad record for infectious disease or which has harbored many animals with wounds and discharging sores, let us assume that the seeds of disease are probably in greater or lesser abundance in all the barn litter and feed yard soil.

If the weather will permit and a good, clean pasture is available, no safer place will be found for the pregnant female to drop her young than in the open, for infection will be less out there than close up about buildings because the sun has in a large measure killed the germ life. If the weather will not prmit of using the pasture, we have to clean the box stalls and goor the very best that brooms and hoes will do it, and get all the sunlight into it that we can. Spray it with a 5 per cent. solution of good coal tar dip in water, and bed it heavily with straw that has not been run over by other animals—be sure it is not soiled with stable infection.

Keep the hind parts of the dam washed clean with a mild antiseptic solution until birth occurs and watch closely for this event, receiving the young animal on the cleanest surface it is possible to provide, and at once disinfect the cord with an antiseptic such as a 10 per cent. solution of tincture of iodine in water, or 2 per cent. liquor cresol compound. Keep the cord covered for several days with a good powder made of equal parts boric acid and powdered charcoal, or a good carbonized dusting powder that your veterinarian or druggist can supply as a rule from the shelf.

For Heaves, Coughs, Worms, give to your horses the best possible remedy

NOVA SCOTIA'S FIRST ANNUAL EGG LAYING CONTEST

Nova Scotia's First Annual egg laying contest is now in full swing. The pens were closed to visitors two weeks ago, and records began on Nov. 1st. There are thirty pens in the contest, nearly all of them pullets. The contest will run until Sept. 30th, 1920. Each pen contains five birds, and no male birds appear in this contest.

The houses have been erected at the East of the plot occupied by the Poultry Department, on freshly seeded ground. The equipment has been inspected by Dominion experts and pronounced the very best possible. Each pen contains four trap nests, a dry feed hopper, grit and shell box, a hopper for hard grain, a small wooden feed trough and a record file.

A systematic record will be kept and published week by week of the number and weight of eggs produced by each hen in each pen. Records will also be kept of the quantities of feed used, so that full data may be at hand at the close of the contest to make an accurate estimate of the cost of producing the eggs.

The main object of the whole program is to stimulate the egg production of Nova Scotia. According to the latest census figures the average hen in Nova Scotia now produces about 80 eggs per year. At present prices for feed this would not much more than maintain the hen. An increase of 10 to 15 eggs per year from each hen would mean an immense economic gain to our farmers. It is believed that this and other similar contests will fully demonstrate the possibility of making even larger gains through selection of the best birds, selection of the most productive strains, proper housing, cleanliness, fresh air and pure water.

Interest in this first contest is running high already, and will doubtless grow keener as the records come out from month to month. The following is the list of breeders who have entered pens in Nova Scotia's First Annual Egg Laying Contest.

Pen No. 1.—E. C. Griffin, Port Williams, N. S., R. I. White, Pullets.

Pen No. 2—John R. McDonald, Box 344, Glace Bay, S. C. White Leghorn Pullets.

Pen No. 3—John R. McMullen, Truro, N. S., Barred Plymouth Rock Pullets.

Pen No. 4—Wm. A. Reynolds, 3 Edinburgh St., Halifax, White Wyandotte Pullets.

Pen No. 5—J. W. Williams, Wolfville, N. S., White Wyandotte Pullets.

Pen No. 6—Robert H. Reid, New Glasgow, White Wyandotte Pullets.

Pen No. 7—Dr. H. W. Cain, Falmouth Sta., N. S., Rhode Island Red Pullets.

Pen No. 8—Wm. Beasly, 17 Seaforth St., Halifax, Buff Wyandotte Pullets.

Pen No. 9—J. Everett Spencer, Mira Gut, C. B., S. C. Whit eLeghorn Pullets.

Pen. No. 10—Evangeline Poultry Yards, Wolfville, N. S., White Wyandotte Pullets.

Pen No. 11—W. W. Osborne, New Glasgow, S. C. Buff Leghorn Pullets.

Pen No. 12—E. C. Griffin, Port Williams, R. I. Red Pullets.

Pen No. 13—F. E. Jackson, North Sydney, Barred Plymouth Rock Pullets.

Pen No. 14—James McIntyre, Dominion No. 4, C. B., S. C. Leghorn Pullets.

Pen No. 15—W. J. McKinnon, Truro, N S., Ancona Pullets.

Pen No. 16—Duncan C. Fraser, Antigonish, Barred Plymouth Rock Pullets.

Pen No. 17—C. F. Gallant, Caledonia Mines, C. B., White Wyandotte Pullets.

Pen No. 18—Nat. Doherty, Franklin St., Halifax, Barred Plymouth Rock Pullets.

Pen No. 19—Miss Helen King, Box 765, Halifax, Buff Orpington Pullets.

Pen No. 20—Mrs. Jos. Milligan, King's Head, Pictou Co., White Wyandotte Pullets.

Pen No. 21—Messrs. Perry & Son, Billtown, N. S., S. C. Brown Leghorn Pullets.

Pen No. 22—Edison E. Eagles, Box 34, Windsor, White Leghorn Hens.

S. C. Ancona Pullets.

Pen No. 23—H. H. Hull, Glace Bay,

Pen No. 24—A. A. Sutherland, Westville, N. S., Rhode Island Red Pullets.

Pen No. 25—C. B. McMullen, Truro,

Bottle Cleaner—Baby Healthier

Read what the maker of a famous baby-food has to say:

"Simply rinsing feeding bottles in water will not do. As soon as the meal is finished, the bottle should be rinsed with hot water and Gold Dust, *otherwise the fatty constituents of the milk cannot be removed from the inside of the bottle.*"

But—be sure it *is* Gold Dust you buy. The name FAIRBANK'S and The Twins are on every package.

Pen No. 29—Robert H. Evans, Box 192, Trenton, S. C. White Leghorn Pullets.

Pen No. 30—W. A. Warren, Bridgetown, N. S., Barred Plymouth Rock Pullets.

Summarizing the list it will be noticed that there are six pens of White Wyandottes, six pens Rhode Island Reds, five pens White Leghorns, five Barred Plymouth Rocks, two pens Anconas, one each of Rhode Island Whites, Buff Orpingtons, Buff Leghorns, Buff Wyandottes, Single Comb Brown Leghorns and Rose Comb Brown Leghorns. There is thus a fine variety of breeds and strains. Reports will be sent out from time to time giving full details of the progress of the contest. The manager of the Poultry Department at the Agricultural College will be prepared to give information relative to any of the pens in the contest at any time.

SPRAY CHECKS MITES IN POULTRY HOUSE

Frequent cleaning and a liberal use of a good insecticide will aid materially in preventing an outbreak of mites in the poultry house. For spraying over the walls, floors, perches, nests and dropping boards, the Ohio Experiment Station recommends the following solutions:

(1) Three parts of kerosene mixed with one part of either crude carbolic acid or commercial cresol.

(2) Kerosene emulsion made by dissolving half a pound of hard soap in a gallon of water by gentle boiling and then adding two gallons of kerosene; one part of this emulsion is mixed with six parts of water.

(3) Lime-sulphur solution as recommended for dormant spraying of fruit trees.

(4) Cresol disinfecting solution made as follows: Put 3 1-5 quarts of raw linseed oil in a 5-gallon crock. Dissolve 1 pound 6 ounces of commercial lye in another container starting with half a pint of water and adding more very slowly if it is needed to dissolve the lye. After 3 hours very slowly add the lye solution to the raw linseed oil, stirring constantly until a smooth liquid soap is produced. Then very slowly stir in 8 1-2 quarts of commercial cresol. For most work a 5 per cent. solution with water is used, or about 12 tablespoonfuls to a gallon of water.

After the litter and nest material are removed from the house, the inside should be sprayed thoroughly with one of these solutions. A spray pump is effective to force the material into crevices. Since the mites are especially numerous on perches and nesting boxes, these should also be well sprayed with the insecticide. Care should be taken not to get any spray on the eggs as it gives them an undesirable flavor. A second application about a week later is necessary to kill mites that escaped the first treatment or hatched out afterward.

These small, blood-sucking mites are perhaps the most injurious pests of fowls. They feed on the birds at night and congregate in swarms under roosts or in nest boxes in the day time. They may so overrun a poultry plant as to make it almost uninhabitable if measures are not taken to prevent their spread.

MAKE HENS LAY IN THE HEN HOUSE

How many farmers have ever stopped to think how much time they lose and inconvenience they suffer, to say nothing of the loss in number and quality of eggs, by allowing hens to lay all around farm buildings? It is always easier to ask a question than to answer one, and many people believe that it is next to impossible to prevent hens from laying out of doors during the summer months. While that is true to a large extent it is not impossible, and there are many farmers and poultry keepers who have little if any trouble in that regard. There are some farms where the poultry are allowed free range, and yet they always lay in the places provided for them. Why so? There must be reasons, and a few of them are not hard to find.

In the first place it is natural for the hen to seek a cool place to lay, and that certainly is not possible in the average henhouse, consequently if they are expected to lay there some provision must be made to cool the building. That may be done by removing the windows, opening the trap doors, and leaving the door open when possible. Then the place must be cleaned out, and that should be done before the hot weather sets in. Fresh, clean straw scattered on the floor will make the place more comfortable and healthy, and the nests sohuld be cleaned out and filled with clean straw at frequent intervals. Another method that is used by some poultrymen, and apparently gives good results is to spray the inside of the henhouse with cold water on very hot days. It not only settles the dust but cleans off the walls and ceiling, thereby lowering the temperature several degrees. Of course that can only be done where there is an elevated water tank, but they are a common thing on the farms of Central Canada. Still another aid in keeping the hens from laying all over the place is to have no hiding places for them around the buildings. If the board or rail fences are replaced with wire ones, the rubbish piles removed, the large weeds kept cut (especially burdocks), and the many odd similar hiding places removed or closed up, the hens will lays their eggs in the nests provided.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

My business is not to make myself,
But to make the absolute best of what God made.

—Robert Browning.

TRUSTEES

As he climbed into the buggy John Wells shook his head and scowled. Jacob Ritter, who was holding the reins, had climbed in only a few moments before. He had scowled also.

On one side of the road was a sixty-acre corn field, dotted here and there with one-year-old stumps, which would be removed before the next rotation should be sowed. Opposite was a two-acre field, in the midst of which was a square, box-like building of unplaned boards not six weeks from the trees. Fresh stumps were around the building, as they were in the two immense corn fields on either side.

The building was the school house, half a mile from the nearest dwelling. In the school house were thirty pupils gathered from five miles around, and a teacher imported from the east.

"Parson's work," grumbled Jacob Ritter, as he brought down his whip with unnecessary vigor across the horse's back.

"None o' his relation, either, for an excuse," added John Wells morosely. "We might 'a' put up with a poor cousin o' something for the sake o' the parson. But this one's brung here here for her su-perior attain-ments," drawling out the words bittrely. "Superior fiddlesticks! She's about as big as your whip handle Jacob, an' willowy 'nough for a ten-year-old to get around with ex-cuses."

A half mile of the new road was jogged over in silence. "No. 5 school over in Ridge county's got a woman o' forty with a hand like a man's," said Jacob. "An' I did hear she spelled the whole dictionary through when a girl. Ain't no unruly boy goin' to get around her."

"My cousin Jim's boys go to a school jest over the line t'other way," observed Wells, "an' they say they never tried to browbeat their teacher but once. That was thir lesson. An' they're ten an' seventeen years old, an' their teacher's a woman. But she weighs a hundred an' eighty, Jim says."

"I, wouldn't be surprised if Miss Susan Hope—our hope," sarcastically, "weighs nigh on to eighty."

Ritter's face broke into something like a grin, and he looked at his companion with a side glance. "Reckon mebbe it's some wounded pride on our part," he remarked. "I b'lieve I did brag a little to that man teacher from the Ridge. Goin' to have a teacher that would take our school right to the top, even if 'twas new. Seemed good to think our fust school might be the banner one o' the whole country roudn. Huh! It's all along o' what the parson said 'bout bein' a top notch. I did hunt for the Ridge man to come over to see my crops with an idee of invitin' him into our school. But I reckon I shall be too busy."

"Too late for Jim," confessed Wells lugubriously. "I was over with him two days an' visited the school. Saw the teacher yank a whisperin' boy out o' his desk quicker'n lightning an' rush him up to the platform with his feet scursely touchin' the oor. My, but wa'h't the other boys scared! Jim felt proud, an' said he was comin' over to see ours."

"Oh, well, half this day wasted," mumbled Wells, as he slid from the buggy in front of his house. "But 'twas in the way o' duty, as trustees a visiting their school, even if we did sit for two hours listenin' to things that wan't neither readin' nor arithmetic, though I will say in justice that she, our Susan, kept the children interested."

"So could you and me, playing peek-a-boo with 'em," snapped Ritter.

"Maps an' globes have their places," observed Ritter. "I ain't speakin' ag'in 'em as desirable things, an' hope we may have a few when we get a teacher with enough discipline to use 'em right. You noticed the dictionary on the table, which Miss Hope brought herself, an' how one o' the boys walked right up to it without raistin' a hand an' without waitin' for permission. She told me something 'bout honor among scholars, but 'tain't discipline. They need clubs. But good-bye," tightening his reins. "Time I was to work."

The corn in the fields ripened and here and there over the country appeared parallelograms of rich, moist earth, plowed for the fall wheat. Then one day Ritter's buggy again stopped in front of Wells' house.

"Howdy," said Ritter. Then, as Wells climbed in. "Queer goin's on in the school."

"Queerest in all the world," assented Wells. "If she'd whaled the last one o' them big boys an' then throwed teh whole lot through a winder, I couldn't 'a' been half so suprised. Fact is," looking at Ritter apologetically, "I 've been wantin' to go over for the last three weeks to see how she done it, an' would have been willin' to drop the corn cuttin' an' plowin'."

"But ye felt a little shy 'bout actin' friendly after all we said an' hinted an' looked that day we visited," grinned Ritter. "Anyhow, that's the way I felt. An' I thought 'twould be jest as well to wait a little longer an' see for certain how things were goin'. In spite of all we've heard an' seen, it don't seem possible that cnip could be behind movin' them."

Wells nodded. "Strangest thing to my mind is the Riggles boy," he said. "Twenty years old an' never did a lick o' honest study in his life, an' only went to school to pester teachers. An' now he an' Miss Hope can be seen most any time walkin' along the road with their heads bent down. Seems he's a nat'ral stone hunter — mineralogist I b'lieve they call 'em—an' nobody ever suspected it, not even he as its bein— something useful. Now they say he's tudying them kind of books day an' night, with her helpin', an' that she declares that the whole country's going to be proud o' him some day. Soon's he gets a little more knowledge she intends to write to a friend an' have him started in a special school o' that kind."

"Yes, Sam Riggles is—I mean was —the hardest case we had," agreed Ritter. "Even farmers got so they wouldn't hire him on 'count his pesterin' ways. But he wa'n't much worse than Bill Tysen an' Patsy Wade. They were all in the same gang. An' now my boy says Bill is goin' to be a lawyer—he always did have arguryin', hectorin' ways—an' Patsy settin' out to beat the other scholars on the very studies he knew the least of, an' what the'd been laughin' at him about. I don't understand how she ever got round 'em, except that she treated the boys jest like she would one o' the board or the superintendent himself, an' they got to holdin' their heads pretty high up in consequence. Gener'ly folks have made 'em feel 'bout what they thought of 'em."

"Noticed any difference in your own boys?" asked Mr. Wells. "My Nick's a nat'ral farmer an' hates books. But our Susan got to talkin' with him 'bout soils an' what this crop needs an' what that crop needs, an' what rain an' sunshine does for land, till she's actually got him to lookin' into books to see if such things are really in print. I declare, it beats me to see Nick sittin' up evenin's porin' into books that he'd kicked across the floor a month or two ago. Of crouse, her knowledge is all book learned, but it's amazin' how near she hits to the truth. Nick's told me some o' the things she's said 'bout soils an' crops, an' I declare they sound jest like an old farmer."

"My boy Tom's plan is to be a merchant," sighed Ritter, "an' he don't seem to take much interest in crops. He's always been good at figures, but skittish 'bout other studies an' ready for any sort of skylarkin'. Now she's got him into bookkeepin' and algebra an' other things that bear on merchandisin', an' he's settin' down to real hard work. An' I do hear Miss Hope has found at nat'ral bent in quite a number of the bigger boys an' is gettin' them all into workin' harness."

They jogged up a long slope in silence. On one side was a man drilling in wheat; on the other a gang plow with points slanting into rich soil at the ends of the newly turned furrows. They nooded to the man on the drill, who nodded back.

"Jask Wilson was down to the school, I heerd," remarked Wells, with a grin. "Jest carried away with the teacher, an' says if he was the whole board without no rules he'd put her in for life."

"Wouldn't wonder if Steve Hall's visitin' today," said Ritter, glancing towards an idle gang plow. "His girl Anna's takin' music lessons from Miss Hope, I hear. She's boardin' to their house now. Yes," as the yreached the summit of the slope, with a view of the school house on th level below, "there's his bugyy under that tree."

"Wondr is we'll be carried away like the rest of 'em," speculated Wells. "With all this talk an' our children dooin' so well I sort o' feel like apologizin' for the way we acted on our other visit."

"We mustn't let ourselves be drawn in too fast," warned Ritter. "Of course, we're bound to let her have some o' the fixin's she's askin' for; but some had better be carried over to another year. It's always best to go slow."

That's so," agreed Wells. "But here we are."

As they entered the school room Miss Hope came forward and gave them her hand, conducting them to chairs beside Steeve and near the table. They seated themselves with the awkward consciousness that the chairs were of the teacher's own providing, possibly borrowed from the place she boarded at.

It was nearly two hours later when they returned to their buggy and they did not speak until they had passed over the slope and were in front of Wells' home. Then as Wells dropped to the ground, Ritter looked down at him with a questioning smile.

"Gave here everything she asked for," he said peprecatingly.

"Yes, everthying," Wells assented. "But I'd about made up my mind to that before we went in."

DRESSING UP YOUR CHRISTMAS GIFTS

Did you ever look forward to receiving Christmas parcels every year from certain people, just because they were put up in dainty wrappings and tied with bright colored ribbons? These people seem to have the wonderful talent of making a gift perfect. Perhaps their rememberances, from a monetary sense, are tiny, but they al-

ways typify daintiness and appropriateness.

Sister Mary's Christmas Packages

Sister Mary is one of these. She sends the most charming of Christmas packages, and they are never in succeeding years the same. To begin with, her packages usually arrive in an unmolested condition because she makes it a point to send them before the Christmas rush. They are therefore handled in less confusion and without the heavy traffic that is unavoidable later on; and the message "Please do not open until Christmas" pasted upon the wrapping bears its own command.

Months before she has held the Christmas thought in mind and has saved all the immaculate wrapping-paper that has come into the house. Boxes of desirable sizes have been hoarded for the same purpose, even from the preceding Yule-tide. Magazines are searched throughout the year for appropriate pictures to embellish these boxes and to give them the holiday spirit "from the very first peep," as she expresses it.

With an unstinted supply of snowy tissue-paper she paces each gift in a sizable box; and last year she wrapped each box in a mossy shade of green tissue-paper. She next tied it securely with white satin baby ribbon and pasted oved the entire upper surface of the box a picture of a Christmas or winter scene, or one approriate to the recipient.

Each Year She Makes Them Different

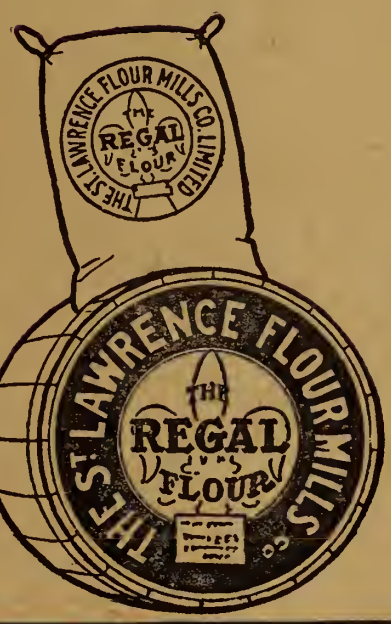
When several packages were going to one family, as they were to her brother's children and to ours, she packed them into one large box, sprinkled artificial snow-dust over the mossy green mass within and wrapped the large box in green tissue, tying it with a wider width of white ribbon. About this was put strong Manilla paper tied with stout cord so that the dainty contents were intact when received. Red, of course, is the universally used color, and one friend has the knack of using it to the best advantage.

She ties boxes wrapped in glazed white paper with bows of cherry-colored ribbon, and moire-papered packages with holly ribbons. Red ribbons on red glazed paper are relieved by gilt lettering on the package, while sometimes a verse of holiday cheeriness or a Christmas motto is inscribed on her all-red package in white ink.

Sometimes the quantities of ribbons required by the giver of many presents make too deep an inroad into her Christmas pocket money, but there are means of making packages attractive other than tying them with ribbon. Gold and silver cord serve the purpose equally well and are much less expensive. One girl saves the tissue ribbons that bind handkerchiefs and other merchandise, and while these are too soft in texture to make ornamental bows, she has a deft way of adorning a package by putting the ribbon around in bands and fastening the ends with a monagram of sealing wax of a harmonizing color.

One particularly dainty package which I received from her was wrapped in sheet cotton that had been treated to "snow storm" of glistening particles of isinglass, while bands of yellow tissue ribbon were caught on the top of the snowy pile by a great,

The Big Value in
FLOUR



IN THE HOMES of the people, far and near, "REGAL FLOUR" is known for its high and uniform quality; it is known as the most important factor in bread baking success.

Head Ached So Bad

HAD TO GO TO BED.

When the liver becomes sluggish and inactive it does not manufacture enough bile to thoroughly act on the bowels and carry off the waste matter from the system, hence the bowels become clogged up, the bile gets into the blood, constipation sets in and is followed by sick and bilious headaches, water brash, heartburn, floating specks before the eyes, and painful internal, bleeding or protruding piles.

Milburn's Laxa-Liver Pills regulate the flow of bile so that it acts properly on the bowels, and stirs the sluggish liver into activity.

Mrs. E. Bainbridge, Amherst, N.B., writes:—"I take pleasure in writing you of the good I received by using Milburn's Laxa-Liver Pills for headache. I was so bad I had to go to bed, and could not sit up. A friend told me about your wonderful medicine, and two vials have made me as well as I can be."

Milburn's Laxa-Liver Pills are 25c. a vial at all dealers, or mailed direct on receipt of price, by The T. Milburn Co., Limited, Toronto, Ont.

splashing bronze monograd.

Red and Green Cord for Tying

Even red and green cord is suitable for binding the Christmas box, and only lack of tidiness could detract from its use. Boxes wrapped in soft tones of yellow or brown fastened together with bands of harmonizing shades of passe-partout are all that lan be desired for novelty and attrartiveness.

The bestower of gifts who lives in the country need not despair for beautiful wrappings, but she must prepare her commodities before the season. Let her save the long reed-grasses for tying purposes, while birch bark is undeniably lovely not only for making gifts but also ror covering them. Careful clusters of pine-needles when tied to a box with reed-grasses will become a refreshing sight for city eyes. The leaves of al most every tree are glorious for orna menting packages if they have been carefully pressed and gilded, while the bright autumnal tints should be preserved in their natural colorings. Baby pine cones can be picked while still tiny, and gilded, or else dashes of white carefully touched upon the innumerable edgings give the effect of snow and are picturesque additions to the top wrapping of any parcel.

Add a Touch of Holly

In the parts of the country where the holly and mistletoe grow it should be known that sprigs of these typically Yule-tide buds and their glistening leaves attached to gift offerings are invariably welcomed most gleefully by those less fortunately situated. In small places it is often difficult to secure suitable boxes for transporting gifts, but clever fingers can be made to fashion even prettier home-made receptacles. Designs are first sketched on a nice piece of pasteboard, and thn cut out with a sharp knife, holding the pasteboard flat on a board, or better still, it should be tacked in place.

Doily cases, rolls for centrepieces, glove and handkerchief boxes can be made in this way. And the add to the gifts by expressing to the recipients that you have given them your thought throughout. — Copied from December, 1912, Number of the Woman's Companion.

MORE THAN MONEY

What one busy woman found she could do to help a delicate child in need of a good home and nourishing food may point to a wide field of endeavor for the woman on the farm or in the suburbs. Busiest of the busy, with her own house filled to the eaves with children and not a penny to spare when she read of the needs of a little child of four, she supplied the need by taking fresh eggs and milk to him from the farm when she went to town twice weekly to sell eggs and dairy produce. Everyone has something to share—rosy apples for the newsboy, a few fresh eggs for an invalid, a basket of fresh vegetables for the woman with many children—things which, in the plenty of the country seem too little to give, are luxuries to city eyes and bring health and pleasure.

AN ENEMY OF MANKIND

A Subtle Foe to Deal With

The subtle, unsuspected enemy, which, taking hold on the kidneys, saps them of their strength and vitality, rendering them inactive and unable to remove the poisons and waste substances from the blood, should immediately be dealt with. All who suffer from backache, pains in the sides, sciatica, rheumatism, neuralgia, constant headaches, constipation, that helpless feeling of lassitude; stiff, swollen joints, hands and ankles, sore muscles, sleeplessness, floating specks before the eyes, irritability, should at once begin treating the kidneys with Gin Pills, which are by far the most effective remedy for diseases of this vital organ.

The first sign of pain in the back or side is warning enough. Do not delay. Once the kidneys and bladder get out of order, most serious, and often fatal consequences are likely to follow in quick sequence. Get a box of Gin Pills today, and correct the derangement before it is too late. At all druggists or dealers, 50c. Money refunded if not satisfied. Free sample on request.

THRIFT RECIPES FOR NOVEMBER

(From the Modern Priscilla)

Economy Lunch Cakes

1 can salmon.
1 onion.
½ pint cracker or bread crumbs.
3 large boiled potatoes or 4 small ones.
1 egg.
Salt to taste.

Empty the contents of the can of salmon in a mixing-bowl, remove bone and skin, add boiled potatoes, onion chopped fine, crumbs, egg, and salt. Mix well. Make into cakes one-half inch thick and fry until brown.

Sausage Roll

4 cups flour.
1 cup ice-cold water.
Salt.
4 tablespoons lard.
4 pounds sausage.

Rub the lard into the flour with the tips of the fingers, add salt, mix with cold water, stirring with a knife. Cut in small quantities, and roll the pieces thin. Place a moderate-sized sausage in each piece; roll the dough over, wetting the edges where rolled in. If preferred the sausages may be pricked and baked for ten minutes before placing them in the dough.

Date Cake

1 cup chopped dates.
1 cup sugar.
1 tablespoon fat.
1¼ cups flour.
½ cup chopped walnut meats.
1 cup hot water with 1 teaspoon soda.
1 egg.
1 teaspoon vanilla.

Pour hot water and soda over dates and let stand while mixing other ingredients. Cream fat and sugar and add eggs beaten light. Then add dates and hot water. Add flour, vanilla, and walnut meats and bake in loaf forty-five minutes. One medium sized loaf.

Mrs .W. F. K., Michigan.

Good Plain Cake

2 cups sugar.
3 egg yolks.
3 cups flour.
3 egg whites.
Pinch salt.
½ cup fat.
1 cup water.
4 teaspoons baking powder.
1 teaspoon flavoring.

Cream sugar and fat together. Add beaten yolks of eggs and gradually water. After mixing thoroughly add three cups sifted flour, reserving little in which baking powder is added. Beat for about five or ten minutes before adding the remainder of flour and baking powder and lastly fold in the whites of the eggs and flavoring and salt. Three layers or two medium-sized cakes.

Mrs. R. M., District Columbia.

HALLAM FUR FASHION BOOK 1920 EDITION—FREE

Write for your free copy of Hallam's Fur Fashion Book which contains 48 pages and cover, illustrating over 300 beautiful Fur Garments, all genuine photographs of the articles just as they are and real people wearing them. It shows you a much greater variety than you can see in most stores and will save you many dollars. It is absolutely free. Address as below.

John Hallam Limited
1608 Hallam Building, TORONTO.
THE LARGEST IN OUR LINE IN CANADA

We have already given away $5.000 FREE. $200.00 more IN CASH and numbers of Merchandise Prizes will be GIVEN AWAY at an Early date.

1st Prize, **$50.00** in Cash. 2nd Prize, **$40.00** in Cash
3rd Prize, **$35.00** in Cash. 4th Prize, **$25.00** in Cash
5th to 9th Prizes—Each **$10.00** in Cash.
TOGETHER WITH MANY MERCHANDISE PRIZES

Herewith will be found the picture of a Log Hut in the Woods. At first glance all you see is a man, a woman and a dog. If you look closely the faces of 8 other persons will be found. Can you find them? It is no easy task but by patience and endurance can be accomplished.

You may win a cash prize by doing so. Many have done this as will be shown by the names and addresses which we will send you. If you find the faces mark each one with an X, cut out the picture and send it to us, together with a slip of paper on which you have written the words "I have found all the faces and marked them." Write these nine words plainly and neatly, as in case of ties, both writing and neatness are considered factors in this contest.

This may take up a little of your time but as TWO HUNDRED DOLLARS in cash and many merchandise prizes are given away, it is worth your time to take a little trouble over this matter. Remember all you have to do is to mark the faces, cut out the picture and write on a separate piece of paper the words, "I have found all the faces and marked them."

WE DO NOT ASK YOU TO SPEND ONE CENT OF YOUR MONEY IN ORDER TO ENTER THIS CONTEST

Send your answer at once; we will reply by Return Mail telling you whether your answer is correct or not, and we will send you a complete Prize List, together with the names and addresses of persons who have recently received over Five Thousand Dollars in Cash Prizes from us, and full particulars of a simple condition that must be fulfilled. (This condition does not involve the spending of any of your money.)

Although these persons are entirely unknown to us, they are our references. An enquiry from any one of them will bring the information that our contests are carried out with the utmost fairness and integrity.

Winners of cash prizes in our late competitions will not be allowed to enter this Contest.

This Competition will be judged by two well known business men of undoubted integrity, who have no connection with this Company, whose decisions must be accepted as final.

Your opportunity to win a good round sum is equally as good as that of anyone else as all previous winners of cash prizes are debarred from entering this contest.

Butterscotch Pie

1 cup brown sugar or ½ cup white and ½ cup brown.
1 cup milk.
Vanilla.
3 tablespoons flour.
8 tablespoons butter.
2 egg yolks, well beaten.

Mix flour and sugar. Add egg yolks well beaten and milk. Add butter and cook in double boiler until thick. Add flavoring. Put in baked crust and make a meringue of egg whites. Place in a very moderate oven and brown slightly. Serves six.

Mrs. G. P. F., Missouri.

Spanish Chocolate

1 quart sweet milk.
4 tablespoons grated chocolate.
1 teaspoon vanilla.
1 cup sugar.
2 tablespoons corn-starch.

Scald milk. Mix sugar, chocolate, and corn-starch with some cold milk and add this to hot milk, stirring constantly, till it boils. Boil until chocolate is entirely melted. Remove from stove, add vanilla, and beat. Cool, place in freezer and freeze. Serves six.

Mrs. E. P., District Columbia.

Salad Dressing

1 cup vinegar.
2 tablespoons flour.
Pinch of salt.
1 teaspoon fat.
½ cup sugar.
½ teaspoon mustard.
Speck black and red pepper.

Heat vinegar and sugar nearly to boiling point. Mix mustard and flour dry, then add cold water to make smooth paste, on which pour the hot vinegar and sugar, stirring all the time. Put mixture on stove, add butter and cook until thickened. Chill. Makes one and one-fourth cups dressing.

Mrs. A. E. A. D., New York.

Creole Meat Loaf

1 pound chopped beef from round.
½ cup bread crumbs .
1 teaspoon salt.
½ cup tomato pulp.
1 egg yolk.
¼ teaspoon pepper.

Bake in a covered pan or individual molds in a muffin-tin for one-half hour. Uncover and bake twenty minutes longer to brown. Serve with a tomato sauce if desired. Serves ten.

Mrs. H. P. F., Massachusetts.

Yes, Ma'am!
Real homemade Pie!

With top and under crust that truly melt in your mouth—and a generous filling of your own delicious homemade preserves or home-grown fruit.

That's a pie worth eating, and worthy of your baking, and it's the kind of pie you can make every time with

BEAVER FLOUR

MILLED OF BLENDED WHEAT

"Beaver" Flour equals any of the "special pastry flours" because it is, in itself, a special pastry flour—being the choicest Ontario fall wheat, blended with western spring wheat to give it strength.

This is why Pies, Cakes, Cookies, Tarts, Doughnuts, Buns and Fancy Pastry —when made with "Beaver" Flour—are so light, so flaky, so uniformly good.

This is also why the Bread and Rolls—made with "Beaver" Flour—have a delicate, nutlike flavour that is totally lacking in western spring wheat flours.

Just try "Beaver" Flour for anything you are baking—and see what happy results you get, every time.

Coffee Tapioca

4 tablespoons minute tapioca.
½ teaspoon salt.
¼ cup nut meats cut in small pieces
4 tablespoons marshmallow cream.
1½ cups boiling coffee.
6 tablespoons sugar.
2 tablespoons lemon juice.

Bring coffee to coiling point . Add to tapioca and cook until clear and thick. Add salt and sugar and lastly the nuts, cream and lemon juice. Serve cold with or without cream. Serves five.

R. S. E.

Banana Fritters

1 cup flour.
¼ teaspoon salt.
¼ cup milk.
1 egg.
1 tablespoon lemon juice.
2 teaspoons baking powder.
1 tablespoon sugar.
1 tablespoon melted fat.
2 bananas.

Mix and sift dry ingredients. Separate the egg and beat both yolk and white until light. Add milk to first mixture, then the egg yolk. Add the bananas which have been put hrough a ricer and lemon juice. Fold in stiffly baten white . Drop by tablespoons into deep fat and brown. Sprinkle with powdered sugar and serve with lemon sauce. Serves five.

S. B.

Corn Fritters

1 can corn (2 cups.)
1 teaspoon baking powder.
1 cup flour.
¼ teaspoon paprika.
2 teaspoons salt.
2 eggs.

Mix and sift dry ingredients. Add to corn; then add yolk of eggs, beaten until light, and fold in stiffly beaten whites. Drop by spoonfuls onto a hot, well-greased griddle, and cook as you would griddle cakes. Serves five.

Cream cheese.
Lettuce.
Mayonnaise dressing.

Select deeply indented green peppers, and, after washing them and removing seeds, stuff with cream cheese solidly mixed with chopped nuts. Place on ice until cold and then slice them desired thickness. Each slice will resemble a shamrock. Arrange on a nest of lettuce leaves and garnish with mayonnaise dressing. One pepper makes two salads.

Mrs. J. B. D., West Virginia.

Scalloped Carrots and Potatoes

6 medium sized potatoes.
5 medium sized carrots.
Milk.
Salt.
Pepper.
Fat.
Bread crumbs.

Prepare potatoes and carrots for scalloping, slicing them in one-eighth-inch slices. Put a layer of potatoes in buttered baking dish, sprinkle with salt and pepper; then a layer of carrots with salt and pepper and dot over butter; repeat with potatoes etc., Add hot milk until it may be seen through top layer. Have a layer of buttered crumbs on top. Cook about one and one-fourth hours or until the vegetables are soft. Serves four.

Mrs. M. T. V. D., New York.

It is more difficult to succeed as a master breeder of livestock than it is to become a master artist in the painting of pictures and the carving of statues.

Kidneys Were Bad After The "Flu"

Sat Up to Turn In Bed.

That awful epidemic, the Spanish influenza, that swept Canada from one end to the other a short time ago, left in its wake a great many bad after effects. In some cases it was a weakened heart, in others shattered nerves, but in a great many cases weak kidneys have been left as a legacy.

Where the kidneys have been left weak as an after effect of the "Flu," Doan's Kidney Pills will prove to be just the remedy you require to strengthen them.

Mrs. Harvey D. Wile, Lake Pleasant, N.S., writes:—"Last winter I was taken sick with the "Flu," and when I did get better I found that my kidneys were very bad, and at night I had to sit up to turn around in bed. I used Doan's Kidney Pills, and found that they did me a wonderful amount of good. I also recommend them to my husband, and he started in to use them. I will always recommend them to anyone who is bothered with kidney trouble, for they are wonders."

Doan's Kidney Pills are 50c. a box at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

See that our trade mark, a "Maple Leaf," appears on the box.

HOW CHRISTMAS CUSTOMS CAME ABOUT

Why Do We Keep Christmas?

Christmas celebrates the birth of Jesus Christ. The religious event is observed by the Protestant, Catholic and Greek churches on diversified dates in different parts of the world. The festivities of the day may be traced to the ancient rites celebrated in Scandinavia, Rome, Greece and Egypt, where the pagan people feared, as the days shortened in the darkest month of the year, that the sun was dying, and observed a time of rejoicing when the sun began to stay with them a little longer each day.

The leaders of the early Chirstians church endeavored to adapt the harmless features of the heathen sun festivals as a conciliation to those who had broken with their old beliefs and vowed their allegiance to the new faith. But, despite their effort to control, Christmas resulted in orgies not to be countenanced by the Christian church. Revelry continued in England until some years after the coming of the Puritans to America the Roundhead Parliament abolished Christmas for twelve years, and in America the Court of Massachussetts followed suit. But Christmas must be kept, and it was later re-established in more sane fashion by the law in both countries, because the people were unwilling not to keep the festival.

Why We Celebrate on December 25th

Nobody knows whther that is the exact date on which Christ was born, or what people first celebrated the festival on that date. After the triumph of Chrisitianity the prejudice of the early Christians against the celebration of birthdays as heathenish died out. Some time between 337 and 352 Pope Julius directed Saint Cyril to ascertain the correct date. He reported that the Western Churches observed it on December 25th, although other churches kept the day in January, April, May, March and September. Pope Julius, so satisfied with Saint Cyril's report, set December the 25th as Christmas Day, and our observance of that date has come down to us from that decision.

Santa Claus and Christmas Stockings

Saint Nicholas seems to have been the original of our Santa Claus. He was the Bishop of Myra about the year 300, and was very popular because of his good deeds and kindness, especially to the children, whose patron saint he is supposed to be. An old legend says that he wished to bestow a gift surreptitiously upon an old nobleman who, though poor, did not want any one to know of his poverty. When the good Bishop reached the house, he saw the gentleman asleep by the fire, so he climbed to the top of the chimney and dropped his gift therein, thinking it would fall on the hearth. But it so happened that the money fell into one of the old gentleman's stocking, which his daughter had hung up to dry, where it was found and used as a dowry for his eldest daughter. And the old story says that Saint Nicholas never failed to put a gift in the stockings which were hung for him thereafter whenever a daughter of the house was to marry. When our Saint Nicholas comes around on Christmas Eve, we look for gifts in our stockings.

The date of the Bishop's death, December 6, is observed in many countries, and the closeness of his feast to that of Christmas Day has probably confounded the two celebrations. Santa Claus seems to be the name by which the good spirit of Christmas is most generally known.

Why Mistletoe Never Decorates a Church

Druids regarded religiously the mistletoe, which they called "All Heal" and offered it on their alters. The church adopted this custom but the mistletoe was purposely omitted by reason of its figuring in pagan religious rites.

Another reason given is that in olden times its use was abandoned in church decorations because it set the young folks to reading the marriage service, and holly was subsituted to indicate the dark monotony of matrimony and the many thorns with which it was beset.

Why We Sing Christmas Carols

Singing Christmas carols is a custom so old that even the origin of the word is in doubt. The first carols were modelled on the songs written to accompany the choric dance and caroling, a combination of dancing and singing, which found its way from pagan rituals into the Chirstian Church.

In the year 589 the Council of Toledo forbade dancing in the church on certain days, and in the following year all secular dances in the church were forbidden. However, the custom did not die out until about the year 1209.

Many of the carols dating from the fifteenth century have the characteristics of folk songs and preserve curious legends Carol singing flourished during the sixteenth and seventeenth centuries, and the greatest English writers, Milton and Ben Jonson among them produced some beautiful carols. A century later Charles Wesley wrote the famous, "Hark, How the Welkin Rings," better known now as "Hark, the Herald Angels Sing."

The earliest printed collection of carols was issued in 1621. It contained the famous "Boar's Head Carol," which is still sung every year at Oxford College. The carol exists in France, where it is known as "Noel" and it is also existent in Germany and Italy, although the custom has died out in Scotland and some of the Continental countries.

Why Cattle are Supposed to Kneel

There are many superstitions regarding the special endowments of animals and birds during the Christmas season, some being presumed to be gifted with speech, others with an intuition to worship, etc.

The tradition that cattle kneel in their stalls doubtless arises from the fact that Christ was born in a manger. The Spanish are very kind to all cows, because on the Holy Night they are believed to have breathed upon the Christ Child to keep him warm.

The story is told of an Indian creeping cautiously through moonlit Canadian woods on Christmas eve, saying "Me watch to see deer kneel. Christmas night all deer kneel and look up to Great Spirit." It is thought, however, that some harm will speedily come to the one who successfully spies upon these animals.

Why Christmas Centres Around a Star

When Jesus was born in Bethlehem it was the boast of Rome that "Milarium Aureum," the Golden Milestone, from which her great military roads diverged, marked the centre of the

After Five Years of Heart Trouble

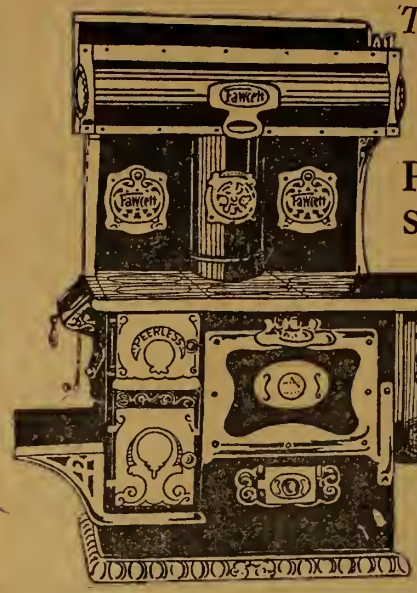
MRS. BREWER TURNED TO DODD'S KIDNEY PILLS

Now She Is Telling Her Friends Who Advised Their Use the Good Dodd's Kidney Pills Have Done.

Imrie, Alta., Nov. 20.—(Special)—Advised by her friends to use Dodd's Kidney Pills for heart trouble from which she had suffered for five years, Mrs. Mary Brewer, well-known and highly respected here, is telling how much she benefited from the treatment.

Heart trouble is nearly always caused by defective kidneys, which fail in their wark of straining the impurities out of the blood. The work of the heart is made too hard when it has to propel blood thick with impurities to all parts of the body. The result is, of course, weakness and disease.

That Mrs. Brewer's trouble came from her kidneys is shown by her symptoms. "I suffered from rheumatism, gravel, stiffness of the joints, backache and headache," she states. "My sleep was broken and unrefreshing. I was nervous and my limbs swelled. My skin itched and burned at night. It was after a doctor had failed to cure me I tried Dodd's Kidney Pills. I must admit they did me a lot of good."



The Fawcett

PEERLESS STEEL RANGE

for coal or wood

The Fawcett Range gives you better cooking, greater kitchen comfort, saves time, work, fuel, and money. "Enjoy life—use a Fawcett."

THE principal thing a woman wants to know about a range is that it is a good baker and the Peerless is one of the best on the market. It is built to give the best of service at all times. It saves fuel and gives the maximum amount of heat for all fuel used.

world. Today that stone is in fragments, while from the star that marks in the Church of the Nativity in Bethlehem the place where Jesus was born, and commemorates the star that shone in tne heavens o'er Bethlehem on the first Christmas night, radiates the influence that uplifts mankind, civilizes the world and makes all men brothers.

How the Christmas Tree Came To Be

Saint Winifred, who was, in the Eighth Century a missionary to the Scandinavians, is credited in an ancient legend with having caused to be set up the first home Christmas tree. He tried to show the people that the Druid priests had made them worshippers of trees only, and not of a living God; and on Christmas eve he hewed down the great oak tree around which they had gathered to offer a human sacrifice. As it fell a young fir tree seemed to appear miracuously beyond it, and Winifred said to the people: "Here is the living tree with no stain of blood upon it, that shall be the sign of new worship. See how it points to the sky . Call it the tree of the Christ Child. Take it up and carry it to the chieftain's hall. You shall go no more into the shadows of the forest to keep your feasts with secret rites of shame. You shall keep them at home, with laughter and songs and rites of love. The thunder oak has fallen and I think the day is coming when there shall not be a home in all Germany where the children are not gathered around the green fir tree to rejoice in the birthright of Christ.

THE AUTUMN OF OUR LIVES COMPARED WITH THE AUTUMN OF NATURE

Nature in the passing years gives to each a certain beginning, a period of growth, a time of completion, and a time of rest.

The autumn comes to us when the summer is ended, when the struggles and all energy well-nigh spent. To the completion of all that is useful and needful is added the mysterious change that gives to nature her glorious coloring pictures of such splendor and majesty that the greatest of artists cannot begin to imitate it. Life as it is given to mankind follows the life of the year in vegetation. Childhood, youth, maturity, come and pass to most of us all too rapidly, then comes the autumn of life when we feel that we must go gradually and as gracefully as we can down the winter decline.

To those of us who have had our youthful eyes on the right goal this period of life should offer the greatest pleasure. If in youth we have tried to live honestly, to fill life with right-living, to have love for our neighbors, and devotion to our Heavenly Father, we may have the feeling in the autumn of life that we have attempted to do what was worth while, and that we have accomplished the effort during the passing years. We have the satisfaction that comes to all who succeed, and we can know, to some extent, how well we have done, for we can measure the love of others for us by the love we have shown them or have for them, and we can know in our own souls, by looking within, how much or how little we are devoted to our Creator. The power of youth, the knowledge of maturity were all working towards the completion of character, and it is given to each of us to be able to ascertain a fairly accurate opinion of the results.

But the autumn of the year always brings with it some shade of sadness, perhaps for a summer of drouth or blight, perhaps for the dreary outlook of a winter unprovided for. So does also the autumn of life come to some of us with some sense of feelings far removed from real peace or pleasure. It may be that this, the thoughtful time of life, is tinged with many regrets that we did not look on life differently in our younger days, and that we did not set our eyes on the better way. It may be that with our knowledge of life, gained through all the years, we are made sad by the carelessness and wastefulness we see in others who are still young, who have not had their eyes opened to life's meanings and may some time give anything could they live over again the years now being wasted. And then, most sad of all is the autumn to those who see the winter coming without provision for it, who see the sorrows of age approaching, and are unable to look forward with faith to another springtime, where a new life awaits to lead one joyously into an existence in close relationship and blessed communion with the Father, our Creator.

WHO WILL BE MARY-PICKFORD'S LEADING MAN? $2500.00 XX PRIZES! FOR THE BEST ANSWERS.

Do You Know These Five Actors' Names?

1. Plain Rachelich 2. Learn a Lass 3. Jet Black Rig 4. Sell Raw Hip 5. In for a Bad Glass Uk

CANADA'S own and beloved Mary Pickford is about to produce one of the greatest moving picture plays of her career. It is a story abounding in love and humour, pathos and happiness.

Miss Pickford's big problem now is to select a capable actor who will be suitable as her leading man in this great production. She can pick from all the greatest moving picture actors of the world, but her selection is now down to the five favorite movie actors whose pictures are shown above. One of these five will be chosen by her to play the Leading Man's role in this great new movie production.

Do you know the Names of these five Favorite Players?

The object of this contest is to recognize and name these five most prominent movie actors. After you have recognized them, and in order to help you name them correctly, we have put their right names underneath their pictures in jumbled letters. Unscramble these letters, put them into their right order and you will have their names. In case you are not familiar with the names of the most popular moving picture actors today, the names below will help you.

Names of Some of the Favorite Players

Fred Huntley, Allan Sears, Owen Moore, Milton Sills, Jack Pickford, Charlie Chaplin, Charles Ray, Elliot Dexter, Wallace Reid, Francis Ford, Dustin Farnum, Henry Walthall, Warren Kerrigan, Jack Gilbert, Harold Goodwin, William S. Hart, Thomas Meighan, Antonio Moreno, Stuart Holmes, Francis X. Bushman, William Farnum, Robert Harron, Douglas Fairbanks, Earl Williams, Ralph Lewis, Tom Moore.

These Magnificent Prizes Given for Best Correct or Nearest Correct Replies

1st Prize,	1920 Chevrolet Touring Car, Value		$990.00
2nd Prize,	1920 Ford Touring Car, Value		$740.00
3rd Prize,	$150.00	14th Prize,	$5.00
4th Prize,	100.00	15th Prize,	5.00
5th Prize,	50.00	16th Prize,	5.00
6th Prize,	25.00	17th Prize,	5.00
7th Prize,	20.00	18th Prize,	5.00
8th Prize,	15.00	19th Prize,	3.00
9th Prize,	10.00	20th Prize,	3.00
10th Prize,	10.00	21st Prize,	3.00
11th Prize,	10.00	22nd Prize,	3.00
12th Prize,	10.00	23rd Prize,	3.00
13th Prize,	$5.00	24th Prize,	3.00

And 25 Extra Prizes of $1.00 each.

$500.00 Additional Cash Prizes will also be awarded.

First Prize VALUE $990.00 Or its equivalent in Cash.

This Great Contest is Absolutely Free of Expense Send Your Answers Today!

This great contest is absolutely free of expense and is being conducted by the Continental Publishing Co., Limited, one of the largest and best-known publishing houses in Canada. That is your guarantee that the prizes will be awarded in absolute fairness and squareness to you and every other contestant. Frankly, it is intended to further introduce EVERYWOMAN'S WORLD, Canada's Greatest Magazine. You may enter and win any of the prizes, whether you are a subscriber to EVERYWOMAN'S WORLD or not, and, moreover, you will neither be asked nor expected to take the magazine or spend a single penny of your money to compete. Here is the idea.

EVERYWOMAN'S WORLD is so popular everywhere that it now has the vast circulation of 100,000 copies a month, but our motto is "*Everywoman's World in EveryWoman's Home.*" We want more Canadian readers to become acquainted with this famous publication. Therefore, when we acknowledge your entry to this contest, and you know your standing for the prizes, we shall send you a copy of the very latest issue and a review of many of the fine features soon to appear, without any cost to you. We shall also send, free of charge to all qualified contestants, a charming photo of Miss Mary Pickford with reproduction of her autograph in her own handwriting. Then, in order to qualify your entry to be sent on for the judging and awarding of the big prizes, you will be asked to assist us in carrying on this big introduction plan by showing your copy to just four friends or neighbours, who will appreciate this really worth-while Canadian magazine and want it to come to them every month. You will easily fulfill this simple condition in a few minutes of your spare time.

How to Send in Your Solution

Use one side of the paper only, and put your name and address (stating whether Miss, Mrs., Mr. or Master) in the upper right-hand corner. If you wish to write anything but your answers, use a separate sheet of paper.

Miss Mary Pickford, as Honorary Judge and three independent judges, having no connection whatever with this firm, will award the prizes, and the answer gaining 250 points will take first prize.

You will get 20 points for every name solved correctly, and 40 points will be given for general neatness, punctuation and spelling; 10 points for hand writing, and 100 points for fulfilling the conditions of the contest. Contestants must agree to abide by the decision of the judges. The contest will close at 5 p.m., May 31st, 1920, immediately after which the answers will be judged and prizes awarded.

DON'T DELAY! Send your answers to-day. This announcement may not appear again in this paper. Address your entry to:—

Movie Editor, Mary Pickford Contest,
Dept. **514** **EVERYWOMAN'S WORLD, TORONTO, ONT.**

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send **FREE** to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Write for free trial treatment.

Mrs. M. Summers
BOX 309 **WINDSOR, Ontario**

PILES Do not suffer another day with Itching, Bleeding, or Protruding Piles. No surgical operation required. Dr. Chase's Ointment will relieve you at once and as certainly cure you. 60c. a box; all dealers, or Edmanson, Bates & Co., Limited, Toronto. Sample box free if you mention this paper and enclose 2c. stamp to pay postage.

LUBRICATE, LUBRICATE AND STILL LUBRICATE

"Is Everything Oiled?" Should Be the "Eternal Question"

If this article could be printed in red ink or in some extra strong kind of italics, it ought to be done, though no other were thus accentuated, for lubrication is far and away, the most vital subject connected with the care and maintenance of motor cars. There are many "chances" that a motorist can take with his car and "get away with them," without injury. He may skid his car without hitting the curb, careen around corners on two wheels without tipping over and shave a 5-ton truck without losing even a hub-cap, but he cannot neglect lubrication without paying the penalty. The consequences are inevitable and will infallibly become aparent later is not at the time. Just as sure as two working surfaces run dry, they will wear out and nothing can prevent them. All operative parts of a car must be lubricated all the time and not part of the time by fits and starts. There must be no break in the condition of perfect lubrication, for such an interval may be sufficient to destroy or irreparably injure expensive parts. After injurious wear has occurred, flooding the affected surfaces with oil, is fruitless, and repentance is of no avail. Lubrication must be absolutely continuous and uninterrupted or its purpose is defeated. If two new cars of the same model were taken out upon the road and one of them were stopped by being run into a telephone pole, while the other was run until it stalled for lack of lubrication, it is not at all unlikely that the former car would be worth the more, for the damage to it would be mostly upon the surface, and such as could, at reasonable expense, be fully repaired, but the other car would probably have received vital injuries of a concealed and deep seated character, such as scored cylinders, and pistons worn out, wrist-pins and burned-out bearings, the repair of which would entail costly replacements and very extensive labor. Damages from lubrication failures are concealed and cankerous and the difference between these two supposititious cars is somewhat that between two men, one with a broken leg, the other with a leaky heart. Engines may be carbonized and mechanism made sloppy by too much oil, but no car was ever permanently injured by excessive lubrication while practically all are injured by fitful or insufficient oiling. It is hoped that we have "put this across," for it is the most important "Hint For The Motorist."

ESCAPING GREASE CAUSES CLUTCH SLIPPAGE

W. L. writes: . Grease from the transmission case of my car, works out along the shaft into the bell-housing that surrounds the cone-clutch and, getting onto the leather lining, causes it to slip There is a felt washer in the transmission housing that is supposed to prevent this. Can this be packed tigh enough to prevent the escape or is some grease expected to pass into the clutch housing and drop out of the hole in its bottom? Would a cork packing be better than the felt?

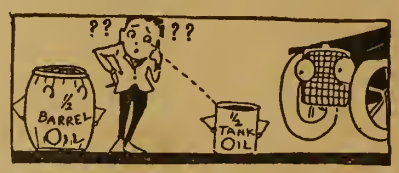
Answer: A new felt washer of liberal size, so that it fills very tightly, will very likely stop your trouble temporarily, but we doubt if it will per-

manently, as the felt compresses very soon. No grease is supposed to pass the washer, but what does is supposed to escape through the hole in the housing. We hardly think that a cork packing would be better than the felt. If there is room on the shaft, between the clutch and the transmission housing, try winding a narrow strip of felt spirally around the shaft, fasteing it tightly in place with shellac and a wire band at each end. Wind the spiral in the direqtion which will cause it to act to carry back towards the transmission housing any grease that works out of it. If you cannot do this, you might make a split ring out of brass and fasten it around the shaft, making the ring of fair size, with a sharp edge. The tendency would be for any grease, working along the shaft, to be thrown off of the edge of this into the housing, from which it would escape, rather than following along to the leather lining.

OIL INQUIRY

J. W. writes: I have a half tank of heavy oil and a half barrel of medium oil and am short of room to store them in . Is there any harm in mixing them together in the same receptacle?

..Answer: Assuming that they are both the same kind of oil, cylinder oil we imagine and differ only in body we cannot see that it will do any

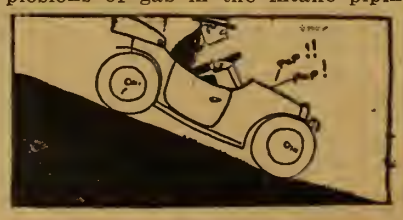


harm to put them together. The result will be an oil with a oody intermediate between the two constituent oils and, if you have use for an oil o. such a body, we can see no objection to making the mixture .

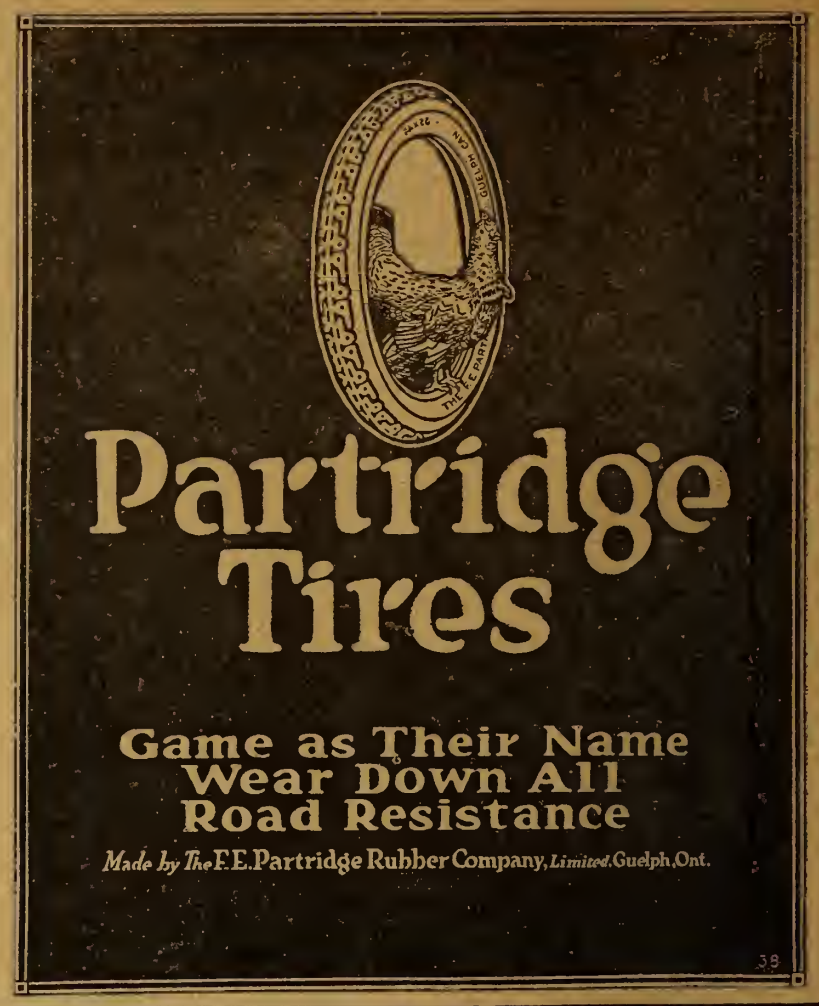
CAUSE OF BACKFIRE WHEN COASTING

E. W. asks: What is the cause of the explosions that occasionally are heard when a car is coasting down a hill with the engine in gear and throttled way down?

..Answer: These are probably explosions of gas in the intake piping,



caused by flame persisting in a cylinder through its power and exhaust strokes and until the inlet valve opens to take in the next charge. When an engine is being turned over by the forward motion of its car, going down hill, it frequently is caused to run very much faster than it would turn itself over with the very small amount of gas furnished it through the nearly closed throttle and so short a time elapses between firing and the next intake opening that ignition of the fresh charges sometimes occurs. When very closely throttled, considerable burned gas remains in the cylinder in proportion to the very small fresh charge drawn in, and this, together with possible air leaks, tends to make the combustion rather slow and favors the persistance of the flame the inlet valve next opens.



Partridge Tires
Game as Their Name
Wear Down All
Road Resistance
Made by The F.E. Partridge Rubber Company, Limited. Guelph, Ont.

REPAIR TIRE TREAD CUTS.—THEY ARE "THE LITTLE FOXES THAT SPOIL THE VINE"

The tread is the water-and-dirt-proof protection of the vulnerable body of a tire and is also the best wear-proof material available. It is like the tight roof of a house that keeps the timbers from decay. If its tread is kept intact, a tire lasts until its body is worn out mechanically. When, however, the tread is cut, the tendency is for this cut to deepen, under driving stresses, until it extends entirely through. Then its edges begin to loosen, the cushion material pulverizes and works out, tread separation progresses and dirt and water enter to mildew and rot the fabric. The dirt, constantly being forced in, pries the tread loose over a constantly increasing area and a blister forms, which, in time, breaks, leaving loose flaps of tread which fail to protect the fabric from road friction. The fabric, already deteriorated by dampness, then wears down rapidly until a blow out occurs. Every householder who repairs his roofs, before plastering begins to fall, ought to repair his tire cuts before the fabric is injured. Cuts should be looked for frequently and, at their first appearance closed with cement and plastic. If they are neglected too long, they cannot be repaired so readily. Many tire dealers repair tread cuts free, as part of their "service," thus relieving the owner of an irksome though important maintenance operation.

WORN OUT HIGH SPEED CLUTCH

T. A. M. writes: My Ford, when changing from low to high gear, gives a series of jerks, lasting from thirty to fifty feet, after which it runs smoothly as long as high gear is engaged. This car is an old one and can it be that additional discs are neded in the cluach, or is there some other explanation? The engine is in good condition and the fault cannot lie there.

Answer: We fancy that the trouble is this: One set of clutch discs carry projections, which fit into keyways in the inside of the transmission

drum and, after long usage, there is considerable wear of the projections and of the keyways. This permits the discs, when slid along the shaft to "cock up" somewhat, instead of keeping exactly parallel and, when this happens, there is a tendency toward a chattering action such as you describe, which continues until the discs have been flattened together as they should be to give full contact surface. We are afraid that you will have to renew the transmission drum and the large discs of the clutch.

HARSH CLUTCH ACTION

E. W. writes: My car starts on low gear with a jerk, but somewhat less jerkily on reverse. What is the mat-

ter and how can the defect be remedied?

Answer: If yours is a leather faced conc-clutch, try softening the facing with neatsfoot oil, but if the leather is too thin or has been burned, you will have to replace it. If there are springs between the leather and the clutch body and these have become weak, they should be replaced. In case your clutch is of the lubricated multiple-disc type, you may need to use a llttle heavier oil on the discs to cause them to grip more gradually. If this is a dry disc clutch, the facings may have worn thin and need to be renewed. Not knowing what your car is, we cannot tell what form of clutch you have. Is the pedal adjustment correct, so that the motion of the engaging parts is slow at the instant that they come in contact? The less pronounced jerk in engaging reverse is due to the lower gear ratio and the fact that the transmission of power is more indirect, with more lost motion that gives a slightly greater cushioning effect to the sudden clutch action.

BRAN TO STOP RADIATOR LEAKS

A. D. S. writes: The radiator of my car has several small leaks in it and a friend tells me that, if a quantity of bran is put into the water and the engine is run, these leaks will be stopped up. Is this a good thing to do?

Answer: We do not advise it. Bran, if put into the water, will often find its way into leaks and plug them, but it also is likely to clog the fine passages, especially those of cel-

lular radiators and, by coating the lnside surface of the tube, it reduce thir capacity for giving up heat from the water to the air. As it is impossible to make solder stick to other than a perfectly clean metallic surface, the use of bran and other similar materials makes a soldered repair more difficult. There are radiator erpairing compounds less objectionable to use than bran, but in our belief a soldered repair is more permanent and satisfactory than any other kind, although it costs more at the time.

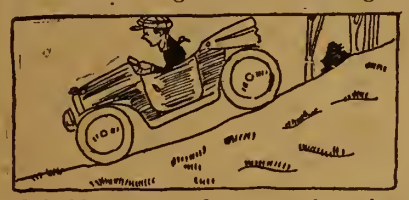
TOO RICH OR TOO LEAN, WHICH?

Many motorists do not keep in mind the fact that, with a car in perfect mechanical condition and its engine satisfactorily ignited, performance and economy depend mainly upon one factor—the character of the fuel mixture. A fraction of a turn on a carburetor adjustment is often capable of determining whether a car shall "eat up" the hills or shall balk at the slightest grade and whether it shall be thrifty or spendthrift with fuel. The question "Is my Carburetor Correctly Adjusted" is of paramount importance and one which every motorist should frequently ask of himself or others. If the answer is "Probably Not" it is then the problem to find out whether the fuel mixture furnished is too rich or too lean in gasoline and to correct the proportion of air and feul. The following suggestions should enable one to decide whether the mixture is too rich or lean. Among signs of over-richness are fouling of the insulation of some or all sparkplugs with black, dry soot; the rapid carbonization of the engine; low fuel economy as compared with that of similar cars; irregular missing at times and explosions in the muffler; unusual heating of the radiator; slow acceleration and inability to attain normal speed or pulling power; black smoke in the exhaust and a yellow or yellow-edged flame to the exhaust, when viewed as it leaves the muffler cut-out. It is only when the mixture is very gretly over-rich that many of these signs are apparent. Indeed an unnecessarily rich mixture may be used without causing sooted and short-circuited plugs, or dimunition of power, and the most reliable sign of moderate over-richness is low gasoline economy and the ability of the engine to run powerfully before it is hot, even though the carburetor is not choked. A lean mixture is indicated by, hard, starting, unless fully choked; liability to stall; slowness to get into full action after a cold start; explosions in the intake and carburetor; inferior acceleration and pulling power, with no great lack of speed on level roads; some tendency to overheat; a tendency to "labor" when heavily loaded at low speed; perfect freedom of plugs from gasoline soot and a short greenish-blue exhaust flame from the cut-out. Even a moderate degree of unde rrichness so reduces engine power as to make the use of a car so affected almost out of the question, which over-richness may be quite extreme without producing so pronounced an effect upon pedrformance; for which reason, over-richness is more common than under-richness and longer tolerated.

BRAKING WITH THE ENGINE

C. M. asks: Does it do any harm to make the engine hold back while the car is going down hills, instead of using the brakes?

Answer: No. It is considered the best practice. In coasting hills, the throttle should be closed as much as possible, the clutch kept engaged and the brakes applied only sufficiently to assist the braking effect of the engine

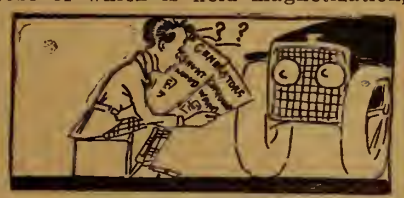


and hold car speed to a safe value. This procedure greatly reduces the rate of wear of the break linings. Some people also, cut off the spark and, with engines that tend to overheat, this assists the cooling process. On very steep down grades, some operators engage a lower gear, throttle the engine and switch off the spark. This gives the engine a powerful retarding effect that calls for very little help from the brakes.

SHUNT AND COMPOUND GENERATORS

V. F. W. asks: What is the difference between a shunt wound and a compound wound generator? What is meant by a series winding?

Answer: The difference is in the method of applying the current which excites the field magnets. In the tormer, there is a circuit the only purpose of which is field magnetization,



which consists of rather fine wire, wound in many turns around the field magnets. This circuit commences at one brush and ends at the other main brush—or at the "third brush"—and carries a relatively small current but nearly the full voltage generated. The latter type is a combination of a shunt wound and a series wound generator. Its magnets carry not only the shunt winding, but also a series winding, which is a coil of a rather small number of turns of quite coarse wire that carries the whole useful current produced by the generator. The series circuit starts at one main brush, includes the series field winding and ends at the other main brush. In a compound generator the shunt and series coils may both act to increase the field magnetism or the latter coil may act to reduce the magnetism produced by the shunt coil. The latter is usually the case with motor car generators.

FRONT CYLINDER OILS SPARK-PLUG

P. J. S. writes: The spark-plug, in number one cylinder of my Ford, carbonizes so rapidly that I have to clean it every other day, in order to stop the engine "skipping." The plugs in the other cylinders do not carbonize. Do you think I need a

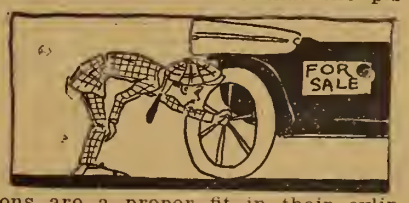
ne wring at the top of this piston or what is the cause of this trouble?

Answer: The chances are that you will have to have not only a new top ring, but a full set of rings for this cylinder before long. If you find by cranking the engine over the compression stroke of this cylinder, that there is considerable hissing of gas past its piston and that the resistance to motion of the crank soon ceases, new ring at the top of this piston or ever, before changing piston rings, you might try the expedient of drilling a one-eighth inch hole through the oil supply pipe so that a part of the oil is discharged into the splash basin of number two cylinder and not all of it into the front compartment. This is sometimes found to prevent excessive oiling of number one cylinded—a failing which is quite common with these engines.

INSPECTING A USED CAR

A. N. writes: Please inform me what parts should be specially inspected in buying a second hand automobile?

Answer: In a general way the working parts which have bearing surfaces that are subject to wear. You should make sure that the pis-



tons are a proper fit in their cylinders, so that good compression may be insured, that the bearings of the engine shafts are not loose and likely to cause pounding noises; that the road wheels are not wabbly on the axle ends; that there is no undue looseness in the steering-gear; that the spring ends have not worn out their eyes and pins; that the unversal joints have not developed excessive lost motion, that the transmission gears still have their teeth intact and their bearings in adjustment and that the clutch is in good operative condition, and that the brake linings and operative devices have not worn to a dangerous extent.

MALTESE CROSS TIRES

STAMINA

Stamina—that is the word—stamina, the in-built quality to endure. It is this enviable quality which empowers Maltest Cross Tires to yield mileage in excess of xpectations.

FEEDING THE BREEDING HOGS

Swine that are used for breeders need different feed from those that are to be fattened for the market.

The breeding hog should not be fat at any time that is, fat from the market standpoint. They should be kept growing on nutritious food from the time they are pigs and should never be fed the amount of corn, sugar beets and other fattening foods that the market hogs sometimes get. Excessive fatness destroys the power of breeding in many animals. The professional breeder takes care to so feed his animals that are to be sold for breeers, that they will do good work when they go into the hands of the farmers who buy them. Very frequently, however, some farmers begin at once to undo the work of the breeder by feeding corn in excessive quantities. Among the feeds that should be given is skimmilk, which is very good, as it contains a large amount of protein, and is bulky. Clover is an exceptionally good feed in the green state and even clover steamed proves very nutritious. Oilmeal cake contains much nutritment of the right kind. When alfalfa can be had it is also good . Oats in various forms furnish the exact kind of nutriment most serviceable for the breeding animals.

The sow that is carrying pigs needs a large amount of protein food on account of the extra bodies she is building up. But care must be taken not to have too much protein in proportion to other elements as starch parts are also needed. The starch forming elements should be five or six times the protein elements. This is about the composition of oatmeal. Bran is highly nitrogenous feed and should be balanced with something else when it is fed. All plants that have pods are rich in protein and are thus good materials out of which to make food for the breeding hog. The fall of the year is not nature's season for pig growing. The weather is cold, green food is gone when they need it most and the pigs must be kept in a large part of the time to keep them out of the storms and snow. What nature fails to supply must be supplied by us—warm bed, feed in abundance, and plenty of water. It is absolutely necessary to give fall pigs the best care one possibly can. Young pigs carried through winter are harder to fatten for it takes a quantity to get them into a condition where they will not be stunted. If they are any ways old enough at all sell them for the most you can get and put your crop into young hogs again in the early spring.

An item which is as important as any is to give brood swine in winter, water or slop from which the chill has been removed. A slight trial at feeding slop slightly warmed in freezing weather will tell its own story. Hogs will partake of considerable more of warm drink than of cold and do not suffer the chilling eflects. No animal can consume a lot of ice cold food and drink in cold weather. It chills their bodies just as a cold meal serveg in an unheated room chills the human body. It works havoc with the digestive organs.

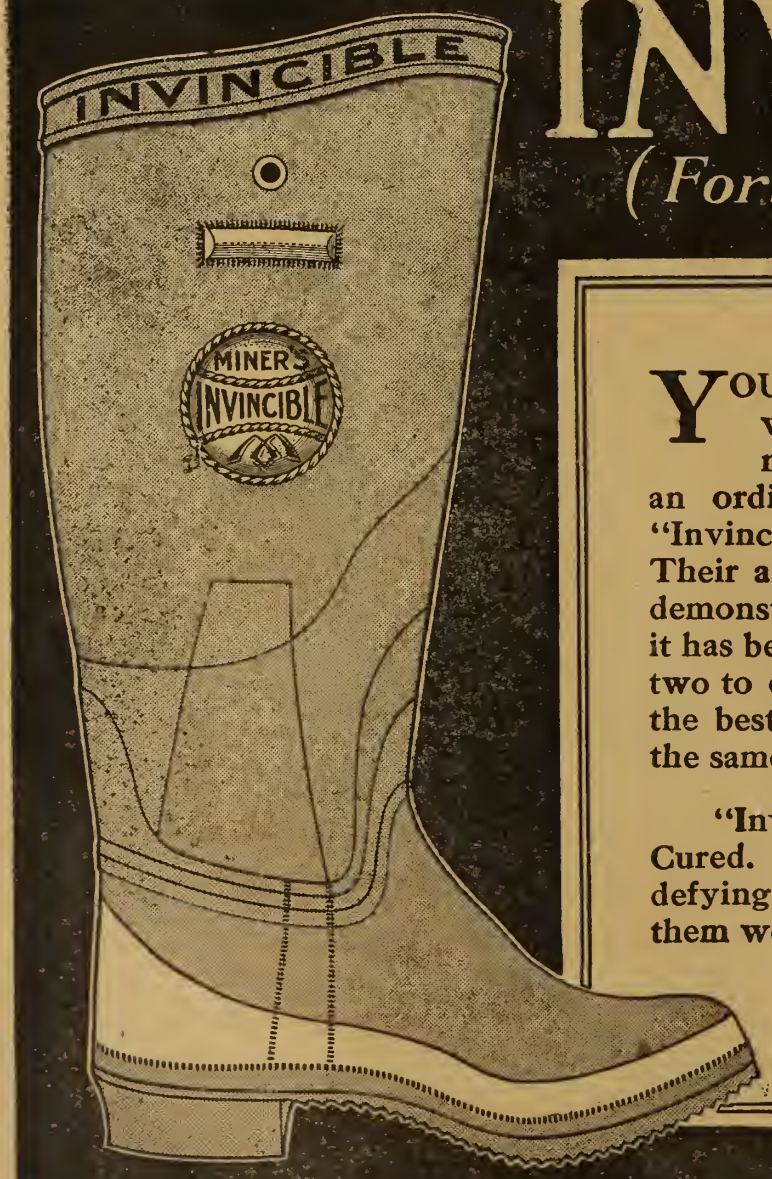
Another thing experience has taught is that sows or pigs (or any other hogs for that matter) should be kept off the manure pile during the winter. The manure heap not only causes colds in the head but also is in a state of heating more or less continuously. Pigs that are permitted free access to the barn yard always go to the manure pile to sleep in preference to their own bed. They do this on account of the warmth generated by the manure. And this is where the harm is done. When they pile up in the manure they are heated by a steaming process. The vapor from the manure makes them wet and when they get up and go out into the cold again they are easily chilled. The result is that they will turn no profit for the food consumed. Young pigs, especially, are easy chilled and should be kept away from the manure heap.—L. K.

COW POX DISEASE IN DAIRY HERDS

One of the most annoying diseases that affects the udder of a cow is that of cow pox. It is never considered seriously by the average dairyman, but when once it has got a hold on a herd it materially lessens the milk yield. It affects the teats, and renders milking difficult or almost impossible. It is also very contagious and is communicated by a germ reproduced by the disease. Before a pox becomes discoverable by the eye, a milker can feel it as a hard nodule under the skin. The cow will show uneasiness at milking because of the pain saused when the milker's hand passes over the part in the teat where the pox is situated, and will ultimately make its appearance. In a few days these nodules appear at the surface in the form of round, inflamed spots, somewhat raised above the skin, and depressed or pitted in the centre. In three or four days the spots will be found to contain liquid matter, and, is care is not taken, they will become broken and become raw sores, that are difficult to heal. Many times they end in results disastrous to the utility of the cow and cases are recorded that have ended fatally.

The Contagious Stage

After a time the liquid, that first appears in the pox becomes a thick yellow pus, which dries into a scab, and in time becomes loose and falls off, being replaced by a newly formed skin. It is at this stage that the



INVINCIBLE
(Formerly Called Monarch)

YOU can wear them around the barnyard and they will withstand the chemical action contained in manure, which so rapidly destroys the life of an ordinary boot. That is just one reason why "Invincibles" have taken so well with the farmer. Their ability to withstand chemical action has been demonstrated in chemical factories and pulp mills where it has been proved that they outwear the ordinary boot two to one. They do that in these industries where the best boot procurable is necessary. They will do the same thing for the farmer.

"Invincible" Rubber Boots and Shoes, are Pressure Cured. It is the high Pressure Process and the time defying materials that go into "Invincibles" that makes them wear so long.

The Miner Rubber Co., Limited. 2

milker generally gets anxious over the annoyance it causes at milking but is unconscious that he has spread it perhaps all over the herd. He exercises his special attention to get this first pox cured and no sooner has it vanished than another appears. This is its history as it appears to the milker, when one case is out of the way, another appears, and in the herd, and it may continue for a whole season, almost defying all efforts to get rid of it.

The disease spreads readily from cow to cow, is usually conveyed by the milker whose hands or clothing become infected with virus. It is also readily communicated to mankind, and is sometimes found in horses.

The matter contained in the pox is the true vaccine virus used for inoculating persons as an antidote to the once dreaded form of small pox so fatal a century ago. The virus often remains permanently in a barn, and will cause every heifer which comes to milk in it to contract the disease. When this is found to be the case the barn should be thoroughly disinfected by sprinkling the floor freely with carbolic acid and white washing the walls, and the stalls and fittings.

Cure and Prevention

When once a scab has formed it is best to allow it to get thoroughly dried before taking it off. To remove the scab before it has dried up will only spread the disease more and more on the animal affected and over others that may come in contact with it. To prevent the scabs coming o fftoo early the teat should be rubbed with vaseline jelly, which is both softening, and is an tntiseptic being a preparation from petroleum. A daily dose of one ounce of hyposulphate of soda in the feed should be administered, as long as the pox lasts on the teat. This dose should also be given to the other cows or heifers in the herd as a preventative or as a means of very much lightening the results of an attack upon them.

The ailment is a blood disease, and as the blood has been subjected to the action of a special virus by which the disease has been produced, the milk therefore being a direct product from the blood, will be more or less contaminated. The cow should be kept warm and free from exposure to rain or inclement weather, so as to prevent complications. Sometimes the disease passes off with a very slight eruption with scarcely any trouble to the cow first affected, but it will spread very quickly to others, and these will experience a core serious attack and prolonged illness. Dairymen should be on the guard at all times and use all necessary precautions as soon as they perceive the first inlications of the disease in their herds. All sick and affected animals should be isolated. They should be milked after all others are finished, and the person who milks them should not go near the clean and unaffected cows. The one ounce dose of hyposulphate of soda should be given daily in the feed for at least ten days, gradually reducing it after that period to one-fourth the dose. A slight fever prcedes the outbreak in the udder, and the above medicine has a cooling effect and lessens the spread of the disease.

ARGENTINA A COMING DAIRY COUNTRY

That Agentina is makin a wonderful growth as a dairy country is shown by recent figures given in the reports on foreign markets issued by the U. S. Department of Agriculture. From this repor we note that a recent shipment of butter from Argentina consigned tothe British Government consisted of 129,000 cases, representing a net weight of 7,266,486 lbs. It was valued at $2,644,833.40. The exports of butter for the first three months during the current year amounted to 5,800 tons, or more than was exported during the whole year of 1916.

Many enquiries from South America for cows are being received in the United States and the figures just quoted indicate that there will be a vast market in the Latin-American countries for purebred dairy cattle.

WONDERFUL RESULTS OF GRADING UP

Albert Klevesodil, of Shawano, Wis., formerly owned a scrub bull. In 1911 he hauled milk to a cheese factory, and during the year he delivered 44,228 pounds. Hhe then purchased a purebred sire to cross with his scrub sires. The first cross produced 14 of his present cows and six of his present milking heifers. From the same number of cows he had in 1911, last year he delivered 152,605 pounds of milk. Eight years of crossing with a purebred sire made a difference of 108,337 pounds of milk in his herd.

MILK IN THE CHILD'S DIET

A state-wide campaign for more dairy cows in Florida finds a convincing argument in the results obtained by a home demonstration agent who conducted experiments for several months in one of the counties of that state to determine the value of milk in the diet of children. Of the 2,000 children weighed and measured, those up to or above the standard were found, almost without ,exception, to be receiving generous rations of milk. Those much under the standard had been getting little or no milk. Furthermore, when milk was added to the diet of the underweight children, they began, almost immediately, to show gains. With this evidence before the people of that section, it is not surprising to learn that dairy cows are rapidly increasing on their farms. The right way to enthrone a truth is to demonstrate it.

MARKETS.

LIVE STOCK MARKETS

Toronto, Nov. 22.—Cattle, receipts 3,100. Trade was steady, choice butchers having an active demand. One choice steer, weighing 1,170 pounds, sold at $13.76 and a straight load of equal weight at $13.00 per 100 lbs. Choice cows had a brisk trade a few sales being made at $11.50 with good cows at $9.75 to $10.50. Canners were steady, with stockers and feeders having a ready sale. Quotations: Heavy beef steers, $13.00 to $13.75; butcher steers, choice, $12.00 to $13; good, $10.50 to $11.50; medium, $8.00 to $9.50; commonfi $6.00 to $7.50; butcher steers, choice, $11 to $12.00; medium, $8 to $9.50; common $6 to $7.50; butcher cows, choice, $9.25 to $10.50; medium, $6.50 to $8; canners and cutters, $5.25 to $5.75; butcher bulls, good, $9.25 to $10.50; common, $6 to $7.50; feeding steers, good, $9.75 to $10.50; fair, $9.00 to $9.50; stockers, good, $8 to $8.75; fair $7 to $8.

Calves.—Receipts 164. The calf trade was steady, numerous sales being made at 16 to $18 per hundred. Quotations: Choice $16 to $18; medium $13 to $15; common $7 to $11.

Milch cows, choice, $125 to $175; springers, choice, $100 to $150.

Sheep.—Receipts, 4,771. The lamb trade developed a stronger tone during the day and a few sales were mad at an advance of 25c. Quotations: Ewes, $7 to $9.25; lambs, $13.25 to $14.25.

Hogs.—Receipts, 2,700. Packers refused to advance their bids and commission firms were forced to accept a cut of $1 per hundred on all hogs.

Quotations: Fed and watered basis, Selects, $16.75; lights $14.75; heavies $15.75; sows $11.75 to $14.75.

FRESH EGCS AT NEW HIGH LEVEL

Montreal, Nov. 22.—The demand for new laid eggs still continues much in excess of the supply and prices have advanced on all Canadian markets. On the farmers' market the retail price ranged from $1.10 to $1.30 per dozen. On the Ottawa market up to 95c was paid, and on the Vancouver market $1.20. From some country districts reports state indications point to hens and pullets beginning to lay more freely pullet eggs being particularly noticeable in the average current receipts. It will be some time however, before the increase in production will matrially influence the market. The average current receipts still contain an excessive quantity of stale held stock, which is very unsatisfactory. Ontario country truck shippers report having paid from 60c to 65c for straight gathered eggs during the past week, and making sales at 68c to 70c f. o. b. Some States' fresh reported arriving at Toronto costing 66c f. o. b. Chicago.

The situation in British Columbia is being helped by importations of States and Australian fresh, the latter jobbing at 70c.

Storage eggs are moving into consumpton freely at a slight advance in price for the better grades. Undergrades are dull and unchanged. United States storage eggs are coming in freely to supply local consumption in the alrge centres, and smaller distributing points are also importing some. They cost from 54c to 55c delivered Toronto.

Glasgow, Nov. 20.—Market improving; Irish jobbing 50s., noo allotments arriving. Canadian fresh 38s., storage 35s., States storage 30s. to 32s 6d. Demand brisk for aCnadian fresh and storage. States in eettbr sympathy. Supply aCnadian scarce; States plentiful; retail 3s 3d to 5s 6d.

THE PROVISION MARKET

Montreal, Nov. 22—In spite of the report from Toronto yesterday that packers were not operating and standing out of the market for a cut in prices of 50c to 75c per 100 lbs., a stronger feeling prevailed in this market today and prices were 10c per 100 lbs. higher, with a good demand, and sales of selected lots were made at $17.25 to $17.35 per 100 lbs. weighed off cars, the bulk at the outside figure and some drovers asked as high as $17.50. On account of the colder weather there was a better demand from butchers for country dressed light weight hogs, and as supplies were not large, prices advanced 50c per 100 lbs., with sales at $22 to $23 per 100 lbs., btu there was no change in city abattoir fresh-killed hogs, which sold at $25.

The market for smoked and cured meats was without any new feature to note, prices for all lines being steady under a fair demand from local and country buyers for small lots to meet actual wants, and a steady trade was done, with sales of 8 to 10-lb. hams in a jobbing way at 35c to 36c per lb., 12 to 15 lbs., at 33c to 34c and heavy weights at 32c, while breakfast bacon sold at 43c to 44c, Windsor selected bacon at 45c to 47c, and Windsor boneless bacon at 48c to 49c.

There continues to be a steady demand for lard for domestic account and the market is fairly active, with sales of pure leaf grades at 31c per lb. in 20-lb. wood pails, and at 32c in 1-lb. blocks.

The receipts of provisions today were 100 packages lard, 230 boxes hams and bacon and 7,823 packages tinned meats.

Chicago, November 22.—Assertions that there had been foreign repudiation of purchases of lard counted as a special weight on the provision market. Prices closed unchanged to a setback of 52c. Future quotations were:

	Open	High	Low	Close
Mess Pork, per bbl.—				
May	.....	$32.00	$31.50	$32.00
Jan.	.....	.....	.....	$33.50
Lard, per 100 lbs.—				
Nov.	.....	25.10	25.00	25.00
Jan.	23.50	23.75	22.95	23.32
Short Ribs, per 100 lbs.—				
Jan.	.....	19.00	18.45	18.45
May	18.50	18.55	18.15	18.15

Cash prices closed:—Pork, nominal. Lard, fi25.10. Ribs, $19.25 to $20.50.

DAIRY PRODUCE TRADE

Montreal, Nov. 22.—The receipts of butter today were 711 packages, as compared with 176 for the same day last week and 2,213 packages for the corresponding date a year ago. In sympathy with the further advance of 1c per lb. in the New York market yesterday and the continued good demand for supplies here for both local and export account, a strong feeling prevails in the market and prices are steadily tending towards a higher level. A good business was done and the market is fairly active, with sales of round lots of finest creamery at 65½c per lb. The market for oleomargarine is stronger and prices are 1c per lb. higher, with sales in a jobbing way at 38c per lb. in 1-lb. blocks.

We quote wholesale jobbing prices as follows:

Pasteurized creamery...66c to 66¼c
Finest creamery.....65½c to 65¾c
Fine creamery.....64½c to 64¾
Finest dairy.....59c to 60c

The receipts of cheese today were 1,830 boxes, as against 3,259 for the same day last week and 2,735 for the corresponding date a year ago. There was no important change in the condition of the market today, business being rather quiet owing to the absence of any important demand, but the general impression here is that what few lots of cheese are on the market unsold will all be wanted sooner or later and probably at much higher prices.

Belleville, Ont., Nov. 22.—At today's meeting of the cheese board there were offered 573 boxes of colored. About 300 sold at 28½c. alance sold after the board at 28½c.

New York, November 22.—Butter, firm. eRceipts, 16,499 tubs. Creamery, higher than extras, 72½c to 73c; creamery extras, 92 score, 72c; firsts, 62½c to 71c; packing stock, current make, No. 2, 49½c to 50c. Cheese, steady. Receipts, 4,692 boxes. State, whole milk, flats, current make, specials, 32½c to 33c; do. average run, 31½c to 32¼c; State, whole milk, twins, current make, specials, 31½c to 32c; do. average run, 31c.

MILLFEED AND ROLLED OATS

There were no new developments in the market for millfeed, the feeling being still unsettled on account of the continued cutting in prices by the smaller Ontario millers. The demand for supplies is only fair for the season with sales of car lote of bran at $43 to $45, and shorts at $50 to $52 per ton, including bags, ex-track, while broken lots of pure barley meal is selling at $68, mixed grain moullie at $66, and dairy feed at ..56 per ton, including bags delivered to the trade. The market lots of standard grades quoted at $4.50 per bag of 90 lbs., net cash, and at $4.55 with terms for prompt delivery, and it is reported that these prices are being shaded in some cases.

THE BALED HAY MARKET

Montreal, Nov. 22.—A good steady trade continues to be done in baled hay and the market is moderately active with a firm undertone. The demand is principally from outside buyers for supplies and, in consequence, there is no accumulation of stock on spot to speak of. The trade for local account is quiet, with sales of car lots of good No. 2 timothy hay at $24 to $25, No. 3 timothy hay at $22 to $23, and clover and clover mixed hay at $21 to $21.50 per ton, delivered.

ORDERS ISSUED BY WHEAT BOARD

Winnipeg, Nov. 22.—The Canadian Wheat Board today ordered that until further notice, bran and shorts maximum wholesale prices shall be $45 and $52 per ton, respectively, net weight in 100 lb. jute sacks f.o.b. Montreal.

Another order provides that the standard of flour manufactured in Canada be the standard set by the Canadian Wheat Board and designated as government standard spring wheat flour, and government standard winter wheat flour, and that the maximum wholesale price for the former shall be $10.90 per barrel, basis 98 lb. net jute bag, and for the latter $10.10 per barrel f.o.b. Montreal.

It is ordered that no flour mills in Canada shall enter into calls for delivery of flour, bran and shorts for a period in excess of thirty days, and that all sales shall be made subject to regulation of the board.

The above order means that the maximum prices of bran and shorts in the Maritime Provinces, in car lots, shall be Bran, New Brunswick points, $47.90 per ton; Sackville to Halifax, $48.19; Sydney, 49.20.

Shorts, New Brunswick, $54.90; Sackville to Halifax, $55.10; Sydney, $56.10.

If you can use a car of feed with a few barrels of flour, write the Maritime Farmer. Get your neighbors to co-operate with you. We have other feeds in car lots at cost to offer readers. BE YOUR OWN MIDDLEMAN.

BLASTING FOR TREE PLANTING

There is no longer any question regarding the relative advantages of blasted holes over spade-dug holes for tree planting. Dynamite has established its claim; but there is considerable discussion of the idea that fertilizer driven into the soil by blasting would result in better growth of trees so planted. Blastng does not act this way. It simply makes available the fertilizing elements in the soil.

Fertilizer is a good and powerful medicine, but medicine is not always needed. Able physicians prescribe fresh air, water and exercise as a prompts the question, is not blasting alone sufficient stimulus for tree development?

To answer this problem, let us see just what happens when a tree hole is blasted. Soil that is loose and sandy to a depth of five or six feet needs no blasting; but when the ground is hard and tight, blastisg is very helpful. A flat spade, especially in damp clay, tends to pack the earth tighter around the sides of the hole and the tree roots have a hard struggle to penetrate the soil in search of food and water.

Blasting mellows the ground to a depth of five or six feet asd throughout a circular area four to five feet in diameter, making it easy to dig the hole and plant the tree correctly.

It creates a porous, water-absorbing condition in the subsoil that makes the tree comparatively drouth-proof, stopping the big, first year loss.

It makes root growth easy and makes tons per acre of new plant food available, hence speeds up the growth of the tree and makes it fruit one to two years earlier.

It creates drainage and prevents stagnation of water on the surface.

In old orchards that were planted by the old methods and have ceased to bear well, it is of great value is rejuvesating the old trees, causing them to yield heavily.

It helps to destroy fungus, nematoid and other orchard soil diseases, hence makes it possible to plant new orchards where old ones have been removed without waiting several years to rest the land and get rid of the diseases.

At a cost of little or no more than of old-style planting, it causes at least a year's earlier return on the investment in new orchards and greatly increased returns theerafter as compared with spade-set orchards.

In soils where plant food is lacking, fertilizing should be resorted to; but not before the trees have been given access to the life-giving humus which needs only breaking up to make it available.

PROTECT FRUIT TREES FROM MICE

(Experimental Farms Note)

Thousands of trees are injured in Canada every year by mice, and in the newer districts a large number by rabbits also. All this could be prevented if the farmer or fruit grower would use the information available and protect his trees from mice. Some years there is less injury than othrs, and this fact leads to carelessness, and when a bad year comes the trees are unprotected.

While the depredations from mice and rabbits in winter vary from one year to another, depending on the scarcity or abundance of food, the number of mice which are in the vicinity, and the character of the winter, the injury is always greatest when the orchard is in sod, and when there is rubbish lying about; hence the latter should be removed before the winter sets in. As mice may be expeced in greater or less numbers every winter, young trees should be regularly protected against their ravages. Mice usually begin working on the ground under the snow, and when they come to the tree they will begin to gnaw it if it is not protected. A small mound of soil from eight to twelve inches in height raised about the base of the tree will often prevent their injuring the tree, and even snow tramped about the tree has been quite effective, but the cheapest and surest practice is to wrap the tre with ordinary building paper, the price of which is small. Tar paper is also effectual, but trees have been injured by using it, and it is well to guard against this when building paper will do as well. After the paper is wrapped around the tree and tied, a little earth should be put about the lower end to prevent the mice from beginning to work there, as, if they get a start, the paper will not stand in their way. It may be stated, however, that among several thousand young trees which have been wrapped with building paper for years at the Experimental Farm, Ottawa, there have been practically no instances where the mice have gnawed through the paper to get at the tree. The use of a wire protector, or one made of tin or galvanized iron, is economical in the end, as they are durable.

There are a number of washes and poisons recommended for the protection of fruit trees and the destruction of the mice and rabbits, but none of these is very satisfactory, as, if the mice or rabbits are numerous, the poison has not sufficient effect upon thesm to prevent injury altogether. The following method of poisoning has been found fairly successful for mice, but rabbits are very difficult to deal with.

Make a mixture of one part, by weight, of arsenic with three parts of corn meal. Nail two pieces of board each six feet long and six inches wide together so as to make a trough. Invert this near the trees to be protected and place about a tablespoonful of the poison on a shingle, and put it near the middle of the run, renewing the poison as often as is necessary.—W. T. Macoun, Dominion Horticulturist.

LOCATING THE POULTRY HOUSE

In locating a poultry house it is best to select an elevation having a natural drainage away from the building, for damp ground means cold ground. If the house can be built in the lee of a windbreak or a hill, or in front of farm buildings, so much the better. A dry, porous soil such as sandy or gravelly loam, is preferable to clay soil, for the former is more easily kept in a sanitary condition. If it is impracticable to select a soil that is naturally dry, the soil should be made dry by thorough underdrainage. A purely sandy soil should not be selected, for a soil not good enough to support plant life is unfit for poultry.

As sunlight and warmth are essential to success, the buildings should face the south; other things being equal, they will be warmer and drier. When a direct southern exposure can not be obtained a southeastern is preferable to a southwestern exposure, for fowls seem to prefer morning to afternoon sun. A gentle slope facing the south is the most suitable.

TIMES PER DAY TO FEED POULTRY

Some poultrymen feed their flocks twice a day. The best plan is to feed fowls in confinement 3 times a day and those having free range in summer twice a day. When there is a very long interval between feeds it is difficult to keep fowls busy which are kept in confinement. Idle fowls often contract bad habits, such as feather pulling and egg eating, besides going out of condition from lack of exercise.

In case it is not convenient to feed three times a day, the moistened mash may be fed in the morning, and at the same time the noon feed of grain may be scattered in the litter, which will keep the fowls busy a great part of the day.

For those who can not conveniently feed their fowls early in the morning a good plan is to scatter grain plentifully in the litter after the birds have gone to roost. This grain will furnish feed for the early morning.

Some poultry keepers can look after their fowls only once a day. If this is in the morning, moistened mash may be fed, followed by throwing grain in the litter to furnish feed for the remainder of the day. If it is in the evening, before dark, a moistened mash may be given, and either after the fowls go to roost or in the morning, before daylight, grain may be scattered in the litter for eating during the day.

THE HANDY CALF PEN

One of the most convenient ways of handling calves is to run them in small pens with only a small number together. In one side of the pen provide a row of stanchions, one for each calf, and far enough apart to prevent their reaching and sucking each other's ears. A long, narrow manger, just enough to hold a pail, may be constructed in front of the stanchions. The manger is better to be made of cement or material that may be washed, or better still of galvanized steel, which is the most sanitary material procurable. If the calves are tied in the stanchions while they are being fed milk and then a little chop is thrown into the bottom of the pail or manger when they are done with the milk, they will eat the chop instead of sucking each other's ears. Where stanchions cannot be had and there are only two or three calves, they may be tied to keep them from sucking each other.

DISINFECTANT—BARRENNESS

Would like your advice on the following questions: What is the best disinfectant to be used for irrigating herd sire before and after service; also the best instrument to be used? What is the bst treatment for barren cows?—W. F. W.

It is common to use a one per cent. solution of coal tar disinfectant, or similar solution of hypochlorite of soda, or a quarter per cent. solution for the cleansing and disinfecting of the sheath and penis of the bull. A fountain syringe and a hard rubber nozzle serve for the purpose.

There is no certain remedy for barrenness as the causes are many and different, but it always is well to haxe a trained veterinarian massage the ovaries, by way of the rectum, two or three times at intervals of a week and he should also open the mouth to the womb if abnormally closed, or treat the womb if pus or mummified fetus is present.

DEPRAVED APPETITE

I have sixteen head of cattle and the most of them chew sticks and bones or any kind of rubbish and there seems to be something they want they are not getting. They have had all the salt they want and have ben out on good pasture. They have clover pasture and will go right out of the clover and look around for something else and the losing flesh. They have ben grained with barley and oats.—R. W.

Feed oats and wheat bran and twice daily add one ounce of bicarbonate of soda. The cows crave some ingredient lacking in this feed. The above treatment often proves remedial. If it does not in these cases, mix bonemeal or precipitated phosphate of lime in the feed, starting with two teaspoonfuls daily twice and increasing the amount if found necessary.

FREE SAMPLE
of Hallam's Paste Animal Bait

Enough for 2 or 3 sets—attracts all flesh eating animals—is put up in tubes (like tooth paste)—not affected by rain or snow. Economical to use, handy to carry.

Also Hallam's Trappers and Sportsmens Supply Catalog—48 pages, English and French—showing Animal Traps, Guns, Ammunition, Fish Nets, etc. All at moderate prices.

Holstein Herd Averages 18812 lbs. Milk

A herd of 13 purebred Holsteins last year averaged 18812 lbs. milk and 638.57 lbs. fat.

Do you realize the money there is in such cows? It is estimated that the average annual yield of all cows in this country is under 4,000 lbs. These 13 cows produce as much milk as 62 cows of the 4,000-lb. class.

Why feed, milk and shelter any more cows than you need to produce the milk you require? If interested in HOLSTEIN CATTLE send for booklets—they contain much valuable information.

In and About Your House

AND BARNS WITH *Northern Electric* POWER and LIGHT

NORTHERN Electric Power and Light means *Power* to do most of the chores in half the time, doing away with a lot of hard work.

It means *Light*—a good supply of happy, clear, safe, glowing electric light—better than you ever had the old way.

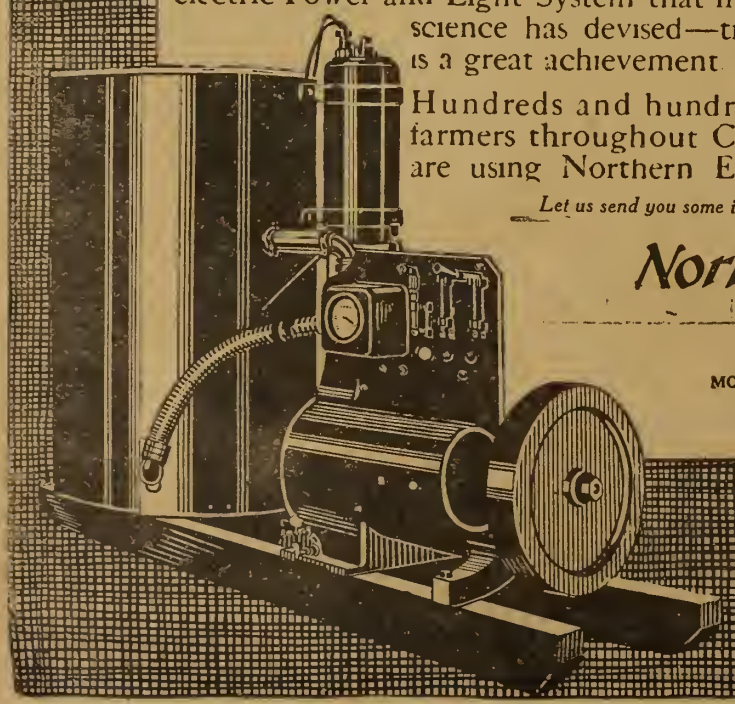
Never in the history of isolated electric generating systems was there an ideal so reliable, so successful as *Northern Electric Power and Light* It has all the finishing touches to make it the most complete, efficient, reliable, economical electric Power and Light System that modern science has devised—truly it is a great achievement

Hundreds and hundreds of farmers throughout Canada are using Northern Electric Power and Light with intense satisfaction, and you, too, can very easily become one of them.

Electricity will turn the grindstone, cream separator, grain grinder, churn and a host of other chores about the farm. It will clean the house, wash and iron clothes, wash the dishes, cool the home, and do a score of other household tasks all at a surprisingly low cost.

Northern Electric Power and Light is automatically controlled—simple and easy to look after. Back of it is more than twenty-five years of electrical experience, a Dominion-wide distributing organization with complete stocks in nine of Canada's largest cities.

When you buy Northern Electric Power and Light you get a system which enjoys an international reputation—a means of easily procuring almost every kind of electrical appliance built especially for this service, such as Northern Electric lamps, wire, motors, pumps, irons, sewing-machine, vacuum cleaner, etc. See that your whole electric outfit is Northern Electric.



Let us send you some interesting illustrated leaflets to-day. Fill in and return attached coupon.

Three Rivers, Quebec

A Wonderful Family Gift—Overland 4 With Three Point Suspension Spring

GIVE your family a Christmas gift of "smooth roads"this year. Give them the new Overland 4 with Three-Point Suspension Springs, the greatest riding improvement since pneumatic tires.

The Three-Point Springs disipate jolts and reduce sway and vibration to a minimum.

They make riding on any road smoother and more enjoyable.

With these springs Overland 4 seems to sail over bumps, cushioned from the shocks of the worst roads, with a road steadiness never before approached by a light weight car.

The Three-Point Springs attached diagonally at the ends of a 130-inch Springbase give long wheelbase steadiness and comfort with 100-inch wheelbase lightness, economy and driving ease.

By protecting the car from road blows they prevent excessive wear, give every part longer life and make Overland 4 very economical in upkeep.

A still further source of economy in Overland 4 is its light weight which saves in the consumption of oil and fuel.

With all these important features, Overland 4 is in addition a car of marked beauty and smartness in design. Its equipment is complete from Auto-Lite Starting and Lighting System to Rain-Vision Windshield.

Ask the Overland dealer to show you this unusual car. Try its remarkable riding ease. It sets a new standard of comfort. Booklet on request.

W. W. Ballantyne writes an advertisement

Neidpath Farm
Near Stratford, Ont.

Dear Sir:—

The Delco-Light Plant you sold me to light my farm has not only given us the pleasure and convenience of electric light in all our buildings, *but is rapidly paying for itself in the work it does.*

It would be a good investment for us aside from the lighting altogether. So far, we have found 16 jobs for Delco on our farm and we are constantly finding new jobs for it. We are using power from Delco-Light to run:—

(1) 3-unit milking machine.
(2) Cream separator.
(3) The pump in the dairy.
(4) Root pulper.
(5) Emery stone.
(6) Horse clippers.
(7) Sheep shearing machine.
(8) Fanning mill.
(9) Washing machine.
(10) Vacuum cleaner.
(11) Electric iron.
(12) Toaster.
(13) Charging batteries on our motor car.
(14) Pumping water for household use.
(15) Lighting our home, stable, outbuildings and yard.
(16) Violet ray generator.

We have never figured this work down to so many hours per day, but we do know that we can operate the farm with one less man than we used to. Figure out the wages and board of a farm hand and you can see what the Delco-Light plant saves us.

We used to run a gas engine on the milker and cream separator, at a cost of 10 cents a day. Our Delco-Light plant supplying light and power for the whole farm costs only 7 cents a day.

It would not only be a harder proposition to run our farm without Delco-Light, but it would cost us a lot more money. We have no hesitation in recommending any farmer to harness up his farm to Delco-Light.

Yours truly,

(Signed) W W Ballantyne

The man who considers Delco-Light something that he will buy —*when he can afford it*—should heed this strong letter from Mr. Ballantyne. It costs more money to farm *without* Delco-Light. Can you afford, then, to delay equipping your farm with light and power?

Exclusive Delco-Light Features

Where there is a boy on the farm, he can look after this simple plant. These features insure care-free, long-lasting service for you.

It is direct-connected. There are no belts to slip, break or be replaced.

It is self-cranking. Pressing down on a lever starts the engine and it stops automatically when the batteries are charged.

It is air-cooled. There is no water to carry, to freeze or to boil away.

There is only one place to put oil. There are no grease cups.

A simple mixing valve regulates the fuel supply. There is no complicated carburetor.

Ball and roller bearings cut down friction and increase efficiency.

Thick-plate batteries are long lasting.

75,000 Delco-Light plants are operating in Canada and the United States. This in itself proves the practical nature of the plant. Let us put you in touch with some of these people.

You owe it to yourself and your family to learn what Delco-Light will do for you. As a start toward greater comfort and larger profit, ask us to send you the Book "Pays for Itself," written by practical farmers.

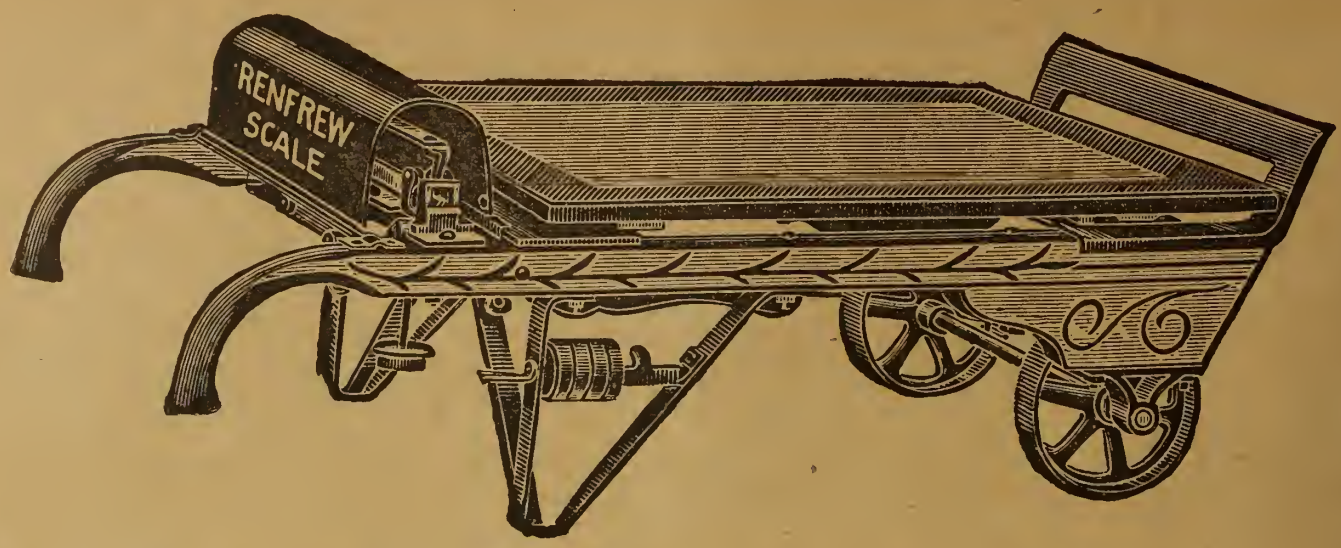
DELCO-LIGHT

The Complete Electric Light and Power Plant for Farms

The Domestic Engineering Co., Dayton, Ohio. *Makers of Delco-Light Products.*



A Real Money Saver

Farmers cannot afford now-a-days to drag along with old-fashioned methods. This handy truck scale will prove a wonder as a money-saver, and will make many short-cuts in your work. The

Renfrew
TRUCK SCALE

weighs anything from a pound to a ton. There is no need to lift heavy loads; simply truck the scale to whatever you want to weigh, slip it underneath, and the load is weighed. When it is not in use it can be stood up against the wall out of your way. Every part of the platform weighs accurately on even or uneven ground.

You need it for weighing cattle, horses, hogs, sheep, grain, feed, groceries, milk, etc. It is simple in construction and built for durability. Every scale carries a Government certificate of correct weight.

DAIRYMAN SHOULD RAISE HIS OWN COWS

Every dairyman must add new cows to his herd from time to time to replace those removed on account of old age, disability or death; and it would seem a wise policy to raise heifer calves for this purpose rather than to buy additional stock outside. If the dairyman has good producing foundation cows and a purebred sire backed by proven ancestry, he may feel very sure that his heifer calves, carefully reared, will make good at the pail; while his bull calves may easily be disposed of at profitable prices, if judicious advertising setting forth their rightful claims to transmitted and transmitting superiority is employed. On the other hand, the dairyman who is constantly buying to maintain the desired number in his herd is liable to bring in occasional undesirable individuals, of ill breeding, improperly reared, or carrying the germs of disease with which to taint and lower the general standard of his herd. We believe, also, that any man has more real affection and pride for animals of his own breeding than for others; that he understands them more perfectly and can produce better results with them. And so we say, for the joy that may lie in your work and the profit you hope to secure through it, lay a satisfactory breeding foundation and raise your own cows.

PIG THAT CRAWLS ON ITS KNEES

I have a pig five months old that has gone off its feet and has to crawl around on its knees. My pigs are fed on shorts and oats and are kept in the cow barn and never get out. What can I do for them?

Also let me know what is the cause of my hens laying shell-less eggs. I gave them gravel, oyster shell and lime.—S. M.

Reply: Let your pigs out in an open run with some shelter and feed them plenty of green or succulent feed such as roots or alfalfa hay and plenty clean water. Do not feed any shorts or oats till they get on their feet and then start gradually. Let them have coal ashes to root in and give them charcoal and salt in small quantities. Close confinement and high feeding is the cause of your pig trouble. Where high feeding is practised, it should always be accompanied with plenty of exercise.

Lime and oyster shell grit is the natural feed for laiyng hens so that they will have well shelled eggs. Be sure your hens are getting the grit and lime in a way they can eat it and wait for results. Sometimes when hens are getting are roughly treated or frightened by dogs, etc., they will lay shell-less eggs.

AN OINTMENT FOR VERMIN

Don't forget to dose the hens and chicks, after feathering, with an ointment made of equal parts of blue ointment and vaseline or lard, carefully mixed together. Rub this ointment thoroughly onto the skin under each wing and also a litle below the vent of each bird, using a portion of the ointment the size of a small grain of wheat for each one o fthe three places and half as much for a half-grown chick. Repeat once in two or three months. This is a sure remedy for all kinds of external poultry parasites except mites.

For mites, keep the roosts and nests painted once a month with coal oil, or better yet, crude petroleum. Also paint with the same preparation the coops where the young chicks sleep.

Some Lessons in Fertilizer Arithmetic

By E. G. Proulx, Indiana State Chemist

At this season of the year many of our Maritime Province farmers are seriously considering their problems of soil fertility for the season of 1920. The circulars issued by the various fertilizer manufacturers operating in this territory are being carefully perused by the more wide-awake and progressive agriculturists. The content of the various elements of plant food and their availability, as well as their relative values and costs from the respective sources must be duly considered, if the farmer is to get the best value not only for his money, but also for the time and labor he will expend on the growing crops next season.

Purdue University Agricultural Experiment Station, recently issued a leaflet compiled by E. G. Proulx, State Chemist, and while it is an open letter to the farmers of Indiana, our Maritime Province farmers can glean a lot of useful ideas from its contents, which are reproduced herewith.

"The proglem of soil fertility—its maintenance and increase—is carefully studied by every successful farmer. To the thousands who are finding profit in the use of plant food purchased in the form of some commercial fertilizer, the problem presents itself twice a year, in the spring and in the fall, with special demands for attention.

"Indiana farmers in 1918 purchased 244,446 tons of fertilizer having a retail value of $8,004,701.00. More than half of this tonnage was considered low, grade, containing relatively small amounts of plant food, nitrogen, water soluble potash and available phosphoric acid.

"Considering the retail prices on all brands of fertilizer sampled in the state in 1918, it is estimated that Indiana farmers could have obtained the same amount of plant food at a saving of $813,184.00, if all fertilizer purchased had been high-grade.

"Many inquiries are received from Indiana farmers concerning the cost of plant food in different fertilizer brands. It is practically impossible to fully and satisfactorily answer all these inquiries by individual letters, and the State Chemist hopes the following method of comparison will enable the Indiana farmers to approximate these relatives values satisfactorily.

"In purchasing fertilizer, the farmer simply buys so many pounds of plant food in the form of nitrogen, total or available phosphoric acid and water soluble potash. The problem is which fertilizer formula furnishes the desired plant food the cheapest. The prices under consideration are quoted Indiana agents for the 1919 fall trade in carload lots of 125-pound burlap bags and in considering these prices, consumers should allow a legitimate profit to the agent to cover the cost of handling, storage, etc. It is unfortunate that manufacturers quote ammonia (NH^3) and not the element, nitrogen (N), as the Indiana fertilizer law requires manufacturers to guarantee a minimum percentage of nitrogen on the official label.

Cost of Plant Food in Low, Medium and High-Grade Fertilizer Brands in Carload Lots

2	10	4	high	44.50	1.80	0.09	1.67	0.08	6.05	0.30

"It is necessary only to remember that 1.0 per cent. ammonia (NH^3) is equivalent to 0.82 per cent. nitrogen (N); 2.0 per cent. ammonia (NH^3)= 1.6 per cent nitrogen (N), etc. Since manufacturers invariably quote ammonia (NH^3), the following discussion of prices is on that basis.

"Two other factors are necessary to properly understand the comparison of prices between brands. It is customary to speak of a unit of plant food, a unit of potash, etc. This means simply 20 pounds or 1.0 per cent. of a ton. A unit of plant food per ton thus means 20 pounds of plant food in each ton of fertilizer.

"A satisfactory division into high, medium and low-grade fertilizer is extremely difficult to make and in the table the division is made on the basis of the total content of available plant food. A high-grade fertilizer is one having a sum total of ammonia (NH^3), potash and available phosphoric acid, not less than 14 per cent.; a medium-grade fertilizer is one having a sum total of not less than 12 per cent. and a low-grade fertilizer is one having a sum total of less than 12 per cent. Acid phosphate containing 14 per cent. or more of available phosphoric acid is considered as high-grade. A "half and half" brand guaranteeing 10 per cent. available and 10 per cent. insoluble would be considered as low grade, as only available plant food is considered in this discussion.

"Since acid phosphate is used in all commercial fertilizers which guarantee available phosphoric acid, the cost per unit and pound of available phosphoric acid in 16 per cent. acid phosphate or 16 per cent available phosphoric acid is taken as representing the cost per unit and pound of available phosphoric acid in all mixed fertilizers. Manufacturers quote 16 per cent. acid phosphate at $26.75 per ton in carload lots; this cost would be $26.70 ÷ 16 = $1.67, the cost of one unit of available phosphoric acid; $1.67 ÷ 20 = $0.08, the cost of one pound available phosphoric acid. A few manufacturers, able to obtain high-grade phosphate rock, are offering 20 per cent. acid phosphate at $31.50 ton. The cost per unit of available phosphoric acid, in this case, would be $1.575. All manufacturers seem able to make acid phosphate containing 16 per cent. available phosphoric acid, but few manufacturers are able to make 20 per cent. available phosphoric; hence, 16 per cent. is used as the basis in the table.

"Considering the brand guaranteeing one-half per cent. ammonia and 12.0 per cent. available phosphoric acid as $26.75 per ton, it is fair to the manufacturer to assume that three-fourths of a ton of the 16 per cent. acid phosphate was mixed with one-fourth of a ton of material containing 2.0 per cent. ammonia. The cost of three-fourths of a ton of 16 per cent. available phosphoric acid is ¾ × $26.75 of $20.06. This amount subtracted from the cost of the brand, $26.75, leaves $6.69, as the cost of one-half a unit of ammonia. A unit of ammonia, therefore, in this particular brand would cost 2 × $6.69 or $13.38, while the cost per pound, $13.38 ÷ 20 = $6.67. It is much shorter to use the unit basis, in which case 12 per cent. available phosphoric acid × $1.67* = $20.04; $20.04 subtracted from $26.75, the cost of the fertilizer, = $6.71, the cost of one-half a unit of ammonia; 2 × $6.71 = $13.42, the cost of one unit of ammonia in this fertilizer.

"The same method is followed in brands guaranteeing available phosphoric acid and potash. For example—the brand in which there is guaranteed 10 per cent. available phosphoric acid and 4.0 per cent. potash at $34.50 per ton; 10 × $1.67 = $16.70 as the cost of 10 per cent. available phosphoric acid; $16.70 subtracted from $34.50, the original cost of the brand, gives $17.80 as the cost of four units of potash; $17.80 ÷ 4 = $4.45, the cost of one unit of potash; $4.45 ÷ 20 = $0.22, the cost of one pound of potash.

"Considering the complete fertilizer brands which guarantee ammonia, available phosphoric acid and potash, the cost of acid phosphate in complete fertilizer is again taken on the basis of 16 per cent. available phosphoric acid or $1.67 per unit. The average cost per unit of potash on brands guaranteeing available phosphoric acid and potash was found to be $6.05 per unit; therefore, $6.05 is taken as the average cost of potash per unit in complete fertilizer. Taking $1.67 as the cost of one unit of available phosphoric acid and $6.05 as the cost of one unit of potash in complete fertilizer does not give the correct cost of the ammonia. It does, however, conclusively show that plant food in high-grade complete fertilizer costs less than it does in low-grade. The cost of ammonia in the 2-12-2 at $40.00 per ton is 12 × $1.67 = $20.04, the cost of available phosphoric acid; 2 × $6.07 = $12.14, the cost of two units of potash. Available phosphoric acid and potash together cost $32.18, which subtracted from $40.00, the original cost of the brand, leaves $7.82 as the cost of two units of ammonia. One unit of ammonia, therefore, in this brand of fertilizer would cost $7.82 ÷ 2 or $3.91. This again divided by 20 would give the cost per pound of ammonia, 20 cents.

*The unit cost of $1.67 was taken in place of $1.6718+.

"Reliable fertilizer manufacturers retain their trade with their customers year after year, because they honestly sell fertilizer which gives satisfaction and shows increased crop production. On the other hand, a few manufacturers sell brands of fertilizer which guarantee very little plant food but which are widely advertised to benefit the soil and produec good crop returns through the action of some unknown factor not recognized by soils and crops experts. These latter manufacturers, apparently, spend nearly as much for advertising as it costs to manufacture their so-called fertilizers. Necessarily, they figure on obtaining new customers every year.

"The Indiana fertilizer law was pass-

(Continued on page 163)

First Annual Convention and Dairy

The first annual Convention and Dairy Show of The New Brunswick Dairymen United was held in the Agricultural School, Sussex, on December 3rd and 4th. F. G. Hughson, president of the Association, relayed by A. E. Trites, the Vice-President, presided at the various sessions. H. W. Coleman, the popular, energetic and efficient Dairy Superintendent and his assistants had worked hard to make the Convention and show a success.

The members of the New Brunswick Dairymen United include representatives of cheese factory patrons, creamery patrons, cheese makers, butter makers, private cheese factory owners, private creamery owners, joint stock cheese factories and joint stock creameries. Among the prominent dairy authorities present who assisted M. Coleman in putting the ture and sale of dairy products. There is no such a thing as stagnation in the dairy industry, it must proceed or recede. He was glad to note that the Association was moving along lines of progress. There was much room for a good deal of development in the dairy herds of the province. In conclusion he recommended a favorable consideration of the National Dairy Council's propaganda which would be outlined at a future session.

The Dairy Superintendent's Report

Mr. Coleman gave a very comprehensive report of the dairy situation in the province. He too welcomed the delegates and remarked that for a long time he had been looking forward to the first convention with rather mixed feelings. The convention was a venture and he was rather anxious to know how the parties in being made by the Farmers' Co-operative Creamery at Moncton and the Madawaska Creamery at St. Hilaire, the latter factory having increased its output at least 50 per cent.

Mr. Coleman had spent considerable time on instructional work during the year. He made 36 full day calls, which included the entire time from early morning when the milk was being received until the cheese was pressed and the daily routine work rounded out. He had also made 198 call visits lasting from a few min uutes to several hours, as occasion required. The following tests were also made:

375 Babcock tests, 215 Examinations for Adulteration, 193 Sediment tests, of which 52, 59 and 82 samples showed good, fair and bad conditions respectively. 54 Fermentation tests, some improvement in factory equipment during the past season but there is still room for more modern and sanitary conditions.

Mr. Coleman laid a great deal of stress on the absolute necessity for cleanliness in factory and surroudnings. Every factory should have a whey tank committee to see that the whey tank is kept empty and scrupuuously clean. An empty tank did not mean a clean tank. Too many of the cheese troubles have their origin in the foul smelling whey tank and here was one place where precautionary measures could be put into practice.

The surroudngs of many of the cheese factories were not attractive. The stranger driving along the road would scarcely judge from the appearance of factory and surroundings that it was the most important centre in

convention over the op were Hon. J. F. Tweeddale, Minister of Agriculture and his deputy, Mr. Bradt, J. A. Ruddick, Dairy Commissioner, Ottawa; Geo. H. Barr, Dairy Division, Ottawa; Prof. Trueman, of the Nova Scotia Agricultural College; D'Arcy Scott, Secretary Canadian National Dairy Council, Otawa; W. A. McKay, Dairy Superintendent for Nova Scotia; Harvey Mitchell, New Brunswick Representative for the Dairy Division, Ottawa; A. J. Gaudet, St. Joseph, and a representative aggregation of the cheese and butter makers, patrons and owners of cheese and butter factories.

President Hughson welcomed the delegates and made fitting reference to the aims and objects of the Association. Already noticeable improvements had been made in the manufac terested would respond. He felt that if the members who would attend the various sessions would only carry home the spirit of enthusiasm that is frequently found at dairy conventions a great deal of good would result.

He submited the following figures on the butter and cheese production in New Brunswick:

	1918	1919
Production		
Cheese	1,174,000 lbs.	1,324,,000 lbs.
Value	$264,304.00	$370,000.00
Av. price	22.43 cents	28 cents
Production		
Butter	666,000 lbs.	900,000 lbs.
Av.price	45 cents	55 cents
Value	$297,000.00	$495,000.00

The outstanding feature of the dairy industry during the past season was the rapid strides that are showing conditions good, 19; fair 25; bad 10.

Improvement in Quality

Considerable improvement was noticeable in the quality of the products during 1919. In 1918 nine per cent, of New Brunswick cheese graded seconds, while the 1919 output had only six per cent of second grade goods. The grading of cheese as at present carried on is steadily raising the standard. "Cull cheese," he said, "was an insult to the cow." He introduced the question of making a special grade of cheese in 1920 and left the matter in the hands of the makers for future consideration. There was a vast difference between a real first class quality cheese and one that would hardly escape going into a second grade class. There had been the community. A great deal of improvement in the way of tidying up and brightening up is needed at some factories and some at every factory. This kind of work should be accomplished by the board of directors of each and every factory of their own free will without waiting to be coered into doing so by the legislature.

The Cheese Board

The Cheese Board established at Sussex on the 12th of last June had held ten meetings and a total of 8,500 boxes had been boarded. The Board had made money directly for the cheese men who ptaronized it and indirectly for others who had benefited by the prices received because the board was in existence. Cases had come to the speaker's notice where some dealers had offered fac-

Show of the N. B. Dairymen United

tory salesmen a fraction of a cent more a pound for their cheese in order to spread dissatisfaction among the Cheese Board patrons.

In conclusion Mr. Coleman thanked the Cheese factory and creamery offiials for their co-operation during the year in the movement for better raw material, better equipment and a higher standard of equality in the manufactured produuct.

J. A. Ruddick, Dairy Commissioner, led the discussion on Mr. Coleman's report. He congratulated the men present on their organization, Mr. Hughson for being the first president the Association and the province of New Brunswick on having secured the serivces of Mr. Coleman, who was formerly a member of his own staff and whose energy and efficiency he had long since recognized. Referring being due to the incorporation of too much moisture—water at 28 cents a pound gives the manufactlurer a good return but it cheats the consumer and on the whole is a dangerous practice. Cheese curd should be stirred until quite dry in ored r to give the manufactured cheese the proper body, but not so dry as to produce a corky cheese. All flavors found in cheese were not controllable in the factory, some have their origin in the barn. Dirt is responsible for a lot of the cheese makers' troubles. Some producer s are careful, others are the reverse. If all hands would care for the raw material as well as do the more careful ones there would be a rapid advancement made in the quality of the cheese placed on the market. No place in Canada offers more opportunities for advancement than does maker he would not think of making cheese without keeping records of every day and every vat. The 215 temperature tests he had made during the year showed an alarming percentage of failure to properly cool the milk. More attention should be paid by the maker to the raw material as it is received at the whey tank door and more visitation of the farms from which the supply is received.

Among others who took part in the discussion were A. E. Trites, who made reference to the progress made by the Moncton Creamery; C. F. Alward, who welcomed the institution of the Cheese Board as a long felt need in this province and W. A. MacKay, Dairy Superintendent for Nova Scotia, who emphasized the necessity for tidy factory surroundings and made reference to the dignity of the

to New Brunswick cheese, Mr. Ruddick said it had a characteristic quality in its texture that was not often found in cheese manufactured in the other provinces. This pleasing characteristic should be of specific value to the industry here.

Mr. Barr said he had told the New Brunswick cheese men when he had first met with them that there was room for improvement in the quality of their goods. Having judged the cheese exhibit at the show he was in a position to note the improvement that had been accomplished during the year. He had, however, found some flavors in a number of the entries that should be foreign to a dairy product. Among the criticisms he had to make was the prevalence of a hop flavor, weakness in texture, the latter New Brunswick. Two years had brought about a vast change for the better and New Brunswick should never rest until the quality of her products is not onl yas good but a little getter than that made in the other provinces.

Patrons should not strive to see how many pounds of cheese could be made from 100 pounds of milk. Rather get the quality and the quantity will come later.

He said it was impossible to make a good grade of cheese unless the milk was cooled to 65 degrees on the farms as soon as it came from the cow.

If there is a market for a special grade of cheese it will pay to cater to that market.

Mr. Coleman said that as a cheese cheese and butter maker's profession and the necessity for a Maritime Dairy School.

Mr. Alward asserted that he believed the average cow in the herds of New Brunswick dairymen was producing as much as three of the average cows when cheese factories were first organized in the province.

Feeding the Dairy Cow

Prof. Trueman gave a practical talk on the feeding of the dairy cow. He emphasized the necessity for every feeder to familiarize himself with the terms used in compiling rations as well as the food value of the various grades of feed found on the market. He also emphasized the necessity for feeding sufficient rations for maintainence as well as for keeping the machine at its full productive capacity.

The silo and O. P. V. silage had come to stay and was becoming more popular every year. Prof. Trueman, as usual, gave his hearers a lot of practical ideas. Ideas that are workable under New Brunswick conditions, and it is regrettable that the hall was not filled to overflowing by milk producers, who could not help gleaning valuable information from him.

The Wednesday evening programme was interspersed with several musical selections by the Misses Gertrude Sherwood, Jean Elder Allison and Gretchen Mills and Messrs. James Cameron and A. C. Gorham.

J. A. Ruddick, Dairy Commissioner, read a paper dealing with the inception and progress of the dairy business in New Brunswick and the salient features of the worlds' dairy markets, which will be published in full at a later date in these columns. He also took his audience on a tour to view the dairy industry at home and abroad, by the means of lantern pictures.

Dr. Cumming, of the Nova Scotia Department of Agriculture, who was to address the meeting on "Rural Problems of the Day", was unavoidably absent, and Prof. Trueman substituted for him. Prof. Trueman gave an interesting address. He strongly urged more attention to better breeding of dairy stock, better feeding and more careful selection. The rural school was the only factor that would solve the problem of indifference that is so hard to overcome among grown up people. Our future prosperity depends almost entirely on the training our young boys and girls receive in our rural schools.

Teaching should be made more attractive financially, so that instead of it being used as a stepping stone to some other profession, those who engage in it would be influenced to put into teaching the best that is in them. The school should be the community centre as well as the church. There are altogether too many churches. One efficient church in a community is sufficient.

Hon. J. F. Tweeddale, Minister for Agriculture, was the last speaker for the evening. He referred briefly to the conditions he had found existing in the cheese and butter industry of the province when he assumed the administration of his department. New Brunswick cheese did not have an enviable reputation. Some of the cheese shipped was a disgrace and a detriment to the dairy industry of the Province. He soon recognized that here was a condition that must be rectified. New Brunswick cheese must be brought up to a standard that would bring repeat orders, instead of being a by-word of disrepute among the dealers.

Assisted by Mr. Harvey Mitchell, of whom he spoke in glowing terms of appreciation for efficient service to the province and the Dominion, he arranged for a series of conferences with the officials of the various cheese factories in the province, and the poor quality of some cheese that had been shipped out of the province and returned as unfit for human consumption, was forceably brought to their attention by exhibiting to them the loathsome condition of the cheese in question. The late C. W. McDougall and Mr. Mitchell had worked hard during the season 1917 for improved conditions, and he was pleased to hear from the dealers who handled New Brunswick cheese in 1918 and 1919, that a decided improvement had been effected, and confidence in the quality of New Brunswick cheese again established with the dealers and consumers.

The Minister also referred to the splendid response made by the farmers of the province when occasion demanded that they bread themselves, so that their usual supply could be diverted to help feed the other nations of the allied cause. There had been increase of nearly half a million dollars in the value of dairy products manufactured in the province during the years 1918 and 1919 over the production of 1917, which was a clear indication that the industry is advancing in point of quantity as well as in quality, as heretofore outlined.

In conclusion Mr. Tweeddale expressed the opinion that the only cure for the unrest so prevalent among all classes is work. Every man should and must work. A reasonable number of hours, with as much efficiency as he can crowd into his work in order that both food and goods may be produced at a figure that does not make their use prohibitive.

DECEMBER 9, 1919.

IN DOING CHORES HAVE A SYSTEM

Efficient management in farm operations often mean the difference between success and failure. There was a time in the history of this country when it was not absolutely necessary to pay as strict attention to the efficiency factor as it is today, but that time has passed with the pioneers and the farmers of the present day must employ more efficient and up to date methods if they are going to succeed. Operating costs have advanced one hundred per cent. or better, and labor has become scarce and expensive, especially during the last ten years. All these factors have worked towards ever decreasing profits, and the only alternative for the farmer is a curtailment of the cost of production.

In many respects there is probaably no department on the farm where efficient management can economize on labor as much as in the matter of doing the daily chores. By that is not meant a complete rearrangement of the stables but rather a reorganization and planning of the work that must be done day after day as long as the cattle are in the stable. Perhaps the tying arrangement may be unhandy and a few slight changes would make the work a great deal easier. Fitting cows to the stall is another method by which a great deal of the labor of keeping them clean can be eliminated. If the stall is too long and it is not easy to change the cow to a stall that fits, a board nailed in a slanting position against the manger will line her up to the gutter. Then again it may be possible to fix up boxstalls and allow the calves and younger heifers and colts to run loose throughout the winter. They will be the better for the exercise and a great deal of time can be saved in caring for them. The matter of feeding the cattle at noon is also another open question, but it has been pretty well settled by all leading stockmen. It has been proven beyond all doubt that it is not necessary to feed three times per day in order to obtain maximum results, provided of course, that they are given enough at the morning and evening meals. Such a method is undoubtedly a great labor saver as it leaves the attendant free to do other jobs during the middle of the day.

The above are but a few suggestions whereby it is possible to economize on the time and labor of doing chores. Of course there are many more, such as loading the manure directly onto the sleigh and drawing it to the field, watering the stock inside, milking by machinery, the use of litter carriers, etc., all of which have a bearing upon the result and cost of farm operations, to say nothing about the increased number of animals it is possible for one man to care for in the same length of time. This can best be understood by visiting the home of one of our prominent stockbreeders where the animals are cared for in the most approved manner. Here may be seen one man looking after several head without any great difficulty, and at the same time doing the work well. These men have made a study of the business, have built their barns accordingly, and it is surprising how much time can be saved in a day simply by eliminating a few extra steps for some article required several times each day. Having the meal bins close at hand and the use of a carrier or truck for feeding ensilage and roots are excellent examples of this. They often mean the difference of an extra man. Efficiency is at the bottom of the whole thing and there is no better way of studying it than by paying a visit to some well arranged barn where large numbers of animals are stabled and cared for properly. Such a trip is well worth the time and expense of any farmer.

GIVE PROPER ATTENTION

One factor which every dairyman can control as a means to greater production, although not so often considered, is the quiet handling of his cows. Anything which is inclined to create excitement is quite likely to have a tendency to decrease the milk flow. The necessary requirements for maximum production are contentment and kindness. The former is supplied when we furnish the cow a sufficient amount of the proper food to eat, an abundance of clean, fresh water to drink, and a warm, dry and well-bedded barn to live in. When a cow has been contented it is absolutely necessary that if we are to maintain the production that has been secured, some attention must be given to the treatment of the cow. Some men make a practice of continually having a dog with them when they are around the cows. As most cows hate dogs, this is a very poor practice, because the dogs usually greatly excite the cows and as a result they will not give down their milk. A noisy herdsman is likewise annoying, one who is continually yelling at the cows, running them in and out of the barn wtih the aid of a pitchfork, and knocking them from one side of the stall to the other by brute force alone, and can never obtain maximum production. It is a well-known fact that when a cow takes a dislike to a man she is spoiled as far as that particular man is concerned, and she will show her dislike by kicking him out of the stall or else she will refuse to give down her milk, and if the same milker continues on the job, in a very short time the cow will dry herself up to such an extent as to be unprofitable. Whenever a cow must be tied before she can be milked, just that soon we may feel assured that the cow will not do herself justice as far as a record is concerned, and every time the milker looses his temper with a cow, the same is done at a loss to the owner.

FOOD NEEDS OF ANIMALS

The primary functions of food are to repair the waste of the body, to promote growth in immature animals, and to furnish heat and energy. And for these purposes only the digestible portion of the food is to be taken into account. The amount of digestible protein, fat, and carbohydrates in a ration is an indication of its fitness to fulfill these purposes. The next question is, How much of these materials does an animal require, and in what proportion should they be given? This differs with the purpose for which the animal is kept, whether it is growing, being fattened, used for work, or making milk. An animal standing in the stall requires less food nutrients than one which is worked hard every day. That is, in drawing heavy loads the animal breaks down or consumes a certain amount of muscular tissue, which must be replaced by protein in the food, and it uses energy or force which is also furnished by the food nutrients. In standing in the barn it still requires some protein, fat, and carbohydrates to perform the necessary functions of the body to maintain heat in winter, to grow a new coat of hair, etc. But if it is fed the same ration as when working hard, the tendency is to get fat or waste the food.

UNWEPT—UNHONORED—UNSUNG

Toronto Fair visitors whose fancies took them over toward the stock judging ring probably stumbled across a newly-made grave, to all appearances well tended and cared for. A trim fence kept off the intruder, and at one end of the trimly faashioned mound stood a perfectly correct appearing headstone, bearing an inscription after this fashion:

"Here lies the remains of the Scrub Bull.

"Now we have a chance to put the right sort of livestock on the farms of Ontario."

"Too bad, is it not, that this menace to agriculture cannot be eliminated in some such simple way as this? The day when the scrub bull can be safely called a thing of the past is many a moon distant yet, but the stronger the agitation, the stiffer the fight, the sooner will the deed be accomplished.

GETTING THE IDEA

Before putting up a new building or making other improvements that are to be permanent it is a good plan to give some thought to the matter and be sure that they are what they should be to give the greatest service. If the neighbors have buildings somewhat similar to what is needed go see them and ask questions. Get as many ideas as possible. This may save you from making mistakes. When you build, try to build right and no one can build right without taking some time for planning.

PEDIGREED SCRUBS

An animal may have a pedigree as long as your arm and still not be very much of an animal. There are pedigreed scrubs just the same as there are plain everyday scrubs. The pedigree is worth little without individual merit and performance. A cow that has the best pedigree known would be of ltle value as a dairy animal if she did not possess milk-producing characteristics and produce enough milk to more than pay for her feed and care. The farmer when he goes to buy an animal, no matter what kind, should not depend entirely upon the pedigree, but should look more to the performance. Pedigree alone will not suffice for there are many pedigreed scrubs in this country. Watch out for them.

* * *

The man who goes ahead and tries to do his lebel best has little time left to criticize the failures of others.

SOME LESSONS IN FERTILIZER ARITHMETIC

(Continued from page 159)

ed to protect the purchaser and the honest manufacturer. This law compels all manufacturers to properly register and tag their fertilizer before same can be sold in the state. Misrepresentation will be nearly, if not entirely, eliminated if fertilizer is purchased on the basis of the plant food guaranteed on the official State Chemist's label and not on the basis of advertising literature and the statements of some agents. Purchasers should insist on being shown the official label when contracting for fertilizer. This label is really the certified guarantee of the manufacturer and should truthfully represent the fertilizer in the bag to which it is attached. On the official label is stated the number of pounds of plant food in 100 pounds of the fertilizer in the bag.

Special Mixtures

"Half and half" brands guaranteeing 10 per cent. available phosphoric acid and 10 per cent. insoluble phosphoric acid are quoted to agents at $25.75 per ton. In general, these mixtures are composed of approximately equal parts of acid phosphate and raw rock phosphate. The available phosphoric acid would cost 10 × $1.67 = $16.70. This, subtracted from $25.75, the cost of the mixture, gives $9.05 as the cost of 10 per cent. insoluble phosphoric acid; 1.0 per cent. or unit of insoluble phosphoric acid, which in this case is derived from raw rock phosphate, would, therefore cost $9.05 ÷ 10 or 91 cents. Ground phosphate rock containing 28 per cent. total phosphoric acid is quoted around $12.00 per ton in carload lots in bulk at purchaser's railroad station. The cost of one unit of phosphoric acid in raw phosphate rock is $12.00 ÷ 28 = 43 cents. Why pay 91 cents per unit for insoluble phosphoric acid in "half and half" brands when it can be bought by the carload for 43 cents per unit in raw rock phosphate? Considerable misrepresentation occurs concerning the availability of phosphoric acid in these "half and half" brands. While some "half and half" mixtures invariably are composed of acid phosphate and bone, the big majority of them are composed of acid phosphate and phosphate rock. Purchasers are often led to believe that the insoluble phosphoric acid in a given fertilizer is derived from bone, when, as a matter of fact, it is often derived from rock phosphate. If the manufacturer wishes to sell a brand composed of equal parts of acid phosphate and bone, he should register as "half bone and half acid phosphate." This registration will then be stated on the official label and will fully protect the purchaser. The manufacturer of this brand of fertilizer will thus escape unfair competition with the manufacturer who otherwise might be selling a mixture of half acid phosphate and half raw rock under the same name.

"Brands composed of approximately equal parts of peat and limestone, guaranteeing 1.0 per cent. ammonia and selling for $20.00 per ton, are also for sale. On the basis of actual plant food furnished, the ammonia in this brand would cost $20.00 per unit. This brand, also, contains about half its weight of limestone. It is necessary only to say that limestone can be purchased for about $3.00 per ton. The value of the limestone in the brand, "peat and limestone," is, therefore, about $1.50. Giving the manufacturer credit for the limestone furnished, the cost of one unit of ammonia guaranteed will then become $18.50.

"LIME FERTILE."—This brand guarantees 3.0 per cent. total phosphoric acid. The mixture is composed of raw phosphate rock and ground limestone. The manufacturer of "Lime Fertile" also advertises that "'Lime Fertile' is inoculated with all crop nitrogen-fixing bacteria." The price to agents on this brand is not known, but the retail price, in one instance investigated, was found to be $40.00 per ton. At the present pirce of raw phosphate rock and ground limestone, this mixture can be duplicated for $4.00 per ton without the cost of bags and mixing. Concerning the "all crop nitrogen-fixing bacteria," samples of this brand were tested in Michigan and found to contain fewer organisms of nitrogen-fixing type than do poor, sandy soils.

"Fertilizing with gacteria is very much in the experimental stage and some investigators are now trying the propagation of bacteria in peat. Farmers who derive their living from the soil cannot afford to experiment with bacteria in fertilizer and should let their State Experiment Station test new theories of fertilization.

Summary

"High-grade fertilizer furnishes plant food (nitrogen, available phosphoric acid and potash) at a much less cost per unit or pound than do the medium and low-grade brands.

"The same amount of plant food is also obtained in much less bulk.

"Limestone and ground phosphate rock have no place in mixed fertilizers. These materials can both be secured unmixed at a cost considerably lower than when mixed in commercial fertilizers.

"From the table, it would appear that manufacturers are deliberately charging double for plant food in low-grade brands. As a matter of fact, the manufacturers have a fixed cost close to $10.00 per ton which must be applied to each ton of fertilizer. This cost covers overhead charges, freight, selling, bagging, office force, interest on investment, handling, etc., and is equally divided between a ton of low-grade or a ton of high-grade. This cost of about $10.00 per ton is proportioned on the basis of plant food contained in a ton of fertilizer. It is evident that a brand having 10 units of plant food would, by this system, have an additional charge of $1.00 per unit, while brands having 16 units of plant food would have an additional charge of 63 cents per unit.

"Most manufacturers apparently agree that "High analysis fertilizer saves three-eighths or more, of the freight cost—freight on five tons or less, instead of on eight tons.

"High analysis fertilizer saves three-eighths or more of the hauling costs—five trips to the warehouse instead of eight or more.

"High analysis fertilizer saves three-eighths or more of the bag costs—five bags instead of eight.

"Finally, high analysis fertilizer saves at least three-eighths of storage costs.'"

The individual saving in buying high-grade fertilizer may not appear sufficiently large, but the combined saving in Indiana in a single year would be close to $1,000,000.00.

"High-grade fertilizer contains little, if any, make weight or low-grade fertilizer material and must be composed of the most valuable plant food which can be obtained.

"By consulting with your agent, you will find he quote you high-grade or low-grade brands of fertilizer. It should not be difficult to make your choice."

ARE YOU ADVANCING OR RECEDING IN YOUR BREEDING OPERATIONS

The breeding, selecting and raising of the different breeds of farm animals has developed remarkably during the past half century. Never in the world's history has domesticated animals been brought to such a state of perfection as at the present time, and all mankind, including the tillers of the soil owe a deep debt of gratitude to those progressive men of vision who by careful selecting and skillful mating with a definite idea of improvement in view, have given to the world such perfect specimens of their kind as the best present day farm animals have proven to be. No less wonderful has been the evolution brought about in the improvement in roots grains and fruits, and it is impossible to estimate the value of the work carried on by some of the men who have made a life study of this, and few of us who now benefit as a result of their labors realize what we owe to these industrious men.

In the evolution of animal and plant life there is no standing still, no resting stage, we must advance or recede, if we do not continue to select and improve we at once loose ground as it is natural for any plant or creature if left unguided to revert to the lower kind from which it came. In the breeding of animal life, several laws of reproduction known as the laws of hereditary or back breeding, largely influenced the off spring and law variation, which produces exceptional specimens, in some instances greatly superior to any of their ancestors, and others to an equal extent their inferior. This law of variation if recognized and used by the intelligent breeder may be the means of the most rapid improvement of his particular breed of animals, as such exceptional individuals are generally just as prepotent and impressive breeders as any of their kind. Full brothers of some of the most noted sires in the world have proven disappointing breeders. Every observing animal fancier can call to mind many instances of this, and it is only after years of close observation, coupled with an aptitude for this class of work, that any man becomes expert enough to recognize in a sire the class of animal that will produce the sort of females he is attempting to breed. This is where the real expert judge is shown; almost anyone at all acquainted with farm stock can pick out a good dairy cow, especially when newly freshened. We have here a maximum development, the finished product as it were, but it requires more skill to select a yearling heifer that at maturity will duplicate our model cow and still greater to pick the sire that will perpetuate this kind. The skilled breeder, having always in mind a model of the type he is trying to perfect, is quick to detect any weakness in his breeding animals, and in mating any such aims to strengthen this defect in the offspring, and we find such men continually grading up. These are the men who have developed such splendid specimens of beef cattle that lay on the greatest amount of flesh where the cuts are most valuable, the bacon hog that also produces meat of the best quality and with the greatest profit to the producer. The breeds of sheep whose meat and wool varies to such an extent that a pound of the latter in the best breeds is worth nearly double that of some of the mongrel sorts. We are still aware of the improvement brought about in the noble horse, both in the lighter breeds for speed and in the massive draft animal, but great as has been the improvement and development of other farm animals none of them equal that brought about by the breeders of dairy cows. This animal by nature intended to produce enough milk to develop one calf, has through centuries of selection and breeding been brought to such a state of development that many such now produce enough milk on natural grass conditions to grow from two to six or more calves under especially favorable conditions, the modern dairy cow has frequently produced her own weight in milk every two weeks. One such cow has given one thousand pounds of milk in seven days, another one hundred and sixty-one pounds in one day; several have given thirty thousand pounds of milk in one year and from one thousand to fifteen hundred pounds of butter in the same period of time. Colony Farm, B. C., credits a cow with an average production of 98.98 lbs. milk per day for over nine months, all these are authentic official records made under careful government supervision by men under oath, by dairy cows whose ancestors have been carefully selected and mated. They are not freaks, and while the records quoted may be exceptional, they are generally more so for the reason that these animals happen to fall into the hands of skillful feeders and owners who have the special facilities for attending them. Then for the fact that they were outstanding superior individuals of their breed, as we witnessed the world's weekly butter record, 52 lbs. in seven days, broken recently by a cow owned by a young and quite ordinary farmer in Ontario, and we have in this province at the present time a heifer freshened at 25 months (being herself the daughter of a two-year dam), now under official test in R. O. P. that has given up to 60 lbs. of milk per day, testing over 4% fat, a world's record of a few years ago, and a splendid one for the present age and considering the ancestors for four generations were bred in this and other maritime provinces, an evidence that in our dairy cow as well as other domestic animals, we are improving steadily. It is hard to set the limit of production possible of attainment.

Recognizing, as every intelligent man must, the value of such animals over those of mongrel breeding, and the comparative cheapness with which they may be secured through the use of sires of the improved breeds, the marvel is why does not every farmer endeavor to get the use of one such. If the offspring of a special beef sire will grow to maturity on the same cost of feed and produce a carcass that is much more valuable to the consumer, it would be good business for any producer to use the best possible individuals of such breed even if he had to stand the cost alone, but as it happens through the percentage of male being equal the number of females, and the necessity of a breeder securing market for these, a good utility animal of any of the improved breeds may be purchased at breeding age at a price no greater than he will bring for the block at maturity, and the cost of his keep and the interest on investment will be the only charges against his services. Assistance is given by both local and federal governments in the purchase or loan of such animals, and every inducements held out to enable all our farmers to secure the use of improved sires. But in spite of these facts of the proven superiority of every sort of improved animal or fowl over that of their mongrel brothers, statistics show that less than 5% of our farm animals are of pure breeding, and only a comparative small percentage are grades of the different breeds or animals by pure sires and mongrel dams. What our province is yearly loosing through the continued use of mongrel sires must be a sum many times greater than our entire revenue, and we have in this alone a broad field ready for our best efforts in agricultural improvement.

WALTER M. LEA.

COW HAS A COUGH

I have a cow that has had a cough since spring. A yellow thick matter is discharged from her mouth at each attack. She freshens in April, and is giving seven quarts of milk per day. Her eyes are dull.—F. K.

Answer: Your cow shows every sign of having tuberculosis. You should isolate her away from other cattle and have the barn, or place that she has occupied, thoroughly disinfected. Tuberculosis is very often hereditary, but it also very often follows severe or neglected colds, insufficient food, exposure to cold and wet. If you have no opportunity to get her tested for tuberculosis it might be advisable to treat her, but she should be kept away from others. To have any chance of success, the treatment should have begun in the earliest stages of the disease. Careful attention should be paid to her housing so that she will be kept comfortable.

Gleanings From the Nova Scotia Agricultural College

HARVEST STOCK-TAKING

Now that the fields are stripped of their fruits, and all crops have been gathered in, there should be a careful and systematic survey of the season's work. Some more or less new ventures have been made on every pro gressive farm. Have they paid? If not, why not? The great bulk of the work has been of the routine type. Have the best possible results been achieved with those standard crops and lines of stock raising which go on from generation to generation?

In every line of work, while we do not for a moment discount the new venture, the main advance will be made by improving our methods of doing habitual things. After all there is a good deal that is new even in the growing of crops which our grandfathers grew. Some of them are being attacked by new foes. Some are subject to the ravages of old enemies which our forbears took as a matter of course, or as a mild form of judgment. We can no longer be content to submit to these, if there is any way of overcoming them.

Science is continually pointing the way to new conquests, and while we are unwilling by nature to swallow everything that comes our way at a gulp, he is the wise man who makes the utmost use of her proven facts. Over and over again we see demonstrations of vast gains which can be made by the adoption of methods and practices developed by those whose business in life is to experiment and discover. Every one who is familiar with the habits of scientific men knows that their inclination is not to be hasty in announcing their discoveries, but, on the other hand, possibly even to err in the way of over caution. From the standpoint of one who is more or less an outsider, what we wish to say is this.—Announcements of measures to combat pests and to overcome losses through disease, &c., should be received with the utmost confidence, provided the reader is willing to follow directions. Results may not be perfect, but they will be worth a good honest trial. The same is true of announcements of improved methods and practices in growing crops, etc.

Look over last season's results. Secure all possible information. Then lay plans to make next season the best yet. Last, but not least, get your plans working early. Time has a habit of flying away before we get going.

SPRAYING OF POTATOES

Another measure of vital importance which must be urged upon our farmers is the spraying of the potato crop. Never was the necessity of this measure more apparent that this autumn. Reports received at the office of the N. S. Department of Agriculture go to show that rot has this season exacted the heaviest toll in the history of the Province. Farmers in parts of Cape Breton who usually have considerable quantities of potatoes to sell or feed, are actually compelled to buy at the high prices now prevailing. Whole fields have been completely lost through rot.

This is a form of loss which is no longer in any sense necessary. Particularly regrettable is it at a time when food products of every kind are scarce and high priced. There is a remedy. Rather there is a preventive measure which can be relied upon. The use of Bordeaux Mixture is beyond the experimental stage. It has been abundantly proven that a few thorough sprayings with this preparation will insure the potato crop against the form of rot which follows blight. This is the chief foe of the crop, often proving far more fatal than the "potato bug" even when he is left to his own devices. It is this form of rot which has resulted so disastrously in many districts this year.

It is significant that the losses this year were much more serious in eastern Nova Scotia than in the western Counties, where the practice of spray- is more general. To save labor and time, it is well to mix the Bordeaux Mixture with the beetle poison. Thus two birds are killed with one stone, or, to be more accurate, two bugs with one dose.

A good illustration, setting forth these well proven facts recently came to the notice of the Department. An elderly farmer from eastern Nova Scotia dropped into the office of the Secretry for Agriculture, and told his story. He had attended the Short Course last winter at the College, and had there heard so much about spraying potatoes with Bordeaux Mixture, that he decided to try it. So convinced was he of the truth of what he heard that he made his experiment quite extensive. This was fortunate for him . The whole field had been sprayed three times during the season, with the exception of two rows in the middle. The potatoes in these two rows were practically all rotten, while the remainder of the field was almost entirely free from rot.

This man also observed that the yield was much heavier in the sprayed than in the unsprayed rows. He is now selling potatoes to neighbors, who, if they had adopted his plan, would have had an ample supply.

This is but a typical experience. The deductions are obvious. Not only was this man well repaid for taking ten days off to attend the Short Course, but he has proven to his own satisfaction, and to all who care to know, that spraying potatoes is a paying proposition. The increase in the yield has also been amply demonstrated by the College authorities and others. The general estimate is that every additional day that the tops are kept green means an incrase of five bushels per acre in a reasonably good field.

The winter is the time to plan and prepare for next summer's undertakings, and it is not too early even now to begin. A letter to the Department of Agriculture will bring any farmer who desires it full information on spraying practice and spraying machinery.

THE CLUB ROOT PEST

From general reports of root crops throughout the country it is evident that considerable numbers of our farmers have had a great deal of club root in their turnip fields. In many cases the crop on this account has been a complete failure. It is not only the field crop grower who has suffered, for cauliflower, cabbage, early and late turnips, radish, Brussel sprouts and kale are all subject to the ravages of this foe.

There is, however, litle need for the farmer or gardener on a smaller scale to worry over club root, povided it is dealt with in a systematic way. The cure is two-fold, the application of lime and a proper rotation of crops.

In 1915 the N. S. Agricultural College, Horticultural Division, had on their hands a considerable piece of land which was very badly infested with club root on cabbage. In fact, the whole crop was a total failure, and all vestige of vegetation was then ploughed down.

A series of plots were laid out, and different quantities of lime were applied, both of the burnt, air slaked lime and crushed limestone. Two check plots in different parts of the field were left unlimed. In these plots cabbage and turnips have been grown anually for the last four seasons. This is not a proper rotation, but it was supposed that more might be learned in a shorter time by planting a cruciferous crop every year. The lime was applied the Fall before planting the crop, and none has been applied since.

Where the heaviest application of both burnt and crushed limestone have been made there has been a notable decrease in the number of plants afflicted with club root. This year has given us a stand of plants one hundred per cent. free from club root. The plots which received a much smaller quantity of lime are not absolutely free from the pest, but under the plan of the experiment they show a very decided improvement over the check plots, which received no lime. These check plots have practically no growth whatever owing to the roots being destroyed by club root.

It was noticed that in cases where the lime had not been deeply incorporated in the soil and the roots had gone below it there was slight infestation.

For those who have trouble with club root, it would be best to start now to eradicate it. Any infested plants should be destroyed by burning. Any plowing to be done should be done deeply and left rough.

Apply the lime, preferably crushed limestone, since it is more easily handled in large quantities. For small garden plots the burnt, air slaked lime can be readily used and will give quicker results.

Apply from four tons upward per acre of crushed limestone accordingly to the amount of infestation, or from two and a quarter tons upward per acre of burnt lime. Do not plant a cruciferous crop more often than once in four years. A longer period would be better. Carry on a proper rotation.

CLOVER SEED GROWING IN NOVA SCOTIA

It is only within the last half-dozen years that any extensive effort has been made by Nova Scotia farmers to grow clover seed. The high prices now prevailing, and likely to continue for some time, have stimulated interest in this side line. One of the chief difficulties in former years has been the threshing of the crop. This drawback has now been largely overcome. There are now three hullers at least in the Province, all of large capacity. One is owned by a group of farmers about Somerset in Kings County. Another is owned by a group in the vicinity of River John, in Pictou County. The third is the Government owned huller, which is available for any part of the Province where there is a reasonable amount of clover to be threshed.

The Provincial Department of Agriculture gave some assitance in the purchase of the two community owned machines for the purpose of encouraging this very important industry. With the same end in view the Government owned huller is being moved about to accommodate districts which as yet have not developed the business of clover seed growing sufficiently to justify purchasing.

Plans have now been made for the Government machine to begin operations at Mabout, Inverness Co., early in December. From there it will be moved to Antigonish, thence to Lawrencetown, Annapolis County, Bridgewater, Musquodoboit and Truro.

At Mabou, the most easterly point at which any extensive effort has been put forth along this line, farmers last year threshed several hundred pounds of clover seed, and they expect to do equally well this year. Late reports state that the River John group will thresh several thousand dollars worth of seed this year, and that the Somerset district will also have a substantial quantity.

Every well informed farmer knows the value of clover as a means of increasing the fertility of the farm. Its use was rapidly increasing in Nova Scotia until the past two years, when prices began to soar, first doubling, then almost trebling. This, with the scarcity of seed at any price, has considerably reduced its use.

The way out is now plain. It has been abundantly demonstrated that clover seed can be successfully grown in the districts indicated above, and there is no reason why it should not be grown all over the Province. It would pay more farmers to correspond with the Department of Agriculture, and receive any instructions they feel the need of as to proper methods of growing this valuable seed.

THE FANNING MILL

In olden times threshing and winnowing were rude and rough processes, separating in a general and indiscriminate fashion the grain from straw and chaff. The modern progressive farmer is exceedingly careful to have only the very choicest grain for seeding purposes. The Ontario Department of Agriculture recently issued this statement: "The fanning mill, properly used, makes it possible to plant less grain and yet harvest 20% mor crop." The reliability of the statement has been abundantly demonstrated in the experience of Nova Scotian farmers.

Before the war there was a substantial number of fanning mills in Nova Scotia. While the war was in progress it became more and more apparent to every one that measures would have to be hastened to conserve the home grown grain for seeding purposes, and the Department of Agriculture paid a bonus to many more purchasers of mills to this end. It is now a commonly accepted fact that the home grown grains are superior, when properly cleaned, to anything that can be purchased in outside markets for seed.

Farmers who have their own mills will, of course, plan to use them. Many others who do not own one themselves can arrange to have their wheat, oats, and barley put through their neighbor's mill. It would be a wise policy for every grain grower to look over his bins at an early date, selecting the best and thoroughly cleaning it for seed purposes. There are few things that he can do at this season which will give him as much satisfaction and as good return later on. It is so easy to allow matters of this kind to lie over until the seeding season is at hand. Then the pressure of other work, and the occupation of the mill with the owner's work prevent its being done at all. Make sure at the earliest possible date of a good supply of home grown, well separated and cleaned seed for the Spring of 1920.

CONSERVING THE POTATO CROP

Experienced potato growers know the necessity of picking over the bins carefully and removing all infected tubers. They have learned by costly experience that a single rotten potato in the heap will, in a comparatively short time, spread the infection until nearly all are rotten.

In other days, when potatoes were worth only a few cents per bushel, the precaution was not so important. With present high prices, and the prospect of higher prices still. the situation is different. In a season like the present, when rot is prevalent, a man can make big wages on stormy days by going over the heap thoroughly and throwing out the rotten ones.

Jottings From the P.E.I. Dept. of Agriculture

Few farmers or dairymen recognize the great importance of individual cow testing. Agricultural Departments in all modern dairy countries have in recent years appointed a number of officials whose duty it was to visit farmers and endeavor to get all cow owners to take up this work, the importance of which is only realized by those who have followed this system over a period of years in endeavoring to build up a high producing herd of dairy cows. The plan is not to weigh every milking, as this would entail quite a loss of time, but to weigh the milk of each cow morning and evening, taking a sample of same every ten days, or three times in the month on record sheets supplied by the Department, and take samples carefully in bottles containing a preservative when returned from the creamery or cheese factory each month. If this work is carefully done at regular intervals of a 24 hr. day, we will have a yearly record of production of earh cow quite accurate enough for us to select and cull our herd by, but let no man think he can learn the percentage of fat produced by any cow by taking one or two samples. Only by carrying on this work persistently can we have any accurate knowledge of what each individual cow is worth. I have followed this practice for 14 years with the exception of one year when we were short of help and I soon saw the necessity of continuing it, and would not now think of conducting a dairy business without testing regularly. Just why so many continue to go in blind in their dairy work is hard to understand. If such men were taxed, even so little as one dollar a head on these cows, we would hear loud lamentations of the injustice of such procedure, but when it is clearly shown that they have several cows earning them from $10.00 to $25.00 a year less than their average or best cows, they do not seem to mind this loss, which is in reality a much greater tax levied by the cow, but they continue her in office or do nothing to try and find out if they are keeping any of that calibre. There is no reason why any dairyman cannot keep track of the work of his herd. In no other line of live stock feeding is it as easy to do so. There is no necessity as in the case of beef cattle or hogs of having to wait for six months until a sale is made or a slaughter executed to learn how the experiment has turned out. We can weigh our feed each day and our milk at the same time. The Babcock Test will show us the fat content and we may know from day to day how each cow is performing, and while it is not necessary to weigh feed continuously, the more we do and the closer watch we keep on the intake and output, the more we will learn of our business, and the greater will be our profit, and I care not how extensively a farmer may be in dairying it will pay him well to weigh and test his herd continuously year in and out. In my own herd I cannot afford to stop, it would mean a loss of hundreds of dollars annually, and the longer we have followed this cow testing the more we learn, as our record sheets prove. If a cow freshens in good fleshy conditions and is properly cared for, she will test considerably higher for the first two months than she will average over the full lactation period as a good producer will at this time "milk off" stored body fat, and we have learned that at any time in the year she may be losing flesh while milking, she will test comparatively high, and if at any time she gains in weight or fattens she will test lower than her average for the year.

Individual cows vary greatly in their fat production. We have discovered in certain instances where a cow whose average yearly fat test was 3.2 per cent, tested 4 and 4.2 per cent for the first two months, gradually decreased until she touched as low as 2.9 in the latter end of her milking period. This cow was a heavy milker, and as a good doer laid on fat during the two months she was dry. Had anyone taken single samples during any one week of her lactation period, they would have had no idea of the kind of a producer she really was. Quite recently a two year old heifer freshened and we started in our regular monthly test finding her first month's average 4 per cent fat and we hoped she was a high tester; the second month showed just 3.0 per cent and the third 3.2 fat, but we will have to follow her the entire year to learn just what her average test may be; even then if the cows are not in normal condition in every way we do not know what their worth may be as condition, not feed, causes the variation in fat content and the ability to produce milk rich in fat is hereditary, but variations in each cow's milk will occur from the condition of flesh and the time she is milking more than from any other cause that I am aware of although certain methods of feeding will raise the per cent of fat in a cow's milk, it will only hold for a comparatively short time, and while a skilled feeder may raise the fat content it will only last until her system becomes accustomed to the manipulation of feeds. I have done considerable experimenting in this work, have entered every dairy test possible and conducted weekly and yearly official tests on my farm; it has proved most interesting and valuable work, and from our results I can quite understand why percentage of fat at the creamery in milk varies from month to month. The accuracy of the Babcock Test is established beyond the shadow of a doubt. No man need think he can fool this method of testing milk. In the best dairy centres where it has been in use for years, we never hear of anyone doing so, although complant is often heard where it is not regularly done, and when we bear of herds of cows testing at the factory lower than the owners think they should, you may be sure they are putting the fat on their backs.

We once ran three heifers in yearly official record work, which must be done by the owner under oath, some official of the Government overseeing the work and doing the testing. These same heifers were also tested in our Cow Testing Association, and it was interesting to follow the work being done by two different men, neither of which knew the other was doing it, and I was pleased to note how closely their work agreed. Those heifers calved in November and in the month of June and July as they were under official test we fed them a good meal ration (which is not our custom under ordinary work) and we soon noticed they were gaining in flesh and that month's milk tested the lowest of the year's work. In August the pastures became slack and as they were heavy milkers they failed slightly in quantity, became noticeably thinner and immediately their tests became higher. On many occasons I have noticed that if at any time during a cow's milking period she started to fatten or fain flesh, her milk tested lower. The Danes have made exhaustive tests on some 300 cows to learn if possible, how to control the percentage of fat, and though the result of these experiments has shown that the ability to produce milk rich in butter fat by any cow is hereditary, that feed does not influence the percentage only for a limited time, or until the cow's system becomes accustomed to any marked changes, that condition has a great deal to do with the percentage of fat in the cow's milk, and a cow above or below normal will vary considerably in fat and if we would increase the percentage of fat in our herd, the first move we should make is to learn which of our cows are the best producers by a system of testing carried on long enough to establish this beyond question. Then select a sire for your herd whose immediate ancestors have proven to be producers of high testing milk for the breed, but do not condemn a cow because she may not test just as high in fat as you would like. A cow should not be judged by the pounds of milk she gives nor the percentage of fat, but by the pounds of fat. If a cow gives 40 lbs. in a day of 5 per cent milk, she is a superior animal. This is two pounds fat a day, 50 pounds 4 per cent milk is the same, 60 pounds 3.4 milk is slightly over this, as is 70 lbs. 3 per cent milk being 2.10 fat. If we condemn a cow because she tested only three per cent we would punish her for throwing in 30 lbs. more of skim milk than her 40 lb. 5 per cent sister.

WALTER M. LEA, A.S.M.

Can You Grow Potatoes like this?

With a reasonably good soil and rainfall and the liberal use of Harab-Davies Fertilizer, you can be sure of a potato crop superior in both quantity and quality. The potato shown in our illustration was grown by a New Brunswick farmer who is a consistent user of Harab-Davies Fertilizer. He sent us this potato as a good average sample of his crop. There's no magic about it. Harab-Davies Fertilizer is simply an efficient plant food, containing Nitrogen or Ammonia, Phosphoric Acid and Potash in readily soluble form. Its record of success is its truest recommendation. Write us to-day for our booklet, "Fertilizer Results by Satisfied Users." It will be sent free on request, and it will give you evidence in the shape of signed letters from farmers in all parts of the country who know by experience how **profitable** Harab-Davies Fertilizer is.

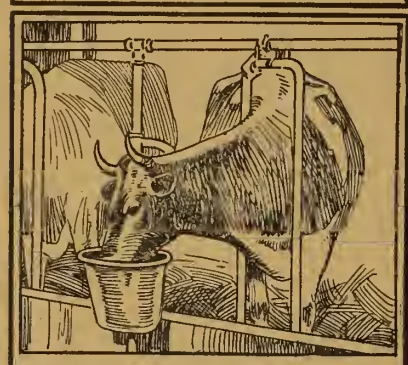
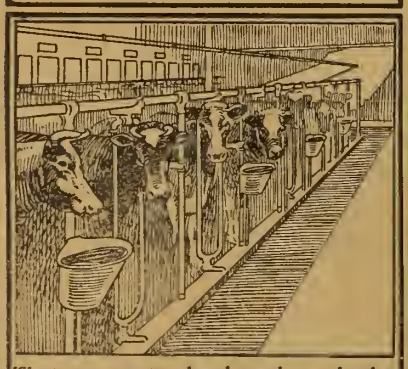
Butter Parchment at Farmer Office

Mr. Jos. Brown, of Bruce County, Ontario, had a good cement tank in his shed. It was always full of water and he drove the cows out to it at nine in the morning and 4.30 in the afternoon. Of course that was a pretty cold job in winter.



A friend suggested to him that he test the amount of water the cows actually drank from that tank. He pointed out that cows would not drink enough cold water at just two definite times a day. Even, if they did, it would injure them. He suggested putting in water bowls, so that the water would be before them all the time at the right temperature.

Mr. Brown made the test. He watered the cows in the ordinary way at 5 o'clock; then he went in and had his supper. After supper he carried water in pails to see how much they would drink. He carried 20 pails of water for his ten beef cattle.



That was pretty hard work, so he let his cows and the rest of the stock go. He figured, though, that the stock were certainly not getting watered properly at the tank. He put in BT Water Bowls right away.

It will not place you under any obligation to get information about the BT Water Bowl.

The coupon will bring it.

DAIRYING.

A GREAT MANY CALVES THAT WOULD GROW UP TO USEFUL COWS ART LOST IN CALF-HOOD

A great many calves are lost in calfhood—die at birth or die of scours before they are six weeks old. Many others are lost later from blackleg say, because they were not vaccinated against the disease, and a great many calves simply do not grow into the animals they should because they never had the feed necessary to make them what nature gave them the frame and constitution to become—in other words they were stunted and underfed during the only period in life when growth could be made, the first year of life, partcularly the first winter.

There can be no question at all as to the kind of sire and dam a calf should be from to make the kind of success it should be in life. The pure bred sire is the corner stone of successful cattle raising and the first essential in the raising of good calves. First of all the cows should be bred to a pure bred bull; that is the first step in raising better farm calves and a very important first step too. Then to give the calf a fair chance at the start its mother should be dried off and fed well for at least 6 weeks before calving. Calves from cows that are not rested betwen lactations are usually undersized and weak. Calves from cows that are not reasonably well fed during pregnancy are likely to be similarly handicapped. To be small and weak is a serious handicap for a calf to start life under. To be small and weak from a scrub bull is a handicap that no calf ever was able to overcome no matter what care, feed and attention was lavished on it in calfhood or after life.

The calf should be left with its mother for the first two to four days so that it may get the colostrum, or "first milk." From that time until it is four weeks old it should be fed from two to five pounds of its mother's milk three times a day. Many experienced breeders feed calves which are weak a smaller amount but give it four times a day. It is well to remember always that there is more danger from overfeeding a young calf than from under-feeding. To warm and bring milk to the proper temperature, it is best to set the pail of milk into warm watr. Scaldng milk by turning live steam into it makes it hard to digest. Hence, this system of heating milk is not advisable.

Many calves as well as their feeders experience serious difficulty when the calf is first taught to drink. It is useless to attempt to teach a calf to drink until it shows some signs of being hungry. Coaxing the calf ten to twelve hours after it has been taken from its mother, when it ordinarily begins to show signs of hunger, by letting it suck one's fingers and gradually leading its head into the pail is the best mestod of teaching it to dring. The fingers should be withdrawn as soon as the calf begins to take the milk. The calf, after being coaxed in this manner for a few times ordinarily learns to drink from the pail with little difficulty.

Durng the fifth week change gradually from the whole to skimmilk. Do not increase the amount fed until about the eighth week, when the calf needs from six to ten pounds twice daily. Froth, which rises on separator milk ,should not be fed to calves. It is almost sure to produce indigestion, bloat and scours. If available skimmilk can be fed profitably until the calf is a year or more old, but in order to get the greatest returns rfom the milk, the amount fed to any calf should not exceed 20 pounds a day.

A good grain mixture for young calves consists of 60 pounds of whole oats, 30 pounds of wheat bran, and 10 pounds of oil meal. Many feeders feed equal parts of oats and bran. Some use whole oats. In any mixture oats should be the chief grain used.

When the calf is from ten days to two weeks old, give it a small amount of clover, alfalfa or grass hay. Avoid feeding hay or any other kind of feed that is moldy. A little later give a very small amount of grain and increase the allowance gradually as the young animal develops. It is well to keep a calf a little hungry, rather than to tax ts digestive organs . A calf's appetite and the condition of its bowels are the two arms to the guide-post which mark the course the feeder should follow. Occasionally, a craving appetite for hay and straw results in too much being eaten and indigeston follows. In such cases separate the ailing calf from its mates, and reduce or change its feed until the apptite becomes normal.

The calves should be separated and penned in groups according to their ages. They can be fastened to stanchions when milk is fed and grain can be supplied them immediately after they drink. Feedng the grain at this time and keeping them locked in the stanchions until the grain is eaten help to overcome the habit of sucking. Calves that continue to suck one another after being turned loose should be separated, or some other means should be taken to prevent the practice. Heifers often have their udders injured by being sucked.

After calves are six months old less grain will be wasted if it is ground. The amount of grain fed should vary form a small handful for the young calf to three pounds or possibly more in some instances, for heifers from 24 to 30 months of age. If, for any reason, a heifer is thin, an extra amount of grain should be fed to get her in condition.

During the first year feed the calves regularly in the barn and turn them out for exercise in shady paddocks or during the nights only. When convenient they may regularly be fed in paddocks. This will insure satisfactory growth at an age when it may be secured at lowest cost. Supply water and salt daily.

Calves that scour may be treated in this manner: As soon as symptoms appear, give the calf two to four tablespoonfuls of castor oil mixed with one-half pint of warm fresh milk. After four to six hours give a heaping teaspoonful of a mixture of one part salol and two parts each of sub-nitrate

Sold for 25 years

15 different models including Radiolites that tell time in the dark

Canadian factory. Canadian workers.

Radiolite—tells time in the dark. The hands and figures are coated with a substance containing real radium ⅞ actual size

of bismuth and bicarbonate of soda. Purchase these at any drug store mixed in the proper proportions ready for use at any time. This, too, can be given in one-half pint of milk or the powder may be placed on the calf's tongue and washed down with a small amount of milk. The dose may be repeated at intervals of four to six hours until scouring ceases. The allowance of feed should be reduced at once and not increased until the condition of the calf warrants it. In mild cases castor oil is unnecessary and, therefore can be omitted.

As a precaution against scours, do not over-feed; have milk at proper temperature; feed mlk regularly and from pails that are scrupulously clean. If possible, feed the calf its mother's milk; if necessary to feed other milk, choose a cow which has recently freshened and continue regularly with her milk. Make any changes in feed gradually. Guard against feeds or materials that will produce indgestion such as sour milk, moldy or very coarse or woody feeds, and paint, blankets and sacks, which calves will sometimes eat. Keep calves clean, dry and out of cold draughts of air. Give calves subject to scours a half-pint of lime water in their mlk for a week.

The most dreaded form of scours is contagious and is known as white scours. It occurs only in newborn calves. It may be prevented thus: Remove the cow to a clean, dry box stall when she is about to calve; wash the cow's tail and udder with a 3 per cent. coal tar solution; disinfect the calf's navel with tincture of iodine; have a veterinarian inject white scours serum as soon as the calf is dropped; destroy all excrements and soiled bedding and disinfect the stable at frequent intervals.

COW WITH GARGET UDDER DRIED UP

Two weeks ago one of our cow's udders commenced to cake. I bathed it with hot water and salt, then sent for Vet. The swelling has gone down gut the udder has dried up.—J. B.

Ans.—This s no doubt a case of garget or mammitis, a cararrhal inflammation of the lining memberanes of the ducts of the teats, milk reservoirs and tubes leading to the milk secreting cells. It is caused by exposure t odrafts or rains, lying upon cement floors or wet frozen ground, standing in cold water, bruising, chasing by dogs, injury rough, irregular or incomplete milking, overfeeding of feeds rich in protein or sudden changes in feed.

In the simple form, the udder becomes

There are different forms of garget. swollen, red and hot and the milk becomes pale yellow or is tinged with blood containing clots or curds. There may be some stiffness in walking. Mild attacks usually subside in a week or ten days. The udder should be bathed in hot water and thoroughly massaged and the milk stripped out of the affected quarter. Three times a day rub the udeer with a mixture of 1 part each of turpentine and fluid extracts of poke root and belladonna laves and 5 parts of warm melted lard or sweet oil.

The simple form may turn into the acute garget in which the symptoms are all more pronounced, the affcted cow having chills and fever, loss of appetite and the milk may have a foul odor. Abcesses may form and discharge pus. The affected quarter is permanently ruined unless prompt treatment checks and cures the attack, which is very difficult to do. The cow should be given a half ounce of saltpeter in the drinking water or as a drench every four hours and if necessary, a physic of epsom salts and linseed oil should be given to evacuate the bowels. The udder should be treated as for simple garget.

The most dangerous form of garget is that caused by bacteria. This is highly contagious and is dangerous to people as well as animals. Pus forms in the swellings or sores on the affected animal's udner and in extreme cases gangarene sets in and the diseased quarter slough off. In cases of this kind the affected animals should be isolated and the stables thoroughly disinfcted. The udder should be washed clean and the swellings painted with iodine . The best plane, perhaps, would be to consult a good veterinarian and follow his directions as to further treatment.

DE LAVAL

the world's standard CREAM SEPARATOR

"It is so much easier than the old way."

In these times of high butter prices and scarcity of labor, no housewife should bother with the old-fashioned gravity method of skimming milk. The De Laval Separator will recover one-fourth more cream and do it with less work and in shorter time.

Neither is there any excuse for struggling with a half-worn-out or inferior separator that wastes cream and is hard to turn and difficult to wash. The work can be done much better, quicker and easier with the De Laval—the world's standard separator.

By purchasing a De Laval now, it will have paid for itself by spring

THE BETTER SHEEP CAMPAIGN HOW TO CONDUCT IT PROFITABLY

There are few letails of the mixed farming business more worthy of interest and study to the farmer than the matter of increased flocks and better sheep on the farm. Unusual conditions prevailing for the past few years, of course, have accounted for the abnormal figures this farm product has brought; and yet it is safe to say that never again will the price of sheep and sheep products fall back to the old level, when keeping them was not considered profitable. It does not require the eye of a prophet to see that for a long time to come, and perhaps always, wool will bring remunerative prices. It is, therefore, gratifying to find that these profitable animals are now finding many new homes. In some respects during the past few years, the change has been a little hurriedly made for the sake of taking advantage of prevailing high prices, and under these conditions men have not been as particular as they should have been as to the quality o fsheep they have bought. To get wool and sheep has been the uppermost thought regardless of the grade of sheep they have bought on to their farms, but a more profitable policy to have pursued would have been to have invested in the highest possible grade of sheep, even though it might have taken a little longer to have realized paying returns from them.

Choosing the Breed

To assist farmers with an ambition to own the best sheep, there are sheep breeders' associations aiming to foster the breeding introduction and improvement of every individual type of sheep. In the point of choosing of the class of sheep, it is not a question of breed at all, practically speaking, but one of individual. In almost any of the breeds can be found sheep with desirable qualities of both wool and mutton, and these are the ones to be assiduously searched for. For the climate of Ontario and Quebec or for northern climes generally, as well as for market conditions, there is probably little doubt but that one should select sheep from among the medium wool, mutton type breeds; but beyond this distinction there is little choice as to breeds. Those who continually make the inquiry, "which is the best breed of sheep to grow?" the subject of inquiry, might far better direct their attention to a determination of which is the best individual to grow.

Breed associations are all working together to further the interests of the sheep lover, and therefore it is not so difficult as it usd to be to find first class sheep. With the Fair season at its height, one has opportunity to campare the different breeds and satisfy himself to some extent as to the variety he would like best.

It is worfh while to think of this carefully. The kind of sheep which might do well with one farmer, might not in the case of another; for all have not farming lands that are adapted to certain types of sheep. Neither are farmers all constituted alike. One man may like to care for one kind of sheep, while another may find an entirely different breed to his liking. It is best, however, so far as possible, for the farmers of any given part of the country to keep some particular kind of sheep. Then they can visit each other's farms and compare notes and, better still, work together for the breeding and sale of their individual line of sheep.

Grading the Flock

In point of wool it is a common practice with not a few farmers to consider a fleece just a fleece, without regard to its nature. In the same flock will be retained for years sheep that yield excellent fleeces, and right beside them others that yield inferior ones. There ought to be continual observation made, if not actual records kept, so that intelligent discrimination can be made, and such sheep as are not satisfactory should be culled out. Those who are doing this are making no mistake. They are clearing out their old stock absolutely beginning with practically new stock that costs more, but which is unquestionably better.

Farmers who are inclined to stay their hand at grading their flocks, by considering the cost and sacrifice of ridding themselves of the low grade and inferior class, to allow the introduction of something far superior, are losers in the game. Though they may not be able to get as many high grade sheep as they would like at the outset, they should be satisfied with what they can get. In dispensing with poor sheep or sheep a little above the average, there is always some sacrifice to be made, for one cannot get as much for such sheep as they will have to pay for better sheep. It costs to produce fine sheep. The man who does it must put all his energies into the work he is doing; he must feed right, he must breed right and he must give the right kind of care all the way; and it stands to reason that he will have to ask more for the product of this good care and treatment. But by and by the farmer who invests in the better class of sheep will realize, with pleasure, the change he has made when totalling up the returns from the sales of wool, mutton and surplus sheep and lambs. It is not wise to be hasty about fhe big flock; better go slow and right. It is always an advantade for farmers to work with one breed, and stay with that breed, for indiscriminate crossing will lose him all the money he has invested in the better sheep campaign he has started on his farm.

THE DAY THE BULL SHOWS FIGHT—HOW TO PREPARE FOR IT

Every bull should be handled and managed at all times as though he were known to be dangerous. He is dangerous, whether he has shown symptoms of it or not, and some day may make the fact sorrowfully manifest. A bull that is known to be a cross fellow never does any harm, simply because he never gets the chance, but it is the gentle animal, the one that has a name for docility that gets his chance when he has the "spirit" to take it. The wild nature inherited from ancestors still lurks in all domesticated animals, and the bull is the most formidable of all. All other species of animal only show the disposition to fight when badly used or irritated by man, but the bull will attack without proovation. This difference must always be kept in mind when dealing with the different farm animals. Forgetting the fact and trusting to the methods of handling of the bull in the past, is if he were a harmless exception to the rule, has cost many a bull owner or caretaker his life. Years may pass without anything happening to injure his reputation, but all the while he may

The Farmer's Opportunity To Start the New Year Right

Opportunity knocks at the door of every Farm Owner and Farm Operator. Opportunity to increase production. Opportunity to assist a Returned Soldier who is anxious to become a Farm Owner.

Many Returned Soldiers are anxious to engage with high-class Farmers for the winter and next season. They need experience. They want to qualify to become beneficiaries of the Soldier Settlement Act.

The outlook for the Agricultural Industry is promising. Increase your area of production and in doing so assist a worthy man to become a Farmer.

Write the nearest office of the Soldier Settlement Board and ask for a good man—a helper and a co-worker. The Board will be glad to send you one who is in earnest and, therefore, will be worth much to you.

DISTRICT OFFICES AT: Victoria and Vancouver, B. C.; Edmonton and Calgary, Alta.; Regina, Saskatoon and Prince Albert, Sask.; Winnipeg, Man.; Toronto, London, Fort William and Ottawa, Ont.; Quebec and Sherbrooke, Que.; St. John, N. B.; Halifax, N. S.; Charlottetown, P. E. I.

THE SOLDIER SETTLEMENT BOARD

Union Bank Building, Ottawa, Ont.

be waiting his chance.

The proper handling of the bull, from calfhood up, is of material interest to the owner as the other duties of feeding, etc. The period to inculcate obedience is in childhood, and the time to teach him this domestic duty is when he is quite young. He will resent the treatment necessary ot his training less at a month old than at any subsequent time. The bull should never be teased, as this will surely develop the fighting instinct, and any liberties on his part should be met with firmness. Neither should he be petted, as this familiarity might one day be treated by him with contempt. Nor should anyone be allowed to handle the bull, young or old, who is nervous, as he will be quick to notice this weakness, and be ready to take advantage of it. Often an attack from a bull comes from this cause, which could have been overcome at its initial stages by a corageous man. The number of casualties every year disclose clearly the wisdom of taking all necessary precautions in the handling of these animals.

Bulls should be rung only when a few months old, and trained to lead with the ring, without harsher treatment. The first ring will be better if a light one and then change for a heavy one later on. If a bull is suspected of being inclined to be vicious, his head should always be kept high while leading him. Some bulls, if they get their heads down, will prove dangerous even when well rung. To aid the man in charge, a staff with a heavy steel spring hook must be provided. It must be dependable, and not of the ordinary fork handle socket type. They are not safe. It must always be remembered that it is on the stability of the staff that the life of the caretaker, or whoever may be around, depends. Perhaps the safest hook for fixing the staff to the ring will be one provided with a small thumb screw.

If the bull is exercised in a yard or has of necessity to be let loose, it is always safe to have a yard or two of a drag chain fixed to the ring.

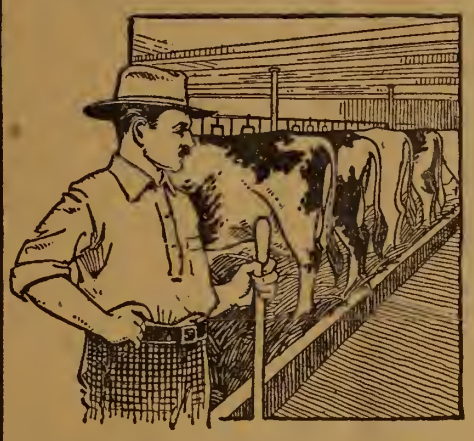
The yard in which the bull is exercised should be provided with a wire rope, to which the bull can be attached to a slip ring, and thus give him facilities to range the whole length of the yard.

The temperament of the bull depends largely on his training. "The boy is father to the man," and in like manner the "calf is father to the sire." The care and handling of the bull is a serious proposition, and the man in charge must always keep in view the fact that he is dealing with the most formidable animal of any in the history of domesticated animals.

DRENCHING SHEEP

A very satisfactory method of drenching sheep by use of raw linseed oil given in about four to six ounce doses. Every care must be taken, however, to prevent any of the liquid from going down the trachea to the lungs. If this does occur it will cause death. Gentleness is of great importance in this process as well as in all other processes in handling sheep. A very good way is to back the ewe into a corner, letting her stand on all four feet, holding the nose until it is high enough to prevent the liquid from running out of the muoth. Do no ttry to force the nose too high up. A two ounce syringe can then be used, forcing contents slowly down the throat. Hurried use of the syringe may cause pneumonia.

Systematic Feeding PAYS!



Simplify your Feeding Problem by using—

MILK yields depend largely upon the feed. Don't just trust to luck in your feeding. Make it systematic. If you plant poor seed you don't expect a good crop. Why look for good milk yields from cows that shift for themselves or have poor feed? The upkeep cost of cows decidedly warrants a feed that will make them able to give maximum milk yields. Feed systematically by using

Monarch Dairy Feed

It turns "boarders" into profitable producers. It is rich in protein supplied by oil cake meal and cotton-seed meal. For bulk and palatability there is bran, corn feed and barley feed. The slightly laxative quality of the oil cake meal is balanced by the tendency of the cotton-seed meal to be constipating. This combination of feeds is perfectly balanced. It means fine, healthy stock, and better yields of milk.

Monarch Dairy Feed, while very rich, may be fed alone. Guaranteed analysis: Protein 20%, Fat 4%.

Give Monarch a trial. Order a ton from your dealer. If he does not carry it write us direct. Ask for booklet, "Getting the Most out of Dairying."

MONARCH HOG FEED

A special Feed that meets all the requirements of the brood sow and the growing pig; consists principally of corn meal feed, shorts and digester tankage. Guaranteed analysis: protein 15%; fat 4%.

SAMPSON FEED

This general purposes feed is somewhat similar to Monarch Hog Feed, except that oil cake meal is used instead of digester tankage; it gives results for both cattle and hogs. Guaranteed analysis: 10% protein and 4% fat.

WHITNEY'S LASSIE, A CANADIAN AYRSHIRE WITH A REPUTATION FOR PRODUCTION

This pure-bred Ayrshire cow has the highest production to her credit in the last list of cows completing a year in Canaditn Record of Performance, with 16,081 lbs. milk, 659 lbs. fat and a test of 4.09 per cent. fat. She is half sister to Scotch Thistle, the cow holding the three-year-old championship for production in Canada. Whitney's Lassie, as a three-year-old, gave 10,804 lbs. of milk and 448 lbs, butter fat in R. O. P. She is now eight years old and has given her owner, John A. Morrison, of Mt. Elgin, Ont., six heifer calves and one bull, has been a heavy producer every year and is making as well now as she ever did.

LICE ON PIGS

Crude oil is coming into general use as a means for keeping hogs free from lice. In using it in summer some put a gallon of oil on a water pool and allow the pigs to wallow in it, which they do with evident delight. The oil may be added every four weeks or so. It is not advisable to oil pigs in the winter as the oil gets cold, even when applied by a sprayer. One of the commercial disinfectants that quickly dry up are the best for winter months.

HOW TO PREVENT PARALYSIS IN HOGS

Farmers who are having trouble with paralysis in hogs, or "going down behind" as some call it, will be interested in the following suggestions concerning the disease made by Dr. McIntosh of the Illinois experiment station:

"This is a very common disease in sows, especially in fine bred animals. I have investigated this derangement and find it is caused by a want of sufficient phosphate of lime in the nerve system especially the nerves supplying the hind legs. It is a known fact that the bones and nerves of pregnant animals are deficient in phosphate of lime, on account of the drain on the system for phosphate to build up the foetus, and also to nourish the young after they are farrowed. There seems to be more of a drain for phosphate on the system of the sow than any other female animal. The sow is more frequently affected with partial paralysis a few weeks after farrowing, although the derangement may occur before farrowing.

"To prevent this trouble, the sow should be fed on ground oats, bran and oil meal, and as much milk as possible, during pregnancy and while suckling young pigs. Should the trouble occur at either of the above-mentioned periods, the following treatment should be begun as soon as the animal shows the first symptoms of weakness in the hind legs, or knuckling over at the fetlock joints. Of course cases can be cured even after the animal is down and cannot get up. Give one tablespoonful of cod liver oil, 15 grains phosphate of lime and three drops of the fluid extract of nux vomica in a little food, as a dose twice a day. This treatment should be continued for several weeks if needed.

"Through experience it has been found that pigs from a sow that has had an attack of partial paralysis are no more likely to be attacked by the disease than pigs from a sow that has never had the disease.

"A sow that is affected with paralysis does not seem to suffer any pain, indicating that the disease is a local one, and if the animal can be fattened while in this condition, the flesh would be fit to be sold for pork."

Feed all that the cow will respond to in milk production.

Civilization marches forward on the feet of little children.

GOMBAULT'S
CAUSTIC BALSAM

A safe, speedy and positive cure for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a HUMAN REMEDY for Rheumatism, Sprains, Sore Throat, etc., it is invaluable.

Every bottle of Caustic Balsam sold Warranted to give satisfaction. Price $ 1.75 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

THE HORSE

THE PRACTICE OF BREEDING MARES SO THAT COLTS ARRIVE IN FALL AND WINTER MONTHS

In nature all young are generally born in the spring months, just the season that nature provides the succulent food for the necessary milk flow. In domestication of animals man many times upsets the natural law, and foals and calves are born out of season. The dairyman requires milk all the year round, and the horse breeder can time his breeding operation whereby the mare can rear the colt in winter when her services are not required on the field. Those farmers who adopt breeding operations to fit their own convenience succeed best if they provide by artificial means in winter the natural conditions of spring time and early summer.

Is Not Practiced in Britain

Some horse raisers advocate fall colts. It s a custom that is never practised in Britain, but there is no reason why it should not succeed in Canada where climatic conditions are different. There are very few farmers who make horse breeding a specializd part of their business colts are reared on farms just as a side issue. Most of the colts arrive in the spring or summer just when mares are needed in the fields, and too often the animals are overtaxed or overheated, both before and after the birth of the offspring; or the latter are given access to heated mlk, neither of which has ever been found to be benficial and often results in the loss of a valuable colt and not infrequently in the loss of both mare and colt. Many times too, the hay and grain ration gets to be a scarce commodity in the spring months, when early grass is quite a way off, just when mares require their full and regular ration. Yet the mares must help to put in the crop just when most in need or absolute rest. Short rations, coupled with hard work are not conducive to good results.

Advantages of Winter Foal

As a rule mares are not likely to be working hard in the winter, and even so, there is less dangr in beng ovrheated in cold weather; feed is likely to be plentiful until the colts are old enough to subsist otherwise than on the mother's milk, and only moderately warm quarters are essential in the average winter climate. With accommodation and abundance of food there is no reason why mares should not be made to foal in the fall if it is more convenient to have them do so. In fact, if one is forced to choose between a spring foal with no chance properly to favor the mare, and a fall foal which arrives and is suckled while the mare is laid aside from ctive work, the latter would be more desirable. During winter, however, both mare and foal will require more attention than if bred to foal in the spring.

There s a great advantage also to be gained to the foal when it is weaned in the spring time. The weaning period more often than any other in the history of the animal is the period that stunts the growth of most horses. When spring activities commence, the mlk flow will be about dried up in the mare, and a good substitute for the foal will be found in the early grass. This suculent feed in the early spring months forms the best weaning ration to be had. It furnishes an almost complete ration without entailing labor on the part of the attendant.

Adverse Conditions to Foal Rearing

One drawback with the winter foal is the opportunity for good hoof and leg development. There is nothing like the exercise of the open field for this. Many young colts of good conformation and breding are born with weak legs, and hoofs only partially developed. The winter box stall is the worst place for hoof and leg development, and this fact ought to exercise the chief attention of the horseman who has under his charge a winter born foal. The stall should be kept clean and free from heated manure. The foal's hoofs should ge on the hard ground all the time. When kept on heated manure for days together and then allowed out to dance around on a hard and frozen yard there will be hoof trouble all through the life of that colt.

Daily exercise is of the utmost importance when weather will permt. There are many days in winter that the mare and her colt cannot have the outside exercise owing to extreme cold or stormy weather, and on these days the stall must be kept free from a collection of manure.

Training the Hoof

To grow feet in the best possible manner they should be frequently and carefully inspected. As a rule it is necessary to shorten the toes and this should b done with the rasp; in fact no other tool should be used on a young colt's foot. Where the toes are kept short the quarters will usually take care of themselves, for the frogs will bear upon the ground, and keep the heels properly spread. Particular attenion shohld be paid to the frog, for if it gets out of contact with the bearing surface, the foot will rapidly lose its proper shape; the heels will contract and the walls at the quarters become brittle, weak and prone to split; either from above or below. The growing of the hoof must b judiciously directed. It is due to the lack of this attention that so many bad-footed horses are to be seen on the streets of the cities.

To keep up the milk supply is another necessary point in the growth of the winter foal. The dry winter feed is not nearly so conducive to milk flow as is the good clover pasture of summer. But clover hay for forage, and oats and bran for grain ration, will be found admirable substitutes. There is no use in thinking that the maintenance ration that

is the usual fate of the idle horse in winter is enough for the mare that is raring a colt. In addition to proper feeding it is likewse necessary to protect the young developing animal against every possibl cause of debility, discomfort, and unhealth that would tend to retard its growth. Shelter must therefore be sufficient diseases must be fought against, vermin must be prevented from sapping constitution, and fresh air, sunlight, adequate exercise and kindly care must take a full part in perfecting the developmnt of the animal.

The Breeding Ration for the Mare

The spring time being the natural time for a mare to breed, it is not always possible to get the desired winter foal. She is often in a rundown condition after the busy season, and the dry ration of winter also mitigates against coming in heat. By giving liberal quantities of succulent food and a full ration of grain, the desired result can often be brought about. Blanketing of the mare will also aid to bring the oestrum period. The bowels should be kept free from constpation by feeding moderate amounts of succulent foods.

As a rule, mares are not likely to be working hard in the winter, and this condition gives some advantages this condition gives some advantage in having the foal arriving in the fall. But one must always remember that the brood mare is kept busy all the year round, giving milk all winter and labor all summer, therefore she should be fed accordingly. And this more especially true if the mare is bred again. A mare is not standing idle when rearing her young foal, and she is also doing double work when carrying a foal while keeping up her end of the hitch. Doubtless there is room for argument regarding the advisability of having summer or winter foals but those who believe it unprofitable to rear colts during the busy season should breed their mares to foal in late fall or winter.

HORSE WITH CANKER

I have a horse with canker in one hind foot, and has been going to the vet. more than six months and is no better, but he still works. Could you recommend anything? — A Regular Reader.

Answer.—This disease has been recognized from olden times, and apparently is on the increase. It may be described as a chronic wasting in one sense, diseased growth in another of the horny structures of the frog and sole always showing a tendency to spread. Unfortunately the early symptoms are overlooked. When treatment is most successful there is no lameness, and the farrier and the owner are either ignorant or indifferent to the disease. It is true we know but little as to the causes. The word canker is used in so many descriptive senses. Anything that corrodes, eats away, or sets up irritation is designated by this word, the same term is used for all. The subjects of this disease are usually heavy, dull, lymphatic, and the disease is certainly favored by dirty surroundings; standing for long hours in decomposed litter saturated with excreta and urine, a fault too common with country stables. Keeping feet dry and clean are necessary adjuncts to successful treatment. You start heavily handicapped with six months of the disease extending, and still working. Commerce at once with the conjunction of your farrier. You have an up-hill task, perhaps; do what you will you may only check the disease, not cure it . First have diseased foot soaked for a few hours in a bath of warm water in which 5 per cent. of lysol has been added, then let the farrier cut away all diseased horn. This must be thoroughly done; even around the diseased margins the horn must be sacrificed for at least a quarter of an inch. Spare, of course, all healthy horn. Then a shoe is to be nailed on lightly, well seated out; if much horn has been sacrificed wait. The next object is to apply pressure with wads of tow saturated with suitable dressing—something that will form a scab and check extension of the morbid growth. Five per cent. solutions formalin yield good results (do not let even this dilution come in contact with the bare hands.) The dressing must be renewed daily—ununder the shoe if practicable, provided with a thin removable iron covering—or in a canvas bag. Carefully observe daily if any greasy, cheesy, or yellow matter is forming; if so use knife again, or, perhaps, judicious use of hot iron. After a fortnight's treatment with formalin solution, try dry treatment, dusting on freely diseased surface powdered nitrate of lead, daily covering with dry tow, alternating same in similar manner with calomel every other week, but always have pressure. Internal treatment may aid the external—1 oz. doses of Fowler's solution of arsenic given sprinkled over the last feed at night, continued for a fortnight, intermitted for four or five days and then for another fortnight, is certainly worth trying. Keep poultry out of the stable while administering this arsenic. If possible, keep horse at work, but on your own farm, not on the public road. This is an outline of treatment, which, if carefully carried out (you require to work with an intelligent shoeing smith) and much patience exercised, may be rewarded with success. Keep observation on the present sound hind foot and on the diseased one for a period of six months.

GROWTH OF HORSE'S HAIR

I should be glad of a recipe for growing hair on horse after a bruise. —Anxious.

Answer: Unless the hair follicles have been cut away or destroyed, or true skin lost, the hair will be renewed in due course, while if the injury has been of a character to destroy the hair follicles there is nothing that can be applied that will make hair grow or cause its reproduction. Thus recipes for making the hair grow are of no use, and to pretend to reproduce it is absurd, in fact, there is another name for it, which we leave to your imagination. Sometimes, particularly in the case of broken knees, where there has been only a graze, and the skin has not ben cut away or sloughed during the process of repair, some coloring matter combined with a hair stimulant is often applied to hide the blemish until the hair is renewed, and if yours is a case of this kind you might add some lampblack to an ointment made by mixing one part of mercurial ointment and three parts of lard or lanolin.

PARTIAL PARALYSIS

Can you tell me what might be the matter with my two-year-old colt The vet. said she was sunstruck. He bled her and treated her for some time, but no good results came. She can't walk good, has a wabble to her legs. She had a good appetite, eats and drinks as good as ever, and stays up in flesh. She is running out loose all the time. Tell me what is wrong and how to treat it.—W. H.

This is partial paralysis of the hindquarters, probably a sequel to some stroke. Keep her as quiet as possible in a comfortable box stall. Give her a laxative of one pint raw linseed oil and follow up with a heaped teaspoonful of nux vomica three times daily.

CHRONIC COUGH—LICE

What should you consider the cause of an eight-year-old mare coughing at night and morning? Sometimes there will be an interval of a week between coughing attacks. Her wind is good, appetite good, and apparently she is in good condition.

Will you tell me what to do to destroy vermin on calves.

This is a chronic cough. Give her every morning, two drams solid extract of bella donna, fifteen grains digtalis and twenty grains camphor, with sufficient oil of tar to make plastic roll in tissue paper, and administer as a ball, or mix with a pint of warm water and give as a drench.

Mix one part white hellebore with four parts land plasted and dust well into the hair or wash with a five per cent. solution of one of the coal tar antisetpics in water, clothe and keep warm until thoroughly dry. Repeat treatment every ten days until fresh lice cease to hatch out. It will be wise to disinfect the stable by thoroughly sweeping and dusting, and then scrub thoroughly with a hot five per cent. solution of crude carbolic acid.

POULTRY.

HOW TO PREVENT FALL COLDS

Clean houses and clean range are absolutely necessary to the most favorable development of strong, healthy chicks. Clean the houses often—at least onec a week, and twice a week is better. After each cleaning cover the floor with clean sand, sawdust or loam Spray or whitewash the interior of the houses occasionally as a preventive measure. Watch constantly for red mites around the ends or on the under sides of the roosts. Perhaps the quickest way to find them, if present, is to go into the house with a lantern or flash-light shortly after the birds have gone to roost. This is the time when the mites are mobilizing for action and, if present, they will be crawling over the roosts and supports. If there is a heavy infestation they will be seen on the side and back walls and even on the roof above the birds. A little experience will enable one to detect them day or night by their characteristic and objectionable odor.

If found in the houses rigorous methods should be employed against them immediately. The roosts and all other movable fixtures should be taken out and thoroughly painted with carbolineum, cresol, crude carbolic acid or some other equally caustic preparation. The material should also be applied to the side walls near the roost supports—be sure that there are no crevices in which mites are left harboring. The painting and spraying should be done early in the forenoon so that the danger of injuring the birds from the caustic applications will be minimized.

Clean range conditions can only exist where the range is not over-crowded and where the land is unpolluted by droppings and is free from disease germs. To maintain these conditions the flock should be kept fairly small and the houses should be moved occasionally. If possible avoid growing chickens on the same land year after year. It is much safer to give the small range a rest every other year or one year in three and thus be sure that it is kept in good condition. If conditions absolutely preclude the resting of the range one should at least make sure that some crop is grown on the land every season. Many times it is possible to grow two crops a year on the chicken range. On land that is heavy enough to maintain a heavy grass sod under continuous pasturing by the hens the foregoing rules may, of course, be applied less strictly than where the middle of the season sees the range absolutely bare and devoid of all vegetation.

An important thing to avoid while getting the pullets in shape for maximum egg production is the conditions commonly known as "fall colds." Perhaps the chief cause of colds is crowding chicks in the roosting houses without proper ventilation. Even if no colds result, chickens which are forced to breathe hot, foul air will suffer considerably and will be slower in growing.

An excellent plan for a summer roosting house is simply a frame roofed over to protect the birds from storms and if protection from enemies is necessary, covered with wire netting on the sides. If this is not possible and an ordinary colony house is used it should at least have a generous rear ventilator. If the house is of the shed roof type and twelve feet long the ventilator should be about five or six feet long by fifteen inches high and situated just beneath the plate in the middle of the rear wall of the house.

If it is hinged at the top to swing out there will be no danger of rain driving in. Then, if the roosts are placed one and one-half or two feet below the lower edge of the opening there will be no danger of direct draft on the birds; and with the front of the house open ample ventilation will be secured. The harder the wind may blow the oftener will the air inside the house be changed; but it cannot directly strike the birds.

Fall colds ordinarily appear just as a case of "snuffles" with a slight rattle in the throat. The surest way to detect them is by going among the birds at night. Any bird that is wheezing is then easily located. Furthermore, if the colds are at all advanced, a distinct and characteristic odor will be noticed.

Any birds having colds should be isolated at once in order to prevent spreading the trouble through the entire flock. In many cases no other treatment will be necessary other than removing the cause of the trouble. Perhaps the simplest remedy for colds is potassium permanganate. To use this

Pratts

make up a solution by dissolving two or three tablespoonfuls of the crystals in a pint of water. Each time the drinking vessels are filled, pour enough of this stock solution into the water to color it a deep cherry red.

The permanganate is an oxidizing agent and kills the germs which are discharged by the bird while drinking. Metal drinking vessels should be avoided while permanganate is in use because the resulting chemical action consumes the oxidizing power of the germicide and renders it almost immediately valueless. If the colds are severe, it is well to withhold the drinking water until ten or eleven o'clock. Then the birds, in their eagerness to drink, will plunge their heads well down into the water and thus give themselves a thorough disinfecting.

PICK GEESE WHEN FEATHERS RIPE

With the prevailing high prices paid for good feathers at the present time, the person owning geese can increase his income considerably by the proper saving and care of the feathers. In an endeavor to be of some aid to the amateur goose raiser, I will state some of the things I have learned from experience during the last twenty-five years.

One of the first and most important things the goose raiser must learn is how to tell the correct time to pick his geese. When the geese begin to get smooth looking and the feathers are all of the same length, when they pick themselves and the feathers pull out, or they begin to lose them, it is time to test or try the feathers. Catch one of the geese and pull a few feathers from the breast. If they come out easily and are white or creamy yellow on the tips of the quills, it is time to start picking, but if the flesh end of the feathers show blood they should be left a week or ten days and then tested again.

When the feathers are "ripe" the geese should be placed in a dry, straw-bedded pen, from which they can be easily caught without their getting dirty. When ready to start picking, you should select a place free from any breezes, as the feathers scatter very easily. Lay the goose on its back in your lap, place its head and neck under your left arm, tuck the wings under its back, and grasp the left leg with the left hand, and start picking with the right. Begin between the legs and work backward, taking six to eight feathers at a time, and extracting them with a quick jerk. From the legs backwards pull the feathers towards the tail, while from the legs forward the feathers are jerked towards the head. Pick very little, if any at all, from the back, as these act as a protection against the rain and the hot sun. Do not pick very far up the neck or remove the large puff of feathers that support the wings. A good rule to follow is never to pick too close, for there is danger of losing the geese if you do so.

Geese should never be picked during the laying season or while they are brooding. If they lay up until near midsummer they should be picked only twice, but if they quit rather early they may be picked three times. Young stock should never be picked during the first summer, if one wants them for breeding stock, as it will stunt them to a certain extent, but if the feathers are the main object they may be picked once, but in all cases, whether young or old stock, they should never be picked after the cold, wet weather starts in the fall.

After the feathers are picked they should be put in tight muslin sacks, or more preferably in paper flour sacks, and stored in a cool, dry, well-aired room. The sacks should be tight enough to exclude the moths, and should be placed out of the reach of mice. If not so protected you are liable to find the feathers destroyed when you need them the most.—R. K.

THE LICE PROBLEM IN POULTRY FLOCK

Hens which are troubled with lice are soon devitalized and this lack of vigor soon results in illness which might have been avoided by a strong bird. If a hen once becomes thoroughly infested with lice she seems to lose interest in dusting and then the lice have a better opportunity to thrive. Many strong vigorous birds seems to keep free from lice without any treatment and they do it because they dust frequently.

However, it pays to dust birds with some kind of insect powder or give them the blue ointment treatment. We like the blue ointment the best. Place a small bit of the ointment under the vent and rub it into the skin and then place a dab under each wing and the bird will be protected from lice for several months. Two treatments per year is usually sufficient. The blue ointment can be mixed half-and-half with vaseline. When birds are dusted with insect powder the operation must be repeated in a week or ten days to catch the additional pests that hatch after the first dusting. As the cost of treating for lice largely consists in the time required to catch and treat the birds, it seems as if the blue ointment treatment is by far the most satisfactory.

It is best to treat Leghorns at night as the birds are easily frightened and this causes a reduction in egg records and is also very trying to the kindly disposition of the operation. Sometimes a flock of the heavier birds like Barred Rocks, will be so tame that they can all be caught during the day by occasionally throwing out handfuls of grain to coax them near. The wire crook on the end of a stick is a handy implement with which to catch birds when examining or treating them for lice.

If lice and mites are not kept in subjection the egg yield during the hot months will be reduced materially. Hens preyed on by lice and mites are weakened by the loss of blood. A laying-bred hen should lay regularly during 265 days in a year, the remaining 100 days being required to complete the molt, during which time no hen lays many eggs, unless she is one of the modern 300-eggs-a-year hens, which are becoming more numerous every year.

Where hens have a chance to wallow in fine dust, they are rarely infested by body lice, but if these do appear in a flock two or three dustings with a little fluoride of sodium, Persian insect powder or tobacco dust will destroy them. I prefer the fluoride of sodium to any other kind of insect powder. A little pinch dusted on the neck, back, between the legs and under the wings, while the hen is held head downward by the legs, is effective, and two treatments will free a hen, no matter how badly she is infested.

The little red mites found in poultry houses do not stay on hens during the day. They live in cracks and crevices about the poultry house and under the perches, feeding on the hens during the night. These pests are easily destroyed by spraying the perches and the inside of the poultry house with kerosene. I use a spray pump costing 50 cents, and spray the oil on the inside of the house until it is thoroughly dampened. The perches are taken out of the house and sprayed on every side until the oil runs off them. Two treatments of this kind in a summer usually will keep mites away. Do not let hens become so weakened that they will not lay, when a little attention will free them from the attacks of their insect enemies.—M. P.

TRAPPERS AND HUNTERS
For highest prices ship your RAW FURS direct to
We will send you a FREE SAMPLE of Hallam's Paste Animal Bait

This is an entirely new and much improved form of Animal bait—it is made in a paste form and put up in tubes (like tooth paste).

While possessing all the excellent qualities of the liquid bait it lasts longer and is unexcelled for attracting all flesh eating animals, such as Mink, Fox, Wolf, Lynx, Skunk, etc.

It is easy to carry, economical and handy to use, (simply squeeze out enough for your set each time)—not affected by snow or rain.

You can have a FREE sample for the asking (enough for 2 or 3 sets).

We will also send you Hallam's Trappers and Sportsmens Supply Catalogue, 48 pages, (in English and French) showing traps of all kinds, guns, rifles, ammunition, fish nets, shoepacks etc., at very moderate prices.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to houschold science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

Greetings

MERRY CHRISTMAS, friend! It's the time for cheer.

Business may be business, but CHRISTMAS IS CHRISTMAS!

Don't forget the good-will that the angels sang about the night, out under the stars, on the plains of Judea. Methinks I hear it now, that triumphant song, as it rose louder and yet louder, clear and sweet, until it sent an echo over all the world that is echoing and re-echoing still, to-day.

"And on earth peace, good-will toward men."

"For unto you is born this day in the city of David a Saviour, which is Christ the Lord."

Don't forget the little errand-boy on Christmas Day. Do you know how he lives? Do you know if the Christmas God stops beside his door? Do you know if he is hungry, or cold, or forlorn? It is hard, my friend, to be hungry on Christmas Day.

Don't forget the girl out in the kitchen who, perhaps, cooks the dinner which is to gladden your heart to-day. Has she an old mother or father dependent on her, or is she alone and lonely in her life this year? SOME day you, or yours, may have to face the world alone on Christmas Day. You'll know then the value of the human touch from soul to soul.

Don't forget the Christmas Greeting. It warms the heart and makes the blood flow warmer—quicker—in the veins.

Don't forget the children.

Don't forget the poor—THE SAD—who are just across the way.

Don't forget the invalid—who can't get out like you can.

And as the Yule-tide cheer swings high, don't above all, forget the old folks who are, perhaps, lonely in the old home to-day. They worked hard, with many a denial, that YOU, year after year, might have a joyous Christmas Day.

Friend, business is business, but CHRISTMAS IS CHRISTMAS!

MAKE SOME SOUL GLAD THAT DAY!

"Unto Them a Child"

A CHRISTMAS STORY

Florence Guertin Tuttle

Like the eye of Providence a hospital never sleeps. The Dark Angel does not proclaim his visits, and a life-saving station must ever watch.

John Shepherd found himself waiting in the hospital one early December night under rather unusual circumstances. Like many men able to write their fortunes in seven figures he had built a town house much more impressive than his own needs or tastes prescribed, and had proceeded to close it for two-thirds of the year. On account of the beauty of its architecture this house had become one of the distinguished points of the city. A genuine regret was therefore felt when one morning the papers announced that it had been destroyed by fire. Horror deepened the disaster when it was learned that Mr. and Mrs. Shepherd had barely escaped with their lives.

Many doors were at once opened to the Shepherds by sympathetic friends. But Mrs. Shepherd, acting upon her physician's advice, chose private apartments in the scientifically-equipped city hospital.

Perhaps no one in her set less intentionally or more positively exerted an influence than Madeleine Shepherd. One felt that in spite of her warm humanity here was a woman who was still sustained by the manna of the wilderness; that a life in the vortex of worldiness had never engulfed or even swayed her. In short, she was what one critic had termed " a spiritual genius."

When she married she had committed the dangerous experiment of choosing her complete antithesis in temperament. Not even their great mutual love could have saved their happiness from wreck if John Shepherd had been a less tolerant man. When his wife's ideals soared to heights above him he did not try to stop their flight with the keen arrow of ridicule. He respected her opinions, reverenced her earnestness and secretly agreed with her that the ideal was the only real guide.

They had been married 15 years and had been childless. To Madeleine Shepherd this had been a severe disappointment. The disappointment to John Shepherd had been keen only on its material side. He wished not so much for a child as for an heir. He had never considered adopting one. The law could not give him, he said, what he had not begot.

But now the dear wish of both their hearts was about to be realized. Filled with the deepest emotion and keenest suffering that he had ever known, he sat desolate with bowed head, waiting a summons to go to his wife. He was roused by a tap on his shoulder.

"You may go in to see your wife for a few moments now, Mr. Shepherd," a doctor's voice said.

"She will—live?" his dry lips formed.

"We think so."

"And the child?"

"A fine boy."

The miracle of birth, like the mystery called death, produces analogous sensations. John Shepherd entered the sick-room numb with awe. When he reached the shadowy bed he could only drop on his knees beside it and hide his face in his hands.

"Poor boy!" a faint voice said, while a hand stole slowly toward his head.

Sob after sob choked his throat. She let his over-strained nerves find vent, then said with overwhelming pride, "Aren't you going to look at us? See, it is Christmastide—I have given my lord a son."

He could not trust himself to speak. But he kissed the hand near him and suffered himself to be led away. Then he went out into the night and walked until the first red streaks of dawn declared another day.

The days now passed swiftly toward the Yuletide for happiness sped the dial. John Shepherd was becoming used to the immense thought of parenthood. Night and morning he visited the hospital and many times a day telephoned there, through a telephone he had ordered placed by his wife's side. Her room became a garden where roses and lilies bloomed. When he looked at her he felt almost like shielding his face from her radiance. He had never before seen a being so saturated with happiness, so burnished by the holiness of joy.

A few nights before Christmas he went to the hospital late after a business meeting. As he passed down a long hall he heard voices in a small room adjoining one of the wards—a room set apart for the nurses and where they often made coffee for the young doctors who were on night watch. He caught the tones of a woman's voice, low but penetrating.

"Did you ever see two people so engrossed in a child? How hard for them when they learn the truth!"

"Who will tell them?" a masculine voice inquired.

"Doctor Jameson. He thinks that it will be safe on the fourteenth day; it's only the twelfth day now."

John Shepherd stood still. Of whom were they speaking? His own child was just twelve days old. Something closed around his heart and gripped him. He groped his way into a room used for private operations. One gas-jet burned dimly and cast a wan light on the barren plainness of the room. At one end stood a huge machine looking like a dangerous engine of war, but in reality a sterilizer for basins, instruments and bandages. Glass tables and iron washstands flanked the sides. Everything was painted white and was scrupulously clean. How careful these doctors were in all externals of their profession! Were they capable of secreting an important truth from some one who ought to know it? Some one, for instance, who had a child twelve days old? Were his child's faculties impaired? he asked himself. Was he deaf—blind? His glance read unconsciously the labels on blue bottles of iodine and glass jars filled with saline solutions. Next to these were cans of ether and chloroform. Better their kind oblivion, he thought, than that such a sorrow should come to his wife! For her, motherhood had not begun with birth. He knew that for months her soul had been magnifying the Lord; spiritually and intellectually she had believed that she was forming the character of her child that future generations might call her blessed. But she was not the only mother in the hospital. There must be other children twelve days old. He refused to believe that aught was wrong. But the next morning, after a restless night, he visited Doctor Jameson, the eminent surgeon, and put a direct question to him.

"Is there any fact regarding my son, Doctor Jameson," he asked, "that I should know and do not?"

"There is," the doctor replied unflinchingly; "though we had not meant to tell you so soon."

John Shepherd's eyes narrowed. "What is your justification?" he asked sternly.

"The strongest possible," Doctor Jameson answered; "the preservation of human life."

His earnestness somewhat mollified the tension of his visitor.

"Tell me the facts," he said more gently.

"The facts are, Mr. Shepherd," the doctor began—"the fact is—the child with your wife is not her child!"

"Whose is it?" John Shepherd asked.

"The child of a young woman in the hospital whose husband deserted her. Your child was born dead—a result of the shock of the fire. Your wife was desperately ill. We knew that but one thing could save her. The instinct of self-preservation is strong, but the maternal instinct is stronger. We substituted this child because it was expedient and best."

Expedient! The word rang with a mocking sound in John Shepherd's ears. "Have you doctors no conscience—no appreciation of anguish? Is your profession simply a game?"

Doctor Jameson's eyes flashed though his lips responded to the habitual lesson of self-control.

"You are right, Mr. Shepherd," he answered. "Our profession is a game—a game of life and death. And we play it always to win. We won it for your wife with every chance against

Fainting, Dizzy Spells

Weakness and Shortness of Breath.

Those feelings of faintness, those dizzy spells and "all gone" sinking sensations which come on from time to time indicate a weakened condition of the heart and disordered state of the nerves.

Milburn's Heart and Nerve Pills have no equal for strengthening the heart and invigorating the nerves.

Mrs. C. A. S. Drake, Paris, Ont., writes:—"I have used on towards the second box of Milburn's Heart and Nerve Pills and find they have done me good. I had those fainting, dizzy spells once in a while, and also weakness and shortness of breath, and would become so choked up at times I could hardly sleep without sitting up in bed. When walking too fast I would have to stop and try to catch my breath. I feel a lot better since I have used your pills and know that they have helped me wonderfully as I have improved very much."

Price 50c. a box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

her. She was racked with convulsions and we administered anaesthetics. When she became conscious she asked for her child. In her weakened state the truth would have killed her as if we had struck her a blow. We decided to give her the same chance we would have given the poorest woman in the hospital. We had a two-days-old infant, unwelcome and unloved, whose mother was too ill to be entrusted with it. We placed this child in your wife's arms and your wife revived. That child, and not science, saved her life. It was a necessary temporary deception to secure a permanent benefit."

The storm had passed through the man opposite, leaving him weak and blighted like a tree whose vigor had been swept away.

"You must pardon me," he said wearily, "but I can't seem to take it all in. I seem to see only the moral side. My wife—how can I tell her? She has always said that some pains are more cruel than death."

The doctor moved uneasily.

John Shepherd wiped his brow. "She has taught me to have such a simple creed," he continued: "a thing is right or it is wrong."

"The longer a man lives, Mr. Shepherd, the less he defines the line between right and wrong. He begins to obey 'judge not.'"

John Shepherd rose slowly like an old man. "Perhaps so," he said, languidly. "At least it gives one food for thought; whether a deceitful act may not have a righteous motive."

"But we gave your wife life for death," Doctor Jameson said, nearly losing his patience.

"She would say that you could not take away her life," he returned, moving toward the door.

The doctor shrugged his shoulders almost imperceptibly. "Mrs. Shepherd must be a remarkable woman," he said.

"Remarkable?" his visitor echoed, and his tone gave the physician a glimpse of a relationship which he knew to be rare even between husband and wife.

All day the thought of them haunted his mind. How would such a woman regard the truth? He began to dread the time when she must know. And the netx day Fate put a trump card into his hands.

Doctor Jameson left the hospital at noon, erect, with a holiday air, and walked confidently to his carriage at the curb. In a short time he was driven to the financial centre of the city, and after some delay was admitted to the private office of John Shepherd.

"I have good news for you, Mr. Shepherd," he said with alacrity, noting the hollow eyes which told of a sleepless night. "The mother of the child with your wife died this morning. There is now practically no obstacle to the complete retention of the child as your own."

He spoke with authority as one used to giving advice which was considered cheap even at very high rates.

"My wife must decide," John Shepherd returned. "How soon will it be prudent to tell her?"

"I think that it would better be postponed—definitely," the doctor answered with a significant smile.

John Shepherd shook his head. "I would not live with a lie between us. It would be easier to stab her than to tell her that the little one in her arms is not our own. Yet she would want to know the truth. I feel that we should give up the child. My wife, I am sure, will feel the same."

Doctor Jameson looked perplexed. "Would you rather that I broke it to her?" he asked.

"No, though I thank you for the offer. It would be better, I think, for me to tell her myself."

That night he told her. It was Christmas Eve, on the fourteenth day, just as they had planned from the first.

He never knew in what words he told her. They were alone except for the child whom she could scarcely bear from her side. He remembered taking both her hands tightly and in an overwhelming flood of tenderness somehow stammering out the truth.

He would never forget her eyes. They darkened with unbelief, then gradually he saw hope die. She did not speak, but lay fearfully still. He recognized the futility of words and remained quiet. Then when his own heart could endure the silence no longer he tried to assure her grief with a torrent of broken words.

"It will not be so hard when you realize the little one is not ours. We will live closer than ever to each other. Think—we have every blessing except this one."

She let him go on, knowing that the words brought him relief. But what she most wanted was time to think.

He would not leave her, and she knew that his pain would be less if with her than if away. So she told the nurse that he must remain. All night he sat in an armchair by her side, clasping her hand. At midnight a church bell tolled the glad tidings: "Peace on earth, good will toward men." Once he lifted his head and asked: "Have you had any rest?" But her eyes were wide open as she replied: "No, dear, not yet."

In the morning when Christmas broke she was very pale, but her eyes had the look of one who had been through the fiery furnace and had come out purified.

"All night I wrestled with my soul, John," she said softly. "At first it seemed as if God had deserted me—

Back at His Work in Quebec Woods

William H. McDonald Shouts Praises of Dodd's Kidney Pills

His Troubles Were Not Only Painful but Alarming Till He Found Relief in Dodd's Kidney Pills.

Bury, Que., Dec. 6th. (Special)—William H. McDonald, a young man living near here, is shouting the praises of Dodd's Kidney Pills. Rheumatism in his arms, severe pains in his back and head and an alarming pain in the region of his heart rendered him not only helpless but much alarmed as to the future. He found the relief he needed in one box of Dodd's Kidney Pills.

"I will recommend Dodd's Kidney Pills to anyone with weak kidneys," Mr. McDonald says in telling his story. "I am back at work in the woods feeling as well as ever. What with rheumatism and those pains in the head and near the heart, I was sick and anxious.

"But after a week's illness I tried Dodd's Kidney Pills. One box of them made me as well as ever I was in my life."

Rheumatism is caused by uric acid in the blood. If the kidneys are right they will strain the uric acid out of the blood. Rheumatism is caused by weak kidneys. The natural cure is to make the kidneys strong by using Dodd's Kidney Pills. Ask your neighbors about them.

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

Read My FREE Offer:

To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten days' trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write aud ask for the free treatment to-day, as you may not see this offer again. Address:

there was no 'good will toward men.' But now I know better. He took away my own child, but He placed another one in my arms. It is as if a voice had said: 'Woman, behold thy son!'"

John Shepherd bowed his head. He could bear her suffering better than her fortitude. "He is not your son," he murmured.

"Neither was John the son of Mary," she replied. "That is the lesson—it is easy to love what is one's own. But what if we are called upon to illustrate a larger ideal?—to love what is not our own?"

"How do you know what tendencies this child has inherited?" he argued.

"I have thought of that," she replied; "but environment, I believe, is stronger than heredity. If it were not there would be no hope for the world. That is what this trial means to me: it would not have been difficult to nurture our own son. That is natural. But for a finer development we are required to give as much love and care to what is not our own."

He knew then that she had chosen her course and that the decision came from pathways where he could not follow.

"I shall never have a little one now of my own," she continued, and for the first time tears rolled down her cheeks. "And the reason, I think, is that love for my own child would have been too personal, too individual. I might have become the selfish mother that I have always deplored. True motherhood is inclusive, not exclusive. Do you see now why I want this child to be really ours?"

"You think it our duty?" he answered.

"No, nothing so harsh as that. I think it our privilege. Will you help me to make it our happiness?"

"What do you wish me to do?" he asked huskily.

A light broke over her face. "Give me your other hand," she said. "We three will form a circle that will widen but will never break. Can you repeat the vow that I have taken?"

"Let me hear it."

"I, John Shepherd——"

"I, John Shepherd," he echoed.

"Do solemnly promise to love and cherish this my God-given son."

For a moment the room remained in silence. Then the force of those new vibrations swept him on and involuntarily he repeated her words.

Outside Christmas bells were pealing; "For unto you a Child is born, unto you a Son is given."

As they fell upon the room his wife dropped back on the pillows. He started up thinking that she had fainted. But when she opened her eyes he saw that she had been overcome with joy. As he gazed upon her his own eyes grew dim. He felt the possibilities of life from her larger standpoint and saw what he himself might become.

With this revelation the clouds of the last few days rolled away. Overcome with the new instincts of his risen self he stepped forward, and stretching his arms out toward the child he cried with the first happy ring his voice had known for days: "Give him to me; he was sent to me, too!"

A CHRISTMAS COLLECTION OF CANDIES

There are few people who do not possess a sweet tooth and would not welcome a box of home-made candies. Such gifts are especially appropriate for Christmas because they carry the message of thoughtfulness and regard for personal tastes that only such little rememberances can convey.

In making chocolates with a variety of fillings it is best to make all the centers before coating any with the chocolate.

Six different kinds of fillings are plenty for a half-pound box of the bon bons and eight for a larger size. If you are sure of the recipient's taste a smaller number may be selected.

Butternut Carmel

One of the most delicious fillings is butternut carmel. For this cook together two cupfuls of brown sugar, one-half cupful of water, one cupful of thick corn syrup and a rounding tablespoonful of butter. When a little of the mixture forms a soft ball on being dropped into cold water, remove the candy from the fire and add one-half teaspoonful of vanilla and one cupful of butternut-meats broken into small pieces. Pour into a shallow square buttered pan, and when partly cold mark off into small cubes.

gether two cupfuls of brown sugar, one of white, two tablespoonfuls of unsweetened chocolate shavings and one cupful of water.

Boil until a little of the mixture dropped int ocold water forms a soft ball, then stir in a pinch of soda and remove from the fire. Have ready one-half pound of fresh marshmallows that have been cut into pieces with the scissors and stir them into the candy.

Beat the mixture until it is as stiff as you can handle, then pour it into a shallow buttered pan and cut it into cubes.

Cream Candy

This candy should be made at least a day before being eaten. Put five cupfuls of sugar into a very deep pan and pour one cupful of boiling water over it, then stir until the sugar is dissolved, so that the candy will not have to be stirred while it is boiling.

Cook until at the soft-ball stage, then turn in one cupful of cream and continue boiling until a little of the candy sirup, dropped into cold water, forms a hard ball.

Add one-half teaspoonful of vanilla, pour out into a buttered pan, and when cool enough to handle, pull it as you would taffy.

Divinity Fudge

Cook to a soft-ball stage three and onehalf cupfuls of granulated sugar, two-thirds of a cupful of water and one-half cupful of thick corn syrup.

Beat the whites of two eggs to a stiff froth with a pinch of salt nad pour over them, beating constantly, one-half cupful of the boiling sirup, putting the rest of the sirup back over the blaze to cook until it is at the hard ball stage, pouring over them the rest of the boiling sirup when it has reached the right degree, and adding one one-half cupfuls of English walnut, pecan or butternut meats and one-half teaspoonful of vanilla. Beat unti lthe mass is heavy and thick, then drop in teaspoonfuls on oiled paper.

French Fondant

The foundation for a great many delicious candies is what the French call fondant. Some people make it of white of egg beaten stiff and enough powdered sugar whipped in to make the mass easy to manipulate.

By dividing the fondant into equal parts and flavoring and coloring them differently a great variety of creams can be made. Orange-juice, lemon-juice, extracts of vanilla and almond, and grated cocanut are all good flavors for candies to be dipped into chocolate.

Besides using the fondant alone for centers and for stuffing dates try some pecan or English walnut sandwiches. These are merely bits of the fondant between two whole nut-meats.

A hazel-nut or small pieces of Brazil nuts carefully enclosed in vanilla or almond fondant makes a surprise center that all the children like very much. Canned pineapple, angelica and candied cherries can be used in the same manner.

Marshmallow and Fruit Fillings

Fresh marshmallows cut into quarters by sharp scissors make excellent filling for chocolates. Tangerine and orange sections can also be used if care is taken not to break the thin skin before dipping, and a fork employed with which to lift them in and out of the chocolate.

If these fruit sections become pierced in any way before the coating hardens on them, the juice that escapes so dilutes the chocolate that the candy becomes mussy. Sections that have been successfully removed from the friut can be left to dry on a sieve for a couple of hours before dipping. In this way the thin skin becomes slightly toughened and the fruit is easier to handle. Figs cut into strips and rour or five peanuts held together with carmelized sugar are always easy to prepare and dip.

Chocolate for Dipping

The chocolate for dipping can be prepared by melting a cake of milk chocolate and diluting it with boiling water until of the right consistency, but that is so experimental with most people who undertake to make Christmas candies that it is best to buy the dipping chocolate of a confectioner.

It costs only about fifty cents a pound and a little goes a long way. To use it, melt it in a pan of boiling water. When the chocolate is like thick cream dip the candy ctenr in it, using a long hatpin.

Carefully drain off any surplus chocolate and place the candy on a piece of paraffin paper laid on a chilled surface. Put the dipped chocolate where the chocolate will become very cold as soon as possible.

By doing this the little curly top made by the coating as the pin leaves the candy, and with which all amateurs so greatly desire to mark their products, will be prevented from runing into the rest of the coating.

Keep candies of each kind together so that in filling the boxes a variety may be chosen easily.

Wrapped in white tissue paper and fastened with Christmas or Red Cross seals and enclosed in a plain wrapping, you have a gift that will please any friend, no matter how fastidious he or she may be.

Maple Nut Carmels

1 cupful of maple syrup (6 ounces) ½ cupful dark corn syrup, 1 small can of evaporated milk, 4 teaspoonfuls of butter, 4 teaspoonfuls of Cornstarch. ½ teaspoonful of soda, 1 teaspoonful of vanilla.

Pour the evaporated milk into a measuring cup and fill the cup with water, or with milk, cream or left-over condensed milk. Add the maple sugar, and stir in the corn sirup, butter, cornstarch and soda mixed. If the maple sugar is very hard, put the whole mixture over hot water until it melts. Then boil it until, when tried in cold water, a litte makes a ball that is hard on the outside and "chewy" in the centre. If the mixture separates it will not matter. Stir in quickly chopped nut meats. Add the vanilla, and put into a bread pan, which has been rubbed wth butter. When cold, cut into squares and roll in paraffin paper if desired.

Nut Bristle

Boil one cup sugar, one cup corn syrup, one tablespoonful vinegar and the mass hardens when dropped into cold water. Have nut meats spread on butered platter and cover with the hot syrup. When nearly cold mark into squares.

WHY CHRISTMAS CUSTOMS CAME ABOUT

Why the English Christmas Meat is Beef

When the Druids gathered the mistletoe from the sacred oak each winter, two bulls were sacrificed, and the ancient Britons ate beef as a reminder of the sacrifice. This significance has, of crouse, long since died out, but beef has always been the Christmas meat of the English. The loin of beef was knighted by Charles II. at a Christmas feast, because on returning from the hunt the dish was so gratifying to his palate.

Quote Charles,—

"Odd's fish! A noble dish!
Ay, noble made by me!
By kingly right I dub thee knight—
Sir Loin henceforward be."

Why We Eat Plum Pudding and Mince Pie

The Christmas pudding in its contents is thought to symbolize, as does mince pie also, the rich offerings made by the Wise Men to the Infant Christ, and dates back to the early Christians.

"Once upon a time" plum pudding was called "hackin" signifying the "hackin" or chopping of the ingredients—meat suet, fruits and spices. After the revolution that enthroned the "Merry Monarch" Charles II., the "Hackin" of our ancestors was baptized "Plum Pudding."

It seems to have survived in its original form only in England, where it is a National dish. It was brought to America by the English colonists.

It is said that a Frenchman will not taste thereof. There is a funny story that a French nobleman, wishing to please an English Ambassador on Christmas Day by serving a plum pudding, procured a recipe and gave his chef minutest instruction as to the in-

That Racking Persistent Cough

Should Never Be Neglected.

The constant hacking, racking, persistent cough that sticks to you in spite of everything you have done to get rid of it, means danger.

The longer the cough sticks, the more serious menace it becomes to your health.

It is a very easy matter to get rid of the cold at the outset by using

Dr. Wood's

Norway Pine Syrup.

In nearly every case it will allay the inflammation, soothe the irritation, heal the diseased mucous lining of the lungs and bronchial tubes, and thus rid the system of all the bad effects of the lingering cough or cold.

Dr. Wood's Norway Pine Syrup has been universally used for the past 30 years, and so great has been its success, it is only natural that a great many imitations have been placed on the market.

Don't accept any of these, so-called Pine Syrups. Get the original "Dr. Wood's."

Put up in a yellow wrapper; 3 pine trees the trade mark; price 25c. and 50c.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

gredients, the quantity of water in the kettle, etc., forgetting only one thing, the pudding cloth, and the dish was served up like so much soup, in a large tureen, to the surprise of the honored guest.

Where We Get the Christmas Card

Christmas cards were first printed in London nearly seventy years ago, but did not become popular until fifty years ago. The first Christmas card was only a visiting card on which was written the greeting, "A Merry Christmas" or a "Happy New Year." Snow scenes, holly branches and robins appeared later on embossed cards, probably picturing English Christmas scenery, as the robin is known in England as the Christmas bird, and also as "The Saviour's bird" because of the legend of its red breast. This bird is still seen on Christmas, but not as often as formerly.

What is Twelfth Night.

January 6th, the twelfth night after Christmas, is the celebration of the visit of the Magi to the Infant King in the Bthlehem manger, known in the church calendar as Epiphany. Its traditions and observances have become corrupted, but as Christmas customs trace to the Roman Saturnalia so do those of the Twelfth Night Frolics. The King of Saturnalia was elected by beans, and the one who gets the bean in the twelfth cake which is divided by lot, is the King, or "Lord of Misrule." He holds a mock court and receives the homage of the other guests, for whom later in the evening he suggests amusing diversions. The street revelries are much on the order of the American April first and Hallowe'en frolics.

The religious rites are still observed in some form. In memory of the Magi's offereings, the British Sovereign each year places by proxy three purses on the alms dish for presentation on the altar.

Why Do We Present Gifts?

It was the custom among the Romans to make gifts to each other at their winter festival and this custom also may have descended to us from antiquity. But Christians lipe to feel that it is because the Wise Men brought gifts to the Infant Jesus, and because of the gift of God to the world. Gifts to the poor seem from the earliest Bible times to have been an expression of a thankful heart. We bring Him gifts when we give to those who are in need.

Why We Decorate the Christmas Tree

The ancient Teutons, who were sun-worshippers, thought that the spreading of a great tree was symbolical of the sun rising higher and higher in the heavens, and the decorations of our Christmas trees is supposed to be symbolic of the Sun tree. The lights represent the flashes of lightning overhead, the apples, nuts and balls symbolize the sun, moon and stars, while the little animals represent the sacrifices made to the Sun god.

In another endeavor to give a new meaning to heathenish customs the early Christians put a new interpretation upon the tree itself and attached new meanings to its decorations. The fir itself, with its lights, represented the Christ, who was the beginning of a new life in the midst of the wintry darkness of heathendom, the tree of life, the light of the world. "Purely Christian symbols were introduced, the angels, the anchor, cross and hear, the star of the east and the golden threads, called Lametta, which represent the hair of the Christ child. Under the branches of the tree lies the Babe in a manger, watchd over by His parents and surrounded by sheep and oxen."

Our Christmas Colors

For hundreds of years holly has been used for Christmas decoration. It grows in almost every country. The choice of our Christmas colors, red and green, has no doubt come about from these colors which nature provides at the Christmas season in the holly and poinsetta.

Why Do We Kiss Under the Mistltoe?

Romantic Scandinavians, in paying honor to their great god, Thor, built rgeat fires called "Jule" or "Yule" fires. The higher the flames towered through the forests the greater pleased was Thor. The men soon learned that the tree upon which mistletoe clung would give the brightest fires. They believd this was due to the great Thor himself, who caused the mistletoe to grow on those trees to let his people know which were best for burning in his honor.

The trees upon which quantities of the mistletoe grew were sapped of their vitality, and being drier, burned with a brighter flame than other trees that were full of sap. So when any one met under the mistletoe in the great forests, no matter how great enemies they were, they dropped their wapons and greeted each other kindly nor would thy take up arms against each other until the sunrise of another day. This was their tribute in honor of Thor.

They ebgan to take bits of the mistletoe into their homes and hang it over the doorways, and if any enemies came they could not enter their home beneath the mistleto without becoming friends of the people inside so long as they remained there. From this came the habit of greeting people who stopped under the mistletoe with an embrace or a kiss ,and at indoor

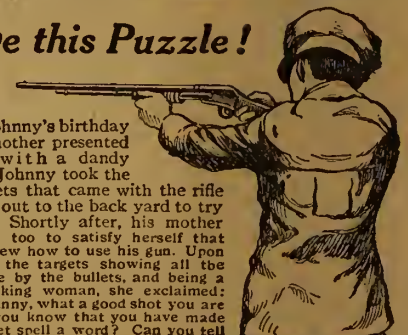
Something We All Do
Something We All Eat
Something We All Want
Something We All Wear

Solve this Puzzle!



FOR Johnny's birthday his mother presented him with a dandy rifle, and Johnny took the four targets that came with the rifle and went out to the back yard to try his skill. Shortly after, his mother came out too to satisfy herself that Johnny knew how to use his gun. Upon examining the targets showing all the holes made by the bullets, and being a quick-thinking woman, she exclaimed: "Why, Johnny, what a good shot you are—and do you know that you have made every target spell a word? Can you tell me what each target spells?"

Can YOU Puzzle It Out?

Johnny couldn't, so his mother told him HOW TO DO IT. Each target spells a word. Each circle of each target shows a number of bullet holes, as you can see by the targets, and each circle represents a letter. The number of holes indicates the position of that letter in the alphabet. For instance: "A" would be represented by one hole, "B" by two holes, "C" by three holes, and so on.

After you have worked out all the letters that are represented in each word, you will find that they are not in their proper order. Put them into their proper order to spell out correctly the names of the four things wanted.

In order to help you, we will tell you that the letter represented by the middle circle of first target is "A," because "A" is the first letter of the alphabet. This is not an easy puzzle, hut with perseverance you can work it out—and the prizes are worth trying for.

Copy your answer upon a plain white sheet of paper as neatly as you can, because neatness, spelling, handwriting and punctuation count if more than one answer is correct. Put your name and address in the top right-hand corner of the paper. If you have to write a letter, or show anything else, put it upon a separate sheet of paper. We will write as soon as your answer is received and tell you if your solution is correct, and also send you a complete illustrated list of the grand prizes that you can win.

THE PRIZES:

First Prize - Genuine Culver Chummy Racer, value	$250.00
Second Prize - Magnificent Gold Watch and Chain, or Girl's Wrist Watch, value	25.00
Third Prize - Genuine Autographic Kodak Folding Camera, value	20.00
Fourth Prize - Solid Gold Ring for Boy or Girl, value	15.00
Fifth Prize - - Moving Picture Machine, with Film, value	10.00
Sixth to Tenth Prize - Self-Filler Fountain Pens, value, each	2.50

And 2,000 Extra Special Prizes Valued at $3,000.00.

What Others Have Done, YOU Can Do!

Here are the names of only a few of the boys and girls to whom we have already awarded big prizes:
Shetland Pony and Cart—Helen Smith, Edmonton.
Shetland Pony—Beatrice Hughes, Hazenmore, Sask.
$100.00 Cash—Lyle Benson, Hamilton, Ont.
$50.00 Cash—Helen Benesch, Junkins, Alta.
$25.00 Cash—Florence Nesbitt, Arnprior, Ont.
$150.00 Cash—Bryden Foster, Leamington, Ont.
$25.00 Eastman Kodak—Frankie Kirby, Three Hills, Alta.
$15.00 Bracelet Watch—Mary Procter, Vancouver, B.C.
$10.00 Doll and Carriage—Eva Gasson, North Bay, Ont.

We will send you the names of many others too. Only boys and girls under 17 years of age may send answers, and each boy and girl will be required to perform a small service for us.
The contest will close on June 30, 1920, at 5.30 p.m.
Send your answers this very evening.

Address: THE PRIZEMAN, Dept. 514
253-259 Spadina Avenue, Toronto, Ont.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.
Address

MRS. M. SUMMERS, Box 309

feasts, the mistleto was hung up in the room and people greeted each other with kisses. And, so in these days, the couple kissing beneath the Christmas mistletoe in a spirit of fun or romance, carries on a custom the Scandinavians had a thousand years before Christ.

What the Christmas Candle Signifies

Burning candles at Christmastide is derived from the Roman Saturnalia. Not only were candles used for the purpose of illumination during that festival, but they were also exchanged as gifts in token of cheerfulness and good will. It is probable that the employment of candles was derived from the Jewish Feast of the Dedication, which was held about the same time of the year as the Saturnalia and the Yule. The burning of candles was one of the incidents of that feast, and it is not unlikely that at the time of the birth of Christ thousands of candles were brightly burning throughout Palestine—a fitting, though unintentional, proclamation of the Light that had come into the world. A fact that bears out this supposition is that the Catholics of the Greek Church call Christmas the "Feast of Lights."

THE TRUE MEANING OF CHRISTMAS

Giving is getting!

That is the blessed contradiction. Two thousand years ago it began when a Man came to earth who had ni gift to bestow save Himself. Be He gave His all, full measure, pressed down and running over.

In return He asked nothing!

Yet for two thousand years we have celebrated His birthday by gving, as He did, a gift to the ones we love.

His gift that first Christmas signified boundless love. Do your gifts today?

There is a magic mirror in which to inspect your gifts. It is called the Mirror of Love. It tells an unpleasant story when you hold up before it a present which is merely the cancelling of a debt. A pair of braclets set with priceless jewels viewed in Love's Mirror have been revealed as a pair of hateful handcuffs.

A little frame whittled out of a bit of wood by a small boy for his mother, shows in the Magic Mirror the most ornate covering, inlaid with precious wood, fragrant and beautiful beyond compare.

When, even a book of shaving-paper made by a little girl for her father appears to be a precious edition de luxe.

That is tho strange magic of Love's Mirror.

A Chrstmas card reflected in this mirror—just a plain penny postal card with a loving thought and a merry wish upon it—is more attractive than the work of an old master.

Even the candles and puddings and cakes and confections, the apples and oranges, shine with astounding splendor at the Christmas feast where Love is honored guest.

Christmas is the season when the heart takes possession. It is the time when the self-conscious person becomes demonstrative without a feeling of shame; when the person who is all intellct fels strange, warm stirrings in his breast; when the affectionate person becomes a perfect spendthrift of love.

The heart takes you shopping and carries the purse. The heart keeps you up nights sewing on bright ribbons. The heart spurs you on to all sorts of extravagance.

It has the most wonderful memory. People whom you haven't thought of in years come to your mind and with the memory, the desire to make them happy.

Up and down the streets stalks the Spirit of Christmas, the breath of pine and cedar in its wake. How rich you are! How loving you are! How happy you are!

Giving is getting, you see.

But what about the rest of the year? Does the spirit of Christmas walk besid you down the avenue of three hundred and sixty-five days? Perhaps you are one of those who bid it goodby with a sigh of relief on December the twnty-sixth. If you do, you've missed entirely the significance of the Star, the Shepherds, the Wise Men and the Babe in the Manger.

The Master gave Himslf. For thirty-three years, day and day out, He spent his life in the service of others.

Has that no meaning

Look at yourself in Love's Magic Mirror. I pray that you see your soul there glorified wth giving.

All through the year there the people who are lonely. Perhaps they are sitting back of the door waiting for a friendly rap. Their children are far away and they have only memories to cheer them. How they would love to talk it all over with you, especially if you are young and have cheery ideas. Will you give a bit of yourself to them during the coming weeks?

In the hospitals, in the almhouses, in the penitentiaries there are people who need the gift of you. They need your hearty hand-grasp, your smile, the loving calence of your voice, as you say, "I wish you a Merry Christmas, not just today, but all through the year."

Even to the blind your message will be a boon, for they can see the light in your eye with their inner vision.

But most of all the gift of yourself will help the people that you meet every day: the members of your family, the grocer's boy that comes to the back door, the gate-keeper's child down by the railroad. A smile, a little treat of home-made candy, the lending fo a ready ear to the story of thir joys and woes, will be worth far more than the costliest Christmas present.

At Christmas-time you are kin to everybody. Carry that kinship through the year.

"What About This Nerve Food Doctor?"

"IT IS all right."

"Would it do for me to take it?"

"I cannot see any objection."

"Well, I know so many women who are using it to good advantage that I decided to give it a trial."

"Then why ask me about it?"

"Just because you know my condition, and I felt that I would like your opinion."

"Of course, you know that we doctors are supposed to be prejudiced against all package medicines. As a matter of fact, nearly all the best medicines on the market are the prescription of doctors and first made their merits known in some doctor's private practice.

"There is scarcely a day but I see Dr. Chase's Nerve Food in the homes I visit, and to be perfectly candid I know of many instances in which this treatment has brought about really remarkable cures."

"Then you thnk it suits my case?"

"Undoubtedly. Your blood is thin and watery. You are anaemic. The nerve cells are starved. Hence the neuralgic pains, the nervousness and irritability, the sleeplessness. The medicine I gave you does not seem to be exactly what you need. The Nerve Food may be just what is required to get your blood and nerves in good condition."

"One thing certain, doctor, it has been a wonderful benefit to several people I know."

"If the conditions are similar in your case there can be no better proof that it will benefit you. After all it is cure we are after, and while every doctor has his own favorite prescriptions, it is results that count."

"Thank you, doctor, I am glad to have your approval and I am going to start in with Dr. Chase's Nerve Food with the determination to give it a good honest trial."

"Good, that is what our medicines do not always get. I would suggest that you follow up this treatment for at least a month or two, and then you will be in a position to know just what benefit you are obtaining. For it takes a little time and patience to restore an exhausted, nervous system."

Dr. Chase's Nerve Food, 50 cents a box, 6 for $2.75, all dealers, or Edmanson, Bates & Co., Limited, Toronto. Every box of the genuine bears the portrait and signature of A. W. Chase, M.D., the famous Receipt Book author.

FIRST ANNUAL CONVENTION AND DAIRY SHOW OF THE N. B. D. U.

(Continued from page 160)

Butter Makers' Session

The Thursday morning session was devoted to an address on the aims and objects of the Canadian National Dairy Council by D'Arcy Scott, Ottawa. The Council, although recently organized, has already done a lot of good work for the dairymen of Canada. Funds are needed to carry on the work so well begun, and every patron and others interested should see to it that the Council does not lack in this respect.

Geo. Barr and W. A. McKay reported on the conditions they had found in the butter exhibits. The showing made was quite gratifying.

One of the most instructive features of the session was the talk by Mr. Barr on the Dominion Educational Butter Scoring Contest. Mr. Barr had brought with him for demonstration purposes, boxes of butter from every province in the Dominion. Samples were passed around and discussions of value to every butter maker ensued.

The Business Session

Mr. Coleman read a report of the committee appointed at a previous meeting to look into the matter of a Maritime Dairy School.

The Treasurers' report showed receipts amounting to $380.05, expenditures $154.74, and a cash balance on hand of $22530. out of which prizes amounting to $120.00 and balance due National Dairy Council of $100.00 must be paid when the actual balance on the years work will be $5.30. There are supplies on hand valued at $16.35.

The election of officers resulted as follows:

President—A. E. Trites, Salisbury.

Vice Pres.—F. G. Hughson, Corn hill.

Secretary Treas.—H. W. Coleman, Sussex.

Auditor—F. H. Rouse, Corn Hill.

Directors representing cheese factory patrons—F. H. Rouse, Corn Hill; W. W. Biggar, Carsonville.

Creamery patrons—J. L. Blakeney, Wheaton Mills and A. E. Trites, Salisbury.

Cheese makers—J. H. Brown, Corn Hill.

Butter makers—J. P. Simmons, Moncton.

Private Cheese factories—Ben Keith, Havelock.

Joint Stock Cheese factories—F. G. Hughson, Corn Hill.

Private Creameries—Geo. Ranson, Woodstock.

Joint Stock Creameries—Arthur Gaudet, St. Joseph.

Resolutions

Whereas the New Brunswick Dairymen United recognize the need and value of a Dominion-wide organization embracing all branches of the dairy industry such as outlined by Mr. D'Arcy Scott, Secretary of the National Dairy Council.

Therefore, resolved that our provincial organization take steps to raise funds to help the National Dairy Council to carry on its work.

Whereas, the marketing of dairy products in an efficient manner is of paramount importance to the Dairy industry.

Therefore, resolved that the New Brunswick Dairymen United hereby express their approval of the system of market information instituted by the Dairy Commissioner for Canada during the season of 1919. We trust that this system will be a permanent feature of the Dairy Commissioner's work.

Whereas, the adoption of a uniform standard for Canadian Creamery Butter is desirable and in the best interests of the Dairy industry.

Therefore resolved that this Convention express appreciation and approval of the Dominion Educational Butter Scoring Contest as conducted during the season 1919 by the Dairy Division, Ottawa, and that the Provincial Department of Agriculture be hereby requested to co-operate in every possible and practical manner in assisting to bring the information resulting from this contest before the butter makers, creamery owners and patrons of the Provinec of New Brunswick.

Whereas the success of our Dairy Convention has been in a measure attributable to the support and sympathy given by the dealers, supply houses and general public, the Dairy Superintendent is hereby instructed to express the appreciation of the New Brunswick Dairymen United to all those who have contributed to the Prize List and to those who have assisted in scoring of the cheese and butter, and to all those who have taken part in any way in the programme at the several sessions of the Convention.

THE DAIRY SHOW

Twenty factories were represented at the Dairy Show with a sample box of June, July, August, September and September special cheese. A full list of the scores and awards will be found tabudatel on another page of this issue. The boxes in question were taken by Mr. Coleman out of the regular make on a certain day each month from each factory without any previous intimation being given as to what day's make he might call for. The maker therefore had no chance to make up a special cheese. He must exercise the best of care every day lest he be caught napping and the result has been most gratifying. The September special class was chosen by the maker from any day's output between the 10th and 20 of September. The cheese was placed in cold storage and held for the Dairy Show when the scoring already referred to was made by Mr. Barr, Mr. Coleman and Mr. McKay.

How the Cheese Graded

	June	July	Aug.	Sept.
Special	0	1	1	1
First	4		2	3
Second	6	9	6	5

Prize List, Cheese Class

Sections I.—June, cheese. II.—July, cheese. III.—August, cheese. Iv.—September, cheese.

() In each of above sections $15.00 pro rata to makers whose cheese score 99 points or over with 39 or over for flavor (N. B. D. U. funds.)

(b) In each of above sections $12.50 pro rata among the eligible factories whose cheese score 90 points or over with 39 points for flavor (Provincial funds.)

Section V.—Highest average score in Sections 1, 2, 3 and 4.

(a) Maker $10.00 — DeLaval Co., Montreal, (value on goods in catalog purchased during the season of 1920.

(b) Fatcory $15.00—DeLaval Co., Montreal, (value on goods in catalog purchased during the season of 1920.

Section V.—September cheese(special.)

(a) $25.00 among makers whose cheese score 92 points or over with 39 points or oevr for flavor (Canadian Salt Co., Windsor, nOt.)

Section VII.—(a) $5.00 for each section 1, 2, 3, and 4 among all makers whose cheese score full for finish. Total, $20.00. (R. B. Colwell, Halifax, N. S.,)

(b) $5.00 for each section, 1, 2, 3 and 4 among all eligible factories whose cheese score full for finish. Total $20.00 (Harris Abbatoir, St. John.,)

Section VIII.—$10.00 for theh ighest scoring in cheese in Section 1, 2, 3, and 4. $5.00 for maker and $5.00 for factory. Maritime Farmer, Sussex.)

Prize List, Butter Class

Sections—1. June butter; II. July butter; III. Aug. butter; IV. Sept. butter.

There is money for You in the Woodlot

Cletrac TANK-TYPE TRACTOR Will take out your wood & saw it up

Cletrac power is never "tied up"—never idle.

It works for you every month in the year.

For one reason, there is no waste time lining up the Cletrac for belt work. No trouble keeping it "set."

For another, you can put the Cletrac over any kind of ground—mud, sand or snow. It travels on its own tracks. So you can have power *anywhere* you want it on the farm—for any machine.

You can take the Cletrac into the bush and snake out logs. The Cletrac will turn them into cordwood.

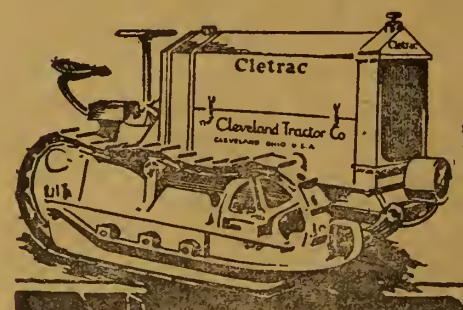
The Cletrac burns kerosene, distillate or gasoline. Fuel is regulated to burn less for light machines.

The Cletrac you must know as the tractor that does every field operation without packing the soil. Its economy, its efficiency have made farming more profitable.

Winter or summer, every month, a Cletrac means more profit from your farm.

From Burpee's Seed Farms:

"One of the great advantages we found in the Cletrac was the great convenience in turning and backing into place for a hitch to the machine to be used and lining up into exact position for belt work."



"Selecting YOUR Tractor"
FREE Booklet of Information

You can decide better what type of tractor YOUR farm needs after you read this book. Find out what a tractor can do for you. Write for this booklet.

THE MARITIME WINTER FAIR

TO BE HELD AT

AMHERST

ON

Mon., Tues., Wed. & Thurs, Dec. 15th, 16th, 17th & 18th

Promises to excell all previous records. Return tickets can be obtained on all lines of Railway for one and one-third first class fare.

Don't fail to see the Big Fair

Watch Your Stock--- IT PAYS !

THE condition of your stock depends—not on how much food you give them—but on the amount of nutriment they are able to extract from that food.

If you have some stock—a horse, a batch of hogs or a cow or two that are are not thriving or showing the benefit of their feed, are out-of-condition and unthrifty, the use of International Stock Food Tonic, as directed, for a few weeks will show a remarkable change.

INTERNATIONAL STOCK FOOD TONIC

has proved itself to be just what stock needs to put them into a thrifty, healthy condition and keep them that way. It costs little—3 feeds for 1 cent—it does much—keeps your stock in paying condition.

For Horses---

When your horses become unthrifty, sluggish in appearance, rough, hide-bound, coats dry and dead, stocked in limbs—it's time to give them International Stock Food Tonic. This Tonic will enable the animals to throw off these ailments quickly by setting digestive organs in proper shape and helping them to supply rich, red blood.

For Cows---

For the every-day feeding of dairy cows and to fatten cattle, International Stock Food Tonic is rated as the one and only preparation. It is composed of the best-known ingredients to promote perfect digestion and to assist the body organs to perform that perfect assimilation which is the secret of milk-making and fattening. By feeding International, you can increase the quantity of milk and keep your cows in a toned-up, healthy condition.

For Hogs---

International Stock Food Tonic is composed of the valuable properties of herbs, roots, minerals and other digestion promoting ingredients. It gives the hogs a keen appetite and keeps them from going on their feed. Guaranteed to keep their system free from worms and prevent worm development. International Stock Food Tonic keeps the system toned up and in a clean, healthy condition. It will save you thirty days in preparing hogs for the market.

Use International Stock Food Tonic ! It Pays ! Remember the cost is small ! 3 feeds for 1 cent !

For sale by dealers everywhere in convenient-sized packages and in 25 pound pails at $3.75 each.

FREE ON REQUEST

Write us, stating the number of stock you own, and we will send you free of charge a copy of our 1920 Almanac which also contains a series of Breeders' Tables arranged in simple form which enables you to keep accurate track of all your breeding stock.

HINTS FOR MOTORISTS

by ALBERT L. CLOUGH

Editor Motor Service Bureau Review of Reviews...

WHY CARBURETORS SOMETIMES NEED ADJUSTMENT

Don't Hesitate To Reset a Carburetor If You Know How

The advice is frequently given: "Do not tamper with the carburetor, as it has been correctly adjusted at the factory," and doubtless this admonition is intended in the very best spirit, for it is a fact that, when once propertly set, a carburetor will go on performing satisfactorily as long as conditions do not change, so that altering its adjustments unintelligently or needlessly will do more harm than good. The reason why this advice should not be literally followed is that carburetor and carburation conditions are subject to change and it is foolish to assert that a factory adjustment ca nbe either infallibly perfect or prove permanently right. Among the factors that make carburetor adjustment occasionally necessary are the following: Changes of gasoline quality ,involving diereffnces in its viscosity or 'body", that alter the rate of fuel flow through the fuel spraying nozzle. The "heavier" the gasoline used, the less will pass through a certain aperture, under a certain pressure. Changes in atmospheric density, as between low and high altitudes, less oxygen being contained in a cubic foot of air at a high elevation than, for instance, sea level. The same adjjustment that is correct at Denver will not necessarily be so at New York. Change in the action of carburetor parts with time, due to the weakening of springs controlling the air supply and the alteration through wear, of links that interconnect different portions of the mechanism. Changes in the operative temperature of the intake system and cylined walls, as between the extremesof summer and of winter weather. When no means are taken to overcome the effects of such atmospheric differences, a more liberal gasoline adjustment must be maintained in cold weather ,because so much of the fuel supplied fails to vaporize and burn properly. Differences in the carburation requirements sought. Some operator wish a mixture rich enough to produce maximum acceleration and power, even at some sacrifice in economy while others, in order to save gasoline, are willing to use a slightly leaner mitxure. A motorist should avoid changing his carburetor setting, unless it is known to require it but should not hesitate to do so when it is advisable. Instruction, minutely explaining the correct method of adjustment, are obtainable from the manufacturer of every make of carburetor and ever ymotorist should familiarize himself with the directions applicable to his particular instrument.

"GETTING UP" ON MOTOR CAR TECHNIQUE

Not To Be Personal. Have You Read Your Instruction Book?

This service receives many requests to recommend motor car books and other sources of automobile information, from those who wish ta increase their knowledge of the subject and relative to such inquiries the following hints may not be amiss. There are a number of publishing houses that make a specialty of automotive works and circulate catalogs, which list such literature. The local bookdealed is likely to have such catalogs on file, or, if not, will send for them, so that the motorist may look them over and select works covering the particular phaes of the subject in which he is interested . Public libraries, especially those in larger communities, are generally well stocked with motor car books and periodicals and such local facilities may well be fully made use of before buying books, in order that unnecessary or ill advised purchases may be avoided. As a rule automobile periodilcals contain departments devoted to the motor car users interests and the wealth of useful information printed therein is, in general rather more up to date than that

Palmer's Draw String Shoe Packs

JUST the pack for all men engaged in all out-door occupations. Being waterproof and warm, there is nothing better on the market for Farmers, Lumbermen, Sportsmen, Laborers, Stablemen and others.

found in books. Information regarding automotive electrical equipment is naturally very eagerly sought at the present time and "motorists' Departments" in the technical journals are well filled with such matter, while books and diagrams of electrical systems are to had from a number of different publishers. Automobile instruction books are probably the most helpful of all printed matter relating to cars. Their careful study "is a fine habit."

GARAGING CAR IN HORSE STABLE

M. P. asks: Does it do any harm to a car to keep it in a stable where horses are kept?

Answer: It is not good for fine body finish to keep a car in such surroundings, as the lustre of the varnish is quickly dimmed by the ammonia gas ,which is always present in the air. If the stable is well ventilated

and all sources of ammonia are kept removed, the effect may not prove serious but, if the place is not airy and kept clean, you will find the results not at all satisfactory.

WATER FOR FILLING BATTERIES

T. O. C. asks: Is snow, melted in glass, or in rain water caught in glass and kept in tightly corked glass jars, suitable for filling storage batteries? Is it necessary to collect fresh rain water, each time the battery requires filling, or will it keep from one time to another?

Answer: Yes, if freshly fallen snow only is used and the rain water is collected only after rain has been falling for some time and the roofs have been washed clean. In order

to avoid traces of metal, water that has been in contact with tin roofs or metal gutters should be avoided, the drip from slate, tile or shingle roofs being preferred and it is well to run all natural water through filler paper before bottling it, in order to strain out solid patricles. Water thus prepared and protected from the air will keep in good condition for a long time.

SEASONABLE VARIATION OF TIRE TROUBLE

..N. H. asks: Please explain why there is so much more tire trouble in summer than in winter.

Answer: High speed, long distance driving is more common in summer than in winter and speeding is the most prolific cause of tire failures. The average daily mileage is greater in summer than in winter and tire troubles occur closer together, in point of time, even if no closer together in point of mileage. Cemented repairs are likely not to hold in hot weather, while they are comparatively reliable in cold weather. Doubtless snow and ice cover many sharp objects which, if exposed, might cause punctures. Many cars are not used in the winter, but their tires deteriorate during that season, and finally give out during the summer driving season.

CLUTCH ACTION IS WEAK

T. McE. writes: Occasionally when climbing a very hard hill, on high gear, my clutch begins to slip and continues to do so for some time. This seems to be growing more frequent lately. Will it do an yharm?

Answer: Yes, it will finally ruin

the surfaces of your clutch, whatever kind it may be. When slipping commences you should at once shift into second speed on which no slipping will probably occur. You should at once ascertain what causes this slipping and eliminate it. In sufficient spring pressure, ill advised lubrication or other faulty condition of the frictional surfaces may be causing the slipping.

PILLS FOR THE GAS TANK

L. H. C. asks: Do you consider the tablets sold to be put into the gasoline for the purpose of lessening carbon and increasing mileage are of any benefit? When I tried them I could see no effect from them.

Answer: We never have received any reports which indicated that they were of substantial value nor have we been able to see why they should be. Other motorists have had experiences similar to yours. Very few operators are willing to persist in this "pill" treatment for any considerable length of time. Using the leanest practicable mixture and oil of good quality and keep your pistons tight, will do more to increase fuel efficiency and to check carbonization than any kind of "dope" treatment.

FIRST ANNUAL CONVENTION AND DAIRY SHOW OF THE N. B. D. U.

(Continued from page 180)

$15.00 pro rata among eligible makers whose butter scores 20 points or over with 39 points or over for flavor. (N. B .D. U. Funds).

(b) In each of above sections $12.50 pro rata among eligible creameries whose butter scores 90 points or over with 39 points or over for flavor. (Provincial funds.)

Section V.—For the higest average score in Sections 1, 2, 3 and 4.

(a) $10.00 for the maker (DeLaval Co., Montreal, value on goods purchased during season of 1920.)

$15.00 for creamery (DeLaval Co., Montreal, (value on goods purchased during season of 1920.)

Section VI.—(a) $5.00 for each Section 1, 2, 3 and 4 among all eligible makers whose butter scores "first grade" (92-94 flavor 39 Points). Total $20.00 Gunns Ltd., St. John.

(b) $5.00 for each section 1, 2, 3 and 4 among all eligible creameries whose butter scores "first grade" (92-94 flavor 39 points. Canadian Salt Co. Windsor, Ontario.

Section VIII.—(a) $5.00 to maker having the highest scoring box of butter in Sections 1, 2, 3 and 4, Gunns Ltd., St. John.

(b) $5.00 to the eligible creamery having the highest score for flavor in Sections 1, 2, 3 and 4. Canadian Salt Co.

Section VIII.—Silver ware for the three highest scoring boxes of butter in Sections 1, 2, 3, 4. Diamond Crystal Salt Co., St. Clair, Mich.

There were ten contestants in the butter sections. The butter on exhibition consisted of a box from each factory. June, July, August and September made.

Mr. Coleman on a certain date, notified each maker to ship to the Cold Storage Company, St. John, a box of butter make from the cream then in the creamery. The maker received no previous notice, and consequently vigilance had to be exercised every day lest he be taken unawars.

Cheese—Special Prizes

$20.00, donated by R B Colwell to makers having full score for finish in Section 1, 2, 3 and 4.

MARITIME WINTER FAIR

Amherst, Dec. 2.—The Maritime Stock Breeders Association have been working hard to make this year's Winter Fair eclipse all previous efforts along that line. Their efforts are meeting with encouragement. This morning Mr. F. L. Fuller, Secretary of the Association received letters of acceptance, to be present and participate in the Fair, from Mr. H. S. Arkell, Live Stock Commissioner, Ottawa, Prof. George E. Day, Secretary of the Canadian Short Horn Breeders Association, Guelph and several other prominent stock men.

Hon. Murdoch McKinnon, Lieutenant Governor of Prince Edward Island, has consented to be present and to officially open the Fair at eight o'clock Monday evening, December 15. The opening will also be participated in by Hon. Dr. S. F. Tolmie, Minister of Agriculture and Prof. E. S. Archibald, Director of Experimental Farms Ottawa, who will be present thoroughout the Fair.

The attendance of these nationally eminent specialists in stock breeding and raising will make the Fair one of rare value to Maritime breeders, who according to present prospects will attend in greater numbers than ever. Special housing arrangements are being made so that all can be properly cared for.

WINTER PROTECTION OF PLANTS

(Experimental Farms Note.)

Alternate freezing and thawing may be the cause of plants winterkilling, or the winterkilling may result from continued cold drying out the wood. This latter killing is noticeable in the case of raspberries and roses. The more mature the canes or wood the less the liability to injury. Conditions favorable for late fall growth may produce wood that will not stand the temperature if more mature, as degree of maturity in the wood will lessen the injury due to a low temperature. To protect raspberry canes they are bent over along the row and covered with soil. Care is necessary not to break the canes. The canes are bent over and the tips covered and soil filled under the parts that do not touch the ground mounding up until the whole plant is covered. This covering is removed gradually early in the spring . Climbing roses may be taken down and covered as indicated for raspberries, and the bush roses mounded up cone shaped to a depth of eight or ten inches around the plant. The branches above this may be killed but the necessary buds will be ketp alive below the covering and all th dead branches can be cut out to good buds th next spring. Over this mound around the rose plants a mulch of thre or four inches of strawy manure should be placed. This should be done just before continuous cold weather sets in, and removed as soon as the saps begins to flow in the spring. In mounding avoid leaving deep holes for water to lodge in near the roots of the plants.

Perennials are better of a light mulch about two inches deep. However, care should be exercised in not making it too deep to cause rotting of the crown. This is particularly liable to happen with the biennials such is digitalis or foxglove, campanula, pansies, sweet william and hollyhock, for which a light covering of straw just su fficient so that the plants can be seen through the straw is we find the best, or just sufficient to prevent excessive freezing and thawing but not enough to hold the crown wet during a continued mild spell.—W. S. Blair, Supt. Experimental Station, Kentville, N. S.

The process of elimination of the unprofitable cow must be gradual.

True nobility is shown by consideration and courtesy to all, and brings its reward in the fineness of perception its practice bestows.

STANFIELD'S
Unshrinkable
UNDERWEAR
RED LABEL

"It wears longer"

THERE is no underwear in Canada to-day the equal of STANFIELD'S "RED LABEL"—for the outdoor worker. Made of the best grade of pure wool, cut to fit the form, permitting perfect freedom of movement for the most strenuous winter work.

STANFIELD'S "RED LABEL" affords comfort and absolute protection against the coldest Canadian winter. *Unshrinkable*—and wears longer. Sold by most dealers. We send free sample book showing weights and textures. Write

Holstein Herd Averages 18812 lbs. Milk

A herd of 13 purebred Holsteins last year averaged 18812 lbs. milk and 638.57 lbs. fat.

Do you realize the money there is in such cows? It is estimated that the average annual yield of all cows in this country is under 4,000 lbs. These 13 cows produce as much milk as 62 cows of the 4,000-lb. class.

Why feed, milk and shelter any more cows than you need to produce the milk you require? If interested in

HOLSTEIN CATTLE

send for booklets—they contain much valuable information.

"YOU SEE IT'S A MARITIME FENCE"

Maritime fences will stand the severest tests, because they are built throughout of extra heavy hard drawn No. 9 steel wire. The superior stretching power of No. 9 wire keeps the strands from snapping under heavy strains or hard frosts. Each fence is thoroughly galvanised and will sturdily resist the rust and rot of weather.

STANDS THE TEST OF MAN, BEAST, WEATHER and TIME

The strands and stays are firmly gripped at every join by our special time tried and tested never-slip lock. Even after years of hard service, Maritime wire fence retains its sagless shape and sightly appearance. All Maritime Fences are carefully inspected and rigidly tested before leaving the factory. When you buy it you know you have got something that is bull strong and hog tight, something that will withstand greater strain than it is ever likely to receive.

Before you buy fencing it will pay you to first learn what the Maritime has to offer in the way of real fence service.

For sale by agents and dealers in nearly every section.
If you don't know the local dealer, write to us direct.

Thrift Practices on the Farm for 1920

Season for New Resolutions

The whole nation is now concerned with thrift, a lesson taught by the war.

The farmer and his family have always practiced thrift. This article summarizes thrift practices that have been common in good farming, and some practices suggested by the war —such as the almost universal habit of saving and investing in government securities.

Thrift means care and prudence in the management of resources and returns.

Thrift by the prevention of waste will help to lower the cost of living and the cost of commodities used in business of all kinds, including farming.

A thrifty population means a prosperous, progressive, contented nation.

Get More Out of Your Time and Labor

By arranging your home, outbuildings, and equipment to save work.

By using labor-saving appliances, horse power, and modern machinery whenever possible.

By giving the same value and consideration to the unpaid labor of the family as if it were paid for; by paying for labor of young people a fair price and encouraging them to save ahead for themselves.

By planning work ahead by using the slack season in preparation for the busy season and for repairs.

By getting the boys and girls into agricultural clubs to train them as to the value of time and money.

Get More Out of Your Soil

By disposing of surplus water by drainage, and preventing erosion of hill lands by terracing.

By conserving manure.

By using winted-cover crops.

By making better use of pasture and stubble.

By growing legumes and grasses on fallow and waste lands.

By taking care of your woodlot and protecting it from fire.

Get More Out of Your Building and Equipment

By fitting them to the special needs of your family and your farm.

By securing them against loss by fire; by using fire insurance to carry the risk.

By protecting them properly; by using paint and whitewash freely; by creosoting posts.

By making repairs promptly.

Get More Out of Your Crops and Stock

By securing good seed; treating it to prevent plant diseases; preparing seed beds properly.

By spraying plants against insects and palnt diseases.

By protecting orchard and garden crops from mice, rabbits and other rodents.

By improving the breeding live stock and keeping records to check up its quality.

By using preventive measures aginst animal disesases; for example, vaccination, tuberculin testing, disinfection.

By growing as much of your own food and the feed of your live stock as you can.

By using a silo to make such forage as beet tops, cane, and corn more palatable and profitable.

By conserving surplus farm and garden products by canning, drying, salting and preserving fruits, vegetables, meats and eggs.

By utilizing otherwise wasted skimmilk, whey, buttermilk, table leftovers, unsalable fruits, and vegetables to feed the pigs and poultry when they cannot be used as human food.

By providing proper storage for your products.

By effective marketing; by good grading; by co-operation with your neighbors.

Farmers Speak Plainly

Where the farmers stand in regard to organized labor and the forces of capital which are engaged in the presentent industrial conflicts was made very plain recently at a meeting of the executive of the Illinois Agricultural Association. This executive board is composed of representative farmers from all over the state and they went on record in decided tones as to their attitude to present conditions in the industrial world.

The following set of resolutions was adopted. The same resolution, by the way, were adopted recently by the representatives of Farm Bureaus which met at Indianapolis, Indiana:

1. "Capital has not reduced wartime profits to peace time condition. The strife between organized capital and organized labor is responsible in a large measure for the high cost of living. We declare the spirit of profiteering is inconsistent with the spirit of patriotism and if persisted in must lead to a national calamity.

2. "Organized labor achieved a great good for laboring classes and we want wage earners to have all that is justly due them. But organized labor too often falls under the leadership of radicalism and makes not only unreasonable demands on capital but demands prejudicial to the public welfare."

Therefore be it resolved that:

1. "We condemn the strike method of righting wrongs as duress methods of securing legislation.

2. "We condemn the demands for shorter hours which reduce production and increase the cost of living, and recommend a basic ten-hour day for all productive industries in order that farm labor may be on a par with other forms of labor.

3. "We condemn the effort to unionize the police officers of cities and regard a strike of the police which leaves a city in the hands of plunder and lust to be high crime against civil government.

4. "We condemn bolshevism, sovietism, I. W. W. movements, and denounce as traitors to this country any persons who in any way advocate anything pointing toward revolution.

5. "We declare it to be the sense of this conference that we favor a league of all industrial organizations for the purpose of determining controversies that may arise among them and for the purpose of enforcing industrial peace.

6. "Finally, we call upon all law abiding citizens to join in meeting the changing conditions of the times and in bringing our country to an economic standard of living."

These resolution were passed by the above named conferences unanimously. They speak in plain language the attitude of the farmer of the great central West toward present conditions.

The members of the conference also spoke in no uncertain terms their opinion of the city people, members of both capital and labor classes, who are advocating the reduction of the cost of living by reducing the price of foodstuffs paid to the farmer. How little the average city person realizes the true situation when he thinks that the farmer is to blame for the high cost of living is shown by this general attitude to make the farmer "the goat."

That prices cannot be reduced to the farmer as long as he is compelled to pay constantly increasing prices for labor and all materials which he has to buy is evident to everyone but the city person. If prices are to be reduced to the farmer it means the farmer must decrease his production to keep prices up.

Wyle Johnson of Bloomington, Illinois, chairman of the Live Stock Committee of the Illinois Agricultural Association, said: "The only result when the market prices of farm products are forced down is to ut production. Take, for instance, pork; market prices were recently 10 cents. The farmer then turns his attention to something else not caring to prepare an article that is dropping in value. If pork is kept down, next year will see a serious shortage with the inevitable high prices.

"It is all right to cut prices of food but when you do that you forget that the farmer—the producer— must continue to pay high prices for all the things he needs to produce that arti-

(Continued on page 197)

Get More Out of Your Home

By making the house and its surroundings healthful, convenient, comfortable and attractive.

By securing a sanitary water supply; by using running water wherever possible—a simple piped system for water may cost only a few dollars.

By providing for proper disposal of sewage.

By thorough screening against flies and mosquitos.

By adequate ventilating, lighting, and heating and well-arranged storage places.

By equipping the kitchen and other workrooms as conveniently as the farm buildings—get the man to study this problem with the woman.

By machine equipment — pump ; power washer and wringer; milk separator; churn; car, but don't buy a $3,000 car and carry water because "we can't a fford a water system."

By cutting out waste spoce and useless belongings.

By choosing furnishings that are comfortable, easy to care for, and pleasing to look at.

By providing simple, well-planned, well-cooked, palatable meals.

By choosing clothes which are comfoirtable, suitable, and becoming.

By having a simple, practicable plan for the housework and following it.

By training all the family to prevent needless work.

By providing all the family with wholesome enjoyment, recreation and chances for self-improvement — a neighborhood magazine club, for example.

By making the home a friendly, helpful part of the community—have people in and visit their homes.

Get More Out of Your Money

By knowing where it comes from and where it goes to; that is, by keeping home and farm records and planning expenditures; by taking an annual inventory of property and savings to show progress made; by having a checking account at the bank.

By buying and selling advice only from men of recognized standing and business ability; by refusing to be lured into unwise investments; shares of stock are less certain than bonds.

By distinguishing between what you need and what you wish before you spend.

By saving regularly a part of all money when received, for future needs and advancements.

By investing your savings and surplus where absolutely safe.

By having a "Ready Money Fund" invested in government securities—for emergencies, for business opportunities; starting a "home-betterment fund" from eggs or other smaller income, in Thrift and War Savings Stamps to use for some definite purpose; having each boy and girl save for an independent "start-in-ife fund" similarly invested.

The Sixteenth Maritime Winter Fair

Many events have transpired since the fifteenth Maritime Winter Fair was held in December, 1915. The occupancy of the Fair buildings by the military authorities necessitated the abandonment of the Stock Breeders' activities along Winter Fair lines, but the fact that the breeders plodded steadily on improving their herds and flocks, despite war-time conditions, was very evident to all who had the opportunity of visiting the Sixteenth Annual Winter Fair at Amherst on December 15th to 18th.

After a lapse of four years many thought the breeders would be somewhat unprepared to show to the best advantage this year. The breeders, however, on the cessation of hostilities, recognizing the importance of their industry and the prominent part they must play in the reconstruction period, lost no time to plan for the re-opening of the fair that had in the past so mightily encouraged the improvement of live stock and seeds in Canada.

Visitors to the 1919 Fair could not possibly view its various sections without being greatly impressed with the splendid work that is being done by many of our stockmen and with the unbounded loyalty of these men to their efficient President, A. E Trites, and Secretary-Manager, F. L. Fuller.

Stabled at the Fair were upwards of three hundred head of cattle ranging from the majestic steers and matronly aged cows to calves only few days old. Many of the calves were not competing for prizes but quite a number of the breeders who brought them along to take care of the surplus milk supply found them a good advertisement for their breeding operations and not a few at the close of the fair passed over to new owners.

A large number of animals of mature years also changed ownership at remunerative figures. A demand for good stock is bound to encourage our breeders to improve their herds in point of numbers and in quality.

The various herds were out in the pink of condition—the number of misfits were noticeably fed in numbers.

THE BEEF CLASSES

J. M. Laird & Son of Prince Edward Island were over with a splendid herd to vie with the R. A. Snowball, C. N. Black and Dominion Experimental Farm herds from New Brunswick and individuals from the herds of Forrest Bros., Geo. M. Holmes and A. S. Fisher from Nova Scotia.

The sweepstakes trophy, a beautiful mounted shield, donated by Massey & Co., Limited, wholesale dealers in dry goods, St. John, for the best Shorthorn animal, any age, went to Peach the first prize aged cow, owned by J. M. Laird & Son. Peach, with her two-year-old daughter, Belle Brandon, her yearling daughter, Stately Peach, and the heifer calf, Red Blossom, captured for the Messrs. Laird the R. A. Snowball silver cup for the best four Shorthorns, any age.

The Massey Harris Co. trophy, a No. 20 two horse hoe for the best beef animal, any breed or grade, went to Messrs. Laird on their white, senior yearling, heifer Stately Peach out of Peach, the sweepstakes Shorthorn by Stately Monarch.

The W. W. Black silver cup for the best grade beef animal went to Forrest Bros. for the third consecutive time on their grade two-year-old Hereford steer.

C. N. Black & Son captured the D. B. Bent $15.00 prize for the best bull, any beef breed, with a young grandson of Stately Monarch.

Forrest Bros., Edward P. Anderson, and Wm. O'Brien & Sons showed their well fitted Herefords. The O'Brien herd captured the majority of the choicest awards including the sweepstakes with their junior yearling heifer Delia Windsor.

Forrest Bros. and Anderson also got a fair share of the awards.

Horne Bros., of Prince Edward Island, showed a well fitted string of Aberdeen Angus cattle and had every thing their own way without competition.

Forrest Bros were the big winners in the finished steers class as will be seen on perusing the list of awards published elsewhere. The majority of these steers were of Hereford breeding.

There were only four beeves sent to the block. Edwards Anderson's senfor yearling Shorthorn—Angus Cross, topped the list, followed by a senior yearling Hereford pure bred steer in second place, while a pure bred aged Hereford cow dressed up for third money, and a pure bred Aberdeen Angus three-year-old heifer was at the foot of the list.

THE DAIRY TEST

The three day dairy test was conducted on the same basis as in previous years, viz.: 25 points for each pound of fat; 3 points for each pound of solids not fat and 1 point for each ten days in milk after the first 30 days. Limit ten points, with a stipulation that no four year old cow shall win a first prize that does not produce at the rate of 10 pounds of butter per week, or a second or any other prize that does not produce at the rate of 8 pounds of butter per week.

No three year old cow shall win a first prize that does not produce at the rate of 9 pounds of butter per week, or a second or any prize that does not produce at the rate of 7 pounds of butter per week.

No two year old heifer shall win a first prize that does not produce at the rate of 8 pounds of butter per week, or a second or any other prize that does not produce at the rate of 6 pounds of butter per week.

No heifer, one year old, shall win first prize that does not produce at the rate of 7 pounds of butter per week or a second or any other prize that does not produce at the rate of at least 5 pounds of butter per week.

Tied up in the Dairy Test stables were 24 Ayrshires, 17 Holsteins, 9 Guernseys, 4 Jerseys, and 13 Grades. The total aggregate was not up in point of numbers to that of 1915, the obvious reason being that it takes a long time to plan ahead for a dairy test.

The highest scoring cow at the Fair was the aged cow Gardrum White Floss, 50306, shown by the Nova Scotia Agricultural College, scoring 270.98 points, with a milk production of 198.1 lbs., yielding 8.75 lbs. fat and 17.49 lbs. solids not fat. It may be said, however, that this cow was shown, not in competition for the prize monies, but for the educational feature of having such a cow displayed where she could be seen, and her excellent qualities studied by the visiting farmers from the three provinces.

The first prize money and sweepstakes award went to her closest competitor in her class, and to the next highest scoring cow, Ruby Westboro Fayne, a three-year-old Holstein, exhibited by Fowler Bros., that scored 265.36 points on a milk production of 247.1 lbs. yielding 8.14 lbs. fat and 20.02 lbs. solids, not fat.

Owing to the lack of space and the short time intervening between the closing of the fair and our going to press, the detailed scores will not appear until next issue. In the meantime, our readers will be interested in the following list which shows the prize winners in their respective dairy classes and the score of each individual:—

DAIRY TEST

Shorthorns

Cow, 4 years old and upwards—2 and 3, Geo. M. Holmes.

Ayrshires

Cow, 4 years old—1, N. S. Agricultural College, Truro, N. S., 270.97; 2, F. S. Black, 199.17; 3, Bert R. Brown, 195.11; 4, A. McRae & Sons, 193.52; 5, McIntyre Bros., 167.80; 6, John Retson, 164.59; 7, F. S. Black, 162.93.

Cow, 3 years old—1, Geo. L. Boswall, 182.01; 2, Bert R. Brown, 140.01; 3, McIntyre Bros., 138.79; 4, Geo. Retson, 136.95; 5, Roy W. Stephen, 136.92; 6, McIntyre Bros., 125.25.

Ayrshire heifer, 2 years old—1, A. McRae & Sons, 117.45; 2, John Retson, 115.40; 3, F. S. Black & Son, 112.29; 4, John Retson, 102.29; 5, McIntyre Bros., 101.56.

Ayrshire heifer, 1 year old—1, Bert R. Brown, 119.05; 2, McIntyre Bros., 106.16.

Holsteins

Cow, 4 years old—1, Arthur Dickie, 257.07; 2, P. S. Bremner & Son, 244.37; 3, Fowler Bros., 218.47; 4, Dickie Bros., 199.53; 5, R. L. Hicks, 145.24; 6, Dickie Bros., 107.23.

Cow, 3 years old—1, Fowler Bros., 265.36; 2, R. L. Hicks, 239.05; 3, N. S. A. College, 230.73; 4, Fowler Bros., 184.45; 5, R. L. Hicks, 182.08.

Heifer, 2 years old—1, Dickie Bros., 198.62; 2, Dickie Bros., 180.20; 3, Arthur Dickie, 176.60; 4, Dickie Bros., 165.78; 5, R. L. Hicks, 129.25.

Heifer, 1 year old—1, Arthur Dickie, 153.79.

Guernseys

Cow, 4 years old—1, D. G. McKay & Son, 186.37; 2, Roper Bros., 156.29; 3, Roper Bros., 137.98; 4, D. G. McKay & Son, 134.63.

Heifer, 2 years old—1, D. G. McKay & Son, 117.36; 2, D. G. McKay & Son, 104.03; 3, Roper Bros., 91.92; 4, Roper Bros., 81.65.

Heifer, 1 year old—1, Roper Bros., 94.13.

Jerseys

Cow, 4 years old—1, H. S .Pipes & Son, 144.95; 2, R. A. Snowball, 143.82.

Cow, 3 years old—1, H. S. Pipes & Son, 111.88; 2, H. S. Pipes & Son, 110.14.

Grades

Cow, 4 years old—1, Fowler Bros., 233.80; 2, Fowler Bros., 222.38; 3, Roper Bros., 176.48; 4, Courtenay Lusby, 174.86; 5, E. P. Anderson, 163.85; 6, D. G. McKay & Son, 151.69.

Cow, 3 years old—1, T. W. Keillor, 171.50; 2, Chas. Etter, 141.69; 3, H. S. Pipes & Son, 131.23; 4, Row W. Stephen, 120.93; 5, H. S. Pipes & Son, 105.44.

THE SHEEP CLASSES

The sheep classes, as usual at Amherst, were out in prime condition to the tune of 266 head. The various breeds were well represented as will be seen by the published list of awards.

The Bank of Montreal special prizes for the best pens of four lambs went to James I. Stewart and Burder Goodwin with their Shropshires and Oxford Downs.

The Bank of Commerce special for the best three shearling wethers, went to a trio of South Down shown by Oliver Saunders, who also captured first place in the dressed carcass group of three yearling wethers, and who thoughtfully, in appreciation of Mr. Fuller's work in behalf of the stock breeders, presented him with the best dressed carcass. Mr. Fuller appreciated this token of thoughtfulness, which was an utter surprise, but nevertheless welcome.

The New Brunswick Wire Fence Co. special prize of 40 rods of wire fencing for the best collection of sheep, all one breed, went to the veteran Shropshire breeder, James I. Stewart.

Shropshires in the hands of Geo. L. Boswall won the Royal Bank special prize for best pen, consisting of one ewe lamb, 1 shearling ewe and one two year old ewe.

The best group of three lamb carcasses was shown by R. A. Snowball.

SWINE

The Swine display was not up to 1915 in point of numbers. The total number being 63, of which 38 went to the block. The grand championship silver cup donated by the Atlas Stock Food Co. for the best bacon animal, any breed or age, went to a Yorkshire barrow, under 9 months, exhibited by Geo. L. Boswall.

The quality of the swine classes was of a high order and a clear indication that it is not necessary for any one to go outside the Maritime Provinces for good young stock next spring.

POULTRY

Poultry, as usual, made up the noisy end of the show, but despite the (fowl language) as our friend Rev. Father Tompkins so aptly termed the commotion, the visitors spent a great deal of time in this department viewing the many splendid specimens of the respective breeds numbered among the 1300 birds on exhibition.

The best exhibit of American breeds was made by Samuel Steeves with his White Wyandottes, capturing the Maritime Poultry Association Silver Cup. This cup was also won by Mr. Steeves at the time the 1916 Maritime Poultry Show was held at Moncton.

The Silver Cup donated by E. N. Rhodes, M. P., for the best two cockerels and best two pullets in the Utility Class, was captured by A. V. Gibson, with a quartet of Buff Orpingtons.

The best Barred Rock display was made by T. C. Latham, who captured the Kingsdale Cup.

The poultry display included only three turkeys, 21 ducks and 34 geese.

There was a fair display of dressed poultry with quite a lot of room for improvement in their preparation for the show.

The display of eggs graded for market was carefully noted by both producers and consumers who visited the fair.

SEEDS

The seed grain display was the best yet seen at Amherst.

The Wm. Ewing Silver Cup for the best exhibit of wheat, oats and barley went to R. A. Snowball. This winning reflects a lot of credit on Mr. Snowball's progressive farm and stock manager, Mr. James Easton, who recognizes the importance of good seed to the live stock breeder, as Dr. Cumming so aptly showed forth in his address at the Seed Growers' meeting.

The S. J. Moore Silver Cup for the best selected and arranged group exhibit of any variety white oats, went to Jas. E. Murphy of Prince Edward Island, who also captured the Steele Briggs Cup for the most creditable showing in not more than three varieties of selected seed.

THE ATTENDANCE

The attendance at the Fair was rather disappoiting, owing to the extremely cold weather, which made driving in the country rather unpleasant and particularly so as there was no sleighing.

The opening exercises were presided over by Mr. A. E. Trites, President of the Maritime Stock Breeders' Association. His Worship Mayor Rogers of Amherst and Warden G. N. Allen, of Cumberland, welcomed the visitors in behalf of the town and county. H. M. Canfield, President of the Amherst Board of Trade, also extended a hearty welcome in behoif of the Board.

The reply in behalf of the M. S. B. A. was made by Hon. W. M. Lea, Commissioner of Agriculture for P. E. I. in a most practical manner, during the

course of which he touched upon many of the problems confronting the farmers of the Maritime Provinces.

Hon. J. E. Sinclair, M. P. for Queens County, P. E. I., in the absence of Hon. M. McKinnon, Lieutenant-Governor for P. E. I., declared the Fair officially open and strongly eulogized the Sock Breeders' Association for the manner in which they had continued to carry on matters relative to live stock improvement during the period when our country was at war and no Fairs were held.

Hon. J. F. Tweeddale, Minister of Agriculture for New Brunswick, was the last speaker of the evening. He expressed his pleasure at the splendid showing that was being made in the various sections of the Fair. In the course of his remarks he enumerated the various activities of his Department and his close co-operation with the Federal Department of Agriculture to advance the live stock interests of his Province.

Prior to the official opening the Director's Banquet was held. The ladies of the Amherst Hospital Aid, headed by their president, Mrs. Allen, catered to this pleasant event at which upwards of two hundred stock men and their invited guests enjoyed the toothsome repast and the addresses of the various speakers who proposed and responded to the various toasts, among whom were Hon. L. P. D. Tilley, Hon. H. J. Logan, Hon. E. H. Armstrong, Hon. Fred Magee, Mr. S. J. Moore, Prof. G. E. Day, W. S. Harding, L. H. Newman, C. C. Avard and others.

THE CONVENTIONS

During the Fair week several important meetings were held in the board room—The Canadian Seed Growers' Association, The Maritime Bee Keepers' Association, The Maritime Poultry Association, The Maritime Sheep Breeders' Association and the Canadian Guernsey Breeder's Association, as well as a number of interesting meeting for propaganda and reconstruction work, reports of which will appear in future issues.

The trophy offered by Dr. M. Cumming to the person making the highest score in judging beef cattle, dairy cattle and sheep, was awarded to W. A. Flemming, Truro, while the M. S. B. A. Trophy to the person not a regular student of an Agricultural College, making the highest score in the above section, went to Major McRae, Charlottetown.

PRIZE WINNERS AT THE SIXTEENTH ANNUAL MARITIME WINTER FAIR

BEEF CATTLE

Shorthorns

Steer, two years and under three—1, Forrest Bros.

Steer, 18 mos., and under 2 years—1, Forrest Bros.; 2, J. M. Laird & Son.

Steer, 1 yr., and under 18 mos.—1 J. M. Laird & Son.

Steer, under 6 mos.—1 and 2, George Holmes.

Cow, 4 years old or over—1 and 2,

Cow, 4 years old or over—1 and 2, J. M. Laird & Son; 3 and 5, R. A. Snowball; 4, A. S. Etter.

Cow or heifer, 3 years and under 4—1, J. M. Laird & Son; 2, R. A. Snowball; 3, Experimental Station, Fredericton.

Heifer, 2 yrs. and under 3—1 and 2, J. M. Lard & Son; 3, Experimental Station, Fredericton; 4, R. A. Snowball.

Heifer, 18 mos. and under 2 yrs.—1, J. M. Laird & Son; 2, Experimental Station, Fredericton; 3, R. A. Snowball; 4, George Holmes.

Heifer, 1 yr. and under 18 mos.—1, C. N. Black & Son; 2, J. M. Laird & Son; 3, R. A. Snowball; 4, A. S. Etter.

Heifer, six months and under 1 yr.—1, Experimental Station, Fredericton; 2 and 3, J. M. Laird & Son; 4, R. A. Snowball; 5, Experimental Station, Fredericton.

Heifer, under six mos.—1 and 2, J. M. Laird & Son; 3, R. A. Snowball; 4, A. S. Etter.

Bull, 3 months and under 1 yr.—1, C. N. Black; 2, J. M. Laird & Son; 3 and 4, R. A. Snowball; 5, George Holmes.

Sweepstakes—Best Steer or Heifer any age—J. M. Laird & Son.

Donated by Canadian Shorthorn Breeders' Association.

Best Pure Bred Steer, any age—1 and 2, Forrest Bros.

Best pure bred Heifer, any age—1 and 2, J. M. Laird & Son.

Bull, 3 mos. and under 1 yr.—1, C. N. Black & Son; 2, J. M. Laird & Son.

Shield donated by Vassie & Co., for best Shorthorn animal, any age—J. M. Laird & Son.

Silver Trophy donated by R. A. Snowball for best group of four Shorthorn animals, won by J. M. Laird & Son.

Heresford and Devons

Steer, 2 yrs. and under 3—1, Forrest Bros.

Steer, 18 mos., and under 2 yrs.—1, Edward Anderson; 2, Forrest Bros.

Steer, 1 yr., and under 18 mos.—1, Edward Anderson; 2, Forrest Bros.

Cow, 4 yrs. old or over—1 and 4, Forrest Bros.; 2 and 3, Wm. O'Brien & Son; 5, Edward Anderson.

Cow or heifer, 2 yrs. and under 4—1 and 2, Wm. O'Brien & Sons.

Heifer, 2 yrs. and under 3—1, 2 and 3, Wm. O'Brien & Sons.

Heifer, 18 mos., and under 2 yrs.—1 and 2, Forrest Bros.

Heifer, 1 yr. and under 18 mos.—1 and 2, Wm. O'Brien & Son; 3, Edward Anderson.

Heifer, 6 mos. and under 1 yr.—1, Wm. O'Brien & Sons; 2, Forrest Bros.

Heifer, under 6 mos.—1 and 4, Wm. O'Brien & Son; 2, Edward Anderson; 3, Forrest Bros.

Bull, 3 mos. and under 1 yr.—1 and 4, Wm. O'Brien & Son; 2, Edward Andersin; 3, Forrest Bros.

Sweepstakes, Steer or heifer, any age—Wm. O'Brien & Sons.

Aberdeen Angus and Galloways

Cow, 4 yrs. old or over—1, 2 and 3, Horne Bros.

Cow or heifer, 3 yrs. and under 4—1 and 2, Horne Bros.

Heifer, 2 yrs. and under 3—1, 2 and 3, Horne Bros.

Heiver, 18 mos., and under 2 yrs.—1, Horne Bros.

Heifer, 1 yr. and under 18 mos.—1, Horne Bros.

Heifer, 6 mos. and under 1 yr.—1, Horne Bros.

Heifer, under 6 mos.—1, Horne Bros.

Bull, 3 mos., and under 1 yr.—1, 2 and 3, Horne Bros.

Sweepstakes, best steer or heifer, any age—Horne Bros.

GRADE BEEF

Steer, 2 yrs. old and under 3—1, 2 and 4, Forrest Bros.; 3 and 5, C. W. Pugsley & Son; 6, Arthur Etter.

Steer, 18 mos. and under 2 yrs.—1, Edward P. Anderson; 2 and 3, Forrest Bros.

Steer, 1 yr. and under 18 mos.—1, Edward P. Anderson; 2, 3 and 4, Forrest Bros.

Steer, under 6 mos.—1, Forrest Bros.; 2, Chas. Etter.

Steer, 6 mos. and under 1 yr.—1, Experimental Station, Fredericton; 2, Edward P. Anderson; 3, Forrest Bros.

Cow, 4 yrs. old and upwards—1 and 4, Wm. O'Brien & Sons; 2, Arthur Etter; 3, J. M. Laird & Son; 5, Forrest Bros.; 6, Geo. M. Holmes.

Cow, 3 yrs. old and under 4—1, J. M. Laird & Son; 2, Forrest Bros.

Heifer, 2 yrs. and under 3—1 and 3, Forrest Bros.; 2, J. M. Laird; 4, Geo. Holmes.

Heifer, 18 mos., and under 2 yrs.—1 and 4, Forrest Bros.; 2, J. M. Laird & Son; 3, Edward P. Anderson; 5, Geo. Holmes.

Heifer, 1 yr. and under 18 mos.—1, J. M. Laird & Son; 2, Edward P. Anderson; 3, 4 and 5, Forrest Bros.; 6, W. E. Harding.

Heifer, 6 mos., and under 1 yr.—1, Wm. O'Brien & Sons; 2, Forrest Bros.; 3, Edward P. Anderson; 4 and 5, Experimental Station, Fredericton; 6, R. A. Snowball.

Heifer, under 6 mos.—1, Wm. O'Brien & Sons; 2, R .A. Snowball; 3, Forrest Bros.; 4, Edward P. Anderson.

Sweepstakes, best animal, any age—Forrest Bros.

Special Prizes Offered by Live Stock Branch Federal Department of Agriculture for Finished Steers, Any Breed or Grade

1200 lbs. or over—1, 2 and 3, Forrest Bros.; 4, C. W. Pugsley & Son.

raan EfnR..Offi ffiF M;P3 etaoinnn

1000 to 1200 lbs.—1, 3 and 5, Forrest Bros.; 2, C. W. Pugsley & Son; 4, Edward P. Anderson.

Under 1000 lbs.—1, 2, 3 and 4, Edwd. P. Anderson; 5, C. W. Pugsley & Son.

For Groups finished Steers any Breed or Grade

Best 3, owned by one exhibitor—1, Forrest Bros.

Best 5 owned by one exhibitor—1 and 3, Forrest Bros.; 2, Edwd. P. Anderson; 4, C. W. Pugsley & Son.

Silver cup donated by W. W. Black for best grade beef animal, any age, won by Forrest Bros.

Two horse hoe donated by Massey Harris Co., Moncton, for best beef animal, any breed or grade, won by J. M. Laird & Son.

Fifteen dollars in goods donated by B. D. Bent, Amherst, for best bull, any beef breed, won by C. N. Black & Son.

DRESSED BEEF CARCASES

Dressed beef carcass from animal shown in foregoing classes—1, A. P. Anderson; 2, Forrest Bros.; 3, Wm. O'Brien & Sons; 4, Horne Bros.

Special Prize Offered by the Live Stock Branch, Federal Department of Agriculture.

Dressed Carcasses, Hogs—1, Bert R. Brown; 2, Fowler Bros.; 3, Fowler Bros.; 4, Bert R. Brown; 5, E. J. Vessey; 6, Geo. L. Boswall; 7, Geo. L. Boswall; 8, A. E. Dickie; 9, A. E. Dickie; 10, E. J. Vessey.

Best Group of 3—1, Fowler Bros.; 2, Bert R. Brown; 3, S. O. Stewart & Son; 4, A. E. Dickie; 5, Jas. J. Stewart; 6, Logan Bros.

Best Group of 5—1, Geo. L. Boswall; 2, E. J. Vessey; 3, eGo. M. Holmes.

DAIRY BREEDING CLASSES

Ayrshire

Heifer, 18 mos. and under 2 yrs.—1, Wm. R. Yonker; 2, McIntyre Bros.; 3, Burt R. Brown; 4, Geo. Retson.

Heifer, 1 yr. and under 18 mos.—1, Burt R. Brown; 2, John Retson; 3 and 4, McIntyre Bros.

Heifer, 6 mos. and under 1 yr.—1, John Retson; 2, A. McRae & Sons; 3, Experimental Station, Fredericton; 4, Burt R. Brown; 5, Geo. Retson.

Bull, 3 mos., and under 1 yr.—1, John Retson; 2, A. McRae & Sons; 3, McIntyre Bros.; 4, George Retson.

Best Heifer, any age—1, Wm. R. Yonker.

Holsteins

Heifer, 18 mos. and under 2 yrs.—1, R. L. Hicks; 2, Dickie Bros.; 3, Exp. Station, Fredericton; 4, A. S. Etter.

Heifer, 1 yr., and under 18 mos.—1 and 2, Dickie Bros.; 3, Exp. Station, Fredericton.

Heifer, 6 mos. and under 1 yr.—1 and 4, Dickie Bros.; 2, T. W. Keiller; 3, A. E. Dickie.

Bull, 3 mos., and under 1 yr.—1, 2 and 3, Dickie Bros. ;4, W. L. Fillmore.

Best heifer, any age—1, Dickie Bros.

Jerseys

Heifer, 18 mos., and under 2 yrs.—1, 2 and 3, H. S. Pipes & Sons.

Heifer, 1 yr., and under 18 mos.—1 and 2, H. S. Pipes & Sons.

Heifer, 6 mos., and under 1 yr.—1 and 3, H. S. Pipes & Sons; 2 and 4, J. R. Semple.

Bull, 3 mos., and under 1 yr.—1, H. S. Pipes & Son; 2, J. R. Semple.

Best heifer, any age—H .S. Pipes & Son.

Guernseys

Heifer, 18 mos. and under 2 yrs.—1, Roper Bros.; 2, J. Milligan & Son.

Heifer, 1 yr., and under 18 mos.—1, Roper Bros.

Heifer, 6 mos., and under 1 yr.—1, 2 and 3, D. G. McKay & Son; 4, J. Milligan & Son.

Bull, 3 mos., and under 1 yr.—1, J. Milligan & Son; 2 and 3, D. G. McKay & Sons.

Best heifer, any age—1, D. G. McKay & Son.

Grades

Heifer, 18 mos., and under 2 yrs.—1, Expeirmental Station, Fredericton; 2, McIntyre Bros.; 3, T. W. Keiller; 4, Geo. Holmes; 5, Courtney Lushy.

Heifer, 1 yr., and under 18 mos.—1, A. McRae & Sons; 2, Geo. Holmes; 3, W. E. Harding.

Heifer, 6 mos., and under 1 yr.—1, Experimental Station, Fredericton; 2, R. A. Snowball; 3, Exp. Station, Fredericton; 4, F. S. Black; 5, Geo. Holmes; 6, Roy W. Stevens.

Best animal, any age—1, A. McRae & Sons.

SHEEP

Leicesters

Ewe, 2 yrs. old or over—1, 2 and 3, S. L. Boswall; 4, S. C. Stewart & Son.

Ewe, 1 yr. and under 2—1 and 3, S. L. Boswall; 2 and 4, S. C. Stewart & Son.

Ewe Lamb—1, 2 and 3, S. C. Stewart & Son; 4, S. L. Boswall.

Yearling wether—1 and 2, S. L. Boswall.

Wether lamb—1 and 2, S. L. Boswall.

Lincolns

Ewe, 2 yrs. old or over—1 and 2, Albert Boswall; 2 and 4, C. W. Pugsley & Son.

Ewe, 1 yr. and under 2—1 and 2, Albert Boswall; 3 and 4, C. W. Pugsley & Son.

Ewe lamb—1, 2 and 4, Albert Boswall; 3, C. W. Pugsley & Sons.

Yearling wether—1 and 2, C. W. Pugsley & Sons.

Wether lamb—1 and 2, C. W. Pugsley & Son; 3, George L. Boswall.

Cotswold

Ewe, 2 yrs. old or over—1, Almon Boswall; 2 and 3, George Retson.

Ewe, 1 yr. and under 2—1 and 2, Almon Boswall; 3, George Retson.

Ewe lamb—1, George Retson.

Cheviots

Ewe, 2 yrs. old and over—1, 2 and 3, John H. King & Son; 4, Cephas Nunn.

Ewe, 1 yr. and under 2—1, John H. King & Son.

Ewe Lamb—1, 2, 3 and 4, John H. King & Son.

Yearling Wether—1, Albert Boswall.

Horned Dorsets

Ewe, 2 yrs. old and over—1, 2 and 3, Geo. L. Boswall.

Ewe, 1 yr. and under 2—1 and 2, George L. Boswall.

Ewe Lamb—1, 2, 3 and 4—George L. Boswall.

Yearling lamb—1 and 2, George L. Boswall;

Southdowns

Ewe, 2 yrs. old and over—1 and 4, Oliver Saunders; 2 and 3, J. R. Semple.

Ewe, 1 yr. and under 2—1, J. R. Semple; 2 and 4, Oliver Saunders; 3, E. Saunders.

Ewe lamb—1, 2 and 3, Oliver Saunders; 4, E. Saunders.

Yearling wether—1 and 2, Oliver Saunders.

Wether lamb—1, 2, 3 and 4, Oliver Saunders.

Shropshires

Ewe, 2 yrs. old and over—1 and 2, Geo. L. Boswall; 3, John H. King & Son; 4, Jas. I. Stewart.

Ewe, 1 yr. and under 2—1 and 2, Geo. L. Boswall; 3, John H. King & Son; 4, Jas. Stewart.

Wether Lamb—1, Geo. L. Boswall.

DECEMBER 23, 1919

A MERRY CHRISTMAS AND A HAPPY NEW YEAR TO ALL MARITIME FARMER READERS

The management, Editors and staff of the Maritime Farmer extend their best wishes for a Merry Christmas and Happy New Year to all its readers.

A SEASON FOR NEW RESOLUTIONS

The Christmas rush is on. By the time this number of the Maritime Farmer reaches its readers, Christmas will be here and the New Year, 1920, will be closely following on the trail of the old year. It is always well to reflect and at this season take a retrospect of the work accomplished during the year. Success and progress will be evident in many instances, but there will also be cases of failure and retrogression. Successes are always inspiring—they encourage greater effort in future operations—but what of the failures? Have they brought their lesson? Have they pointed out a needed rebuke for doing work in a manner not consistent with good business methods? If they have not had this effect, the same failures are liable to occur again. If they have taught their lesson and an honest effort is made to prevent their recurrence by paying stricter attention to business details, they will have proven a blessing in disguise.

Lest we forget, it is well to review the year's work now and make our resolutions for the future. There are so many places where we can all do just a little better than we have done in the past. Let New Year resolutions be made, not to be broken, but to be fulfilled, and the close of the year 1920 will find us all on a higher plane mentally, morally, physically and financially. We will all be better citizens and our community will be a better and happier place in which to live.

WHY NOT RAISE CERTIFIED SEED POTATOES?

A recent issue of the Potato Magazine says:—"If you had a chance to get part of a million dollars, you would jump at the chance, and yet there are over $1,000,000 worth of seed potatoes going to southern markets every year. There is no trouble to get one hundred per cent more for seed stock than is procured for ordinary market potatoes."

There are sections of the Maritime Provinces that are eminently adapted to the growing of seed potatoes, free from disease, just the kind of stock that our southern friends desire. A word to the wise is sufficient.

FARMERS' HOURS AND FOOD PRICES

Laborers of the city are asking for shorter hours, higher wages, and cheaper foods. Demands have been made by miners for a five-day week, consisting of 30 hours, and a 60% increase in wages. For some time a very large number of the city laborers have been working but 48 hours a week. If labor has become efficient enough and machinery has supplemented their efforts sufficiently to enable them to sustain themselves and their families by working 30 to 48 hours a week, there can be no serious objection made against this plan. But let us view the hours necessary for the farmer to work in order that he may supply these people with food and gain a competency for himself and family. There are very few farms, if any, that do not require the owner or some of the hired help to devote some time every day in the week. There are no free days, no half holidays, as in other industries. If we survey the hours of labor that the farmer puts in each week we find they vary from 60 to 80. In other words, the farmer labors nearly double the hours of those engaged in many other enterprises. The labor income per hour of the farmer has never been equivalent to that of the man who works at skilled labor in the city.

The farmer, it is true, is making progress. If he applies himself industriously and intelligently to his work, he is capable of securing for himself a competency for old age. This is done by the utilization of his time, his family, and through thrift. Farming is not an individual job—it is a family undertaking, and when all hands apply themselves to the labor of the farm, there is opportunity for each one to work and this, in the sum total, amounts to a considerable income. If the laborer's family of the city were in position to work the same number of hours a day as the farmer's family and to earn the same amount of money that the farmer's children earn for him, his occupation would prove in most cases more remunerative than the farmer's.

The city laborer is not proceeding along safe grounds for himself or for industry, as a whole, when he is asking for shorter hours, higher wages, and cheaper foods The higher wages of the city affect the farmer, for there is a tendency everywhere for laborers to seek the market where they can secure the highest return for their labor. This has brought about a shortage of labor on the farm, and it has forced the farmer to pay a higher compensation for his help. If prices of foods are not in keeping with the prices of labor, the farmer will not hire help but will prefer to let some of his acres lie idle. He will reduce his herds and flocks so that his family can take care of them more comfortably than in the past.

It is not necessary to look far for an example which will illustrate this point. Hogs advanced to $24 per hundred last summer and two or three weeks ago they declined to $12.25 per hundred. This rapid falling off in price was not due to the large receipts in the market, for spring pigs had not then begun to make their way to the market to any considerable extent. But the prices fell. Various reasons are given which we will not discuss here. The results, however, brought about this condition. Farmers are hesitating to feed high priced corn to their young pigs. We know of eleven little pigs, seven weeks old, which were offered for sale for $30. These pigs would have been readily purchased before the decline in price because they would have been a good bargain and the farmer could have made some profit by feeding his corn to them if hogs had remained at $18 or $20 per hundred, but there seems to be no market for these little pigs now. It is due to the uncertainty of making any profit by feeding them.

This is only one illustration, but it points out clearly how farmers retrench in their products when prices will not return some profit for their labor. It is, therefore, unreasonable for the city laborer to push his demands for shorter hours and higher wages unless he is willing to pay present prices for foods. He may find himself and family hungry next year because the farmer has not worked his acres to their full limit.—Hoard's Dairyman.

WATER AND MILK

It is just as important to provide a cow with an adequate quantity of water and in the right condition as it is to provide a suitable ration. Milk is 87 per cent water and 13 per cent solids. This fact needs no argument in behalf of water. What we must consider is how the water should be supplied and in what condition.

We have no hesitancy in recommending the drinking cups as this keeps fresh, warm water, that is, water at a temperature of 50° F. or above, before the cow all the time. If this method is not followed the system of watering the cow in the manger may well be practiced. The next best method is watering the cows twice a day from a tank which is protected from the cold winds and where the water may be warmed by a tank heater. We would discourage the practice of giving dairy cows cold water but once a day and in a cold place. Under such conditions no dairy cow will drink enough water to supply her needs and, further, what she does drink must be warmed with expensive feeds. The result will be a shrinkage of milk flow per cow per day of at least two or three quarts of milk and a larger consumption of feed. The shrinkage in milk flow at the present price of milk would soon pay for the best kind of a watering system. Providing cows with warm, fresh water in the barn not only produces more milk and saves feed, but is a great saving of labor which is no small item now.

A man who permits his cows to have water but once a day and that from a hole in the ice or from a tank of ice water is not making money with cows. What is more he is not entitled to make money. The fact that water forms a large part of milk; that cows drink water at night as well as in the day time; that they will not drink enough once a day to supply their needs; that it requires feed to warm water, if other provisions are not made, should lead every sensible man to supply his cows with an adequate supply of warm, fresh water. Give the cow an opportunity to become a "drinker."

The tested and approved cow and the dairyman determined to do his best, makes a winning combination.

* * *

Make the most of yourself, for that is all there is of you.—Ralph Waldo Emerson.

The silo, cream separator and the manure sperader are indispensable to the successful dairy farmer.

* * *

Barnyard manure or commercial fertilizers help to make big yields.

FARMERS SPEAK PLAINLY

(Continued from page 193)

cle. In other words, his cost of living isn't helped at all. Reduce the cost of production of farm produce before you can expect to see the price of farm produce become lower."

And in that last sentence Mr. Johnson voiced the sentiment of farmers in general.

The reduction of the price of the food depends upon the reduction of the cost of production—and the farmer can't reduce that cost alone. Everything he uses to produce food must come down. The people of the cities must wake up to the fact that they can't work eight hours a day or less producing the things the farmer uses to produce food and then expect him to work sixteen or more hours a day in giving them cheaper food.

Capital and labor can't keep on fighting and expect the farmer to feed them in their idleness—and with cheaper food.

They have got to learn that they have got to quit fussing and get in the game and produce if they expect to reduce costs. The day of making the farmer a goat is passing. The various farm organizations speaking for the farmer are telling in no uncertain voice what they think of capital and labor, and that voice is going to he heard. The people are going to wake up to the fatc pretty soon that they are dependent on the farmer absolutely and that if they expect to live reasonahly or live at all for that matter(they have got to get over their fussing and fighting and get down to brass tacks and keep their feet on the ground and get busy. Work a real day's work for a decent wage, produce adequate goods for an adequate price, help reduce the cost of raw materials to the farmer, and then they will see the cost of living drop and not until then.

With labor and capital in the present turmoil the country is going to realize that after al there is one cool head in the country, that there is a steady hand on the steering wheel and that hetter times are coming if they work with that cool head and steady hand, and that head and hand belong to the sanest branch of our present civilization—the farmer.

TILE-DRAIN YOUR LAND

Under-draining renders the soil more porous and facilitates thorough cultivation by carrying off rapidly the surface water by filtration, thus drying the land quickly.

In deciding to under-drain, careful study should be given to the best manner of laying out a system of drains, the aim heing to secure the greatest fall, the least amount of digging, the hest outlet for tile and the most perfect drainage.

Drains should be laid so that no two lines will take the water from the same territory. The outlets should be as few as possihle and large enough to carry off all the water. Where a good fall is doubtful, it is hest to employ the services of an engineer. If the land-owner proposes to act as his own engineer, the hest instrument is a spirit level, with an eight-foot straight edge, the straight edge to be placed level on top of two pickets. The operator can then sight ahead to any reasonahle distance.

When the levels are taken, it is well to mark the depth on a stake and at the same time to mark them in a note-book, as the stakes are liable to be disturbed.

Opening the Trenches

When possible, use the ditching machine, as it will materially lessen the cost. If a ditching machine cannot be secured, horsepower should be used. The bottom should be dug with a narrow draining spade or shovel and the loose earth should be thrown out with a crummer. To secure the proper grade for the bottom of the drain, the spirit level should be used with a straight edge. The grade should he dug about 100 feet before laying the tile.

Fall of Drain Should Not Be Less Than 2 Inches to 100 Feet

The depth of the drain will vary with the character of the soil and the nature of the slope. The outlet of the tile drain should be clear and unobstructed. The first ten feet of the drain should be a thick plank hox placed back a considerahle distance to keep the cattle from disturbing the outlet.

The proper size of tile can be definitely stated only when the detailed conditions under which one is to work are known. They should he large enough to remove, in from 36 to 48 hours, the excess water of the heaviest rains likely to occur. No tile should he used less than 3" diameter.

Tile laying should begin at the outlet of the main, proceeding upward to the first lateral, where the junction should he made and tile enough laid in the lateral to permit the main to be partly filled. Teh greatest care should be taken to pack sods or straw ahout the joints so as to avoid large openings through which the water may rush during heavy rains, washing silt into the tile.

Filling the Ditch

After the sod or straw has been well placed on top of the tile it is necessary to put in one foot or more of surface soil and sods which were first ploughed out. This will allow the water to enter the tile more freely and at the same time will keep out fine sand. Th balance of the drain may be filled in with either the plough or drag scraper. The ordinary road machine also makes an excellent joh.—John Fixter, Supervisor, Illustration Stations

MAINTAINING EFFICIENCY IN FARM MACHINERY

The saving that comes to the farmer who keeps his farm machines in perfect working order is great. Efficient machines mean good work quickly done and at proper time. Neglected machines mean delays—poor work, loss of time and labor.

Every farmer should have a repair shop of ample size aid equipped with tools and repair materials sufficient to make any needed repair or adjustment required to keep the farm machines up to a high standard of working efficiency. Under good management, days or hours when weather conditions are unfavorable to out door work will be spent on farm machine adjustment or repair. During the winter period, all machines should be given careful inspection. Go over each piece with a wrench, tighten all loose nuts, replace lost holts, screws or nails or put in additional ones if needed. All parts that are exposed to wear in the soil as harrow teeth, drill and cultivator shovels, discs, plough points, etc., should he properly sharpened and put back into position. Soil tillage tools such as disc harrows, cultivators and ploughs should have all bright surfaces coated with a rust preventative, such as axle grease or machinery oil or anti-rust grease, hefore heing put away after the season's work. At the close of the haying season and also at the close of the harvest, a card should he tied to each machine used and notes of needed repairs written thereon. This card record will serve as a guide and save much time when the day arrives on which the machine is to be repaired, in that it will indicate just what is wanted. Some immediate lork is required on all haying and harvesting machinery the very day on which the work ceases. A good cleaning brush and cloth, followed hy an application of oil or grease to all parts that are not protected by paint or other covering, is the first essential. Then write up the needed repair record and await the day. To give good service, mower and binder knives and also the ledger plates on which such move, should be in proper alignment and very sharp. Spare knives shoult be kept at hand and ready, all rivets should be hammered tight, hroken blades or ledger plates removed and renewals put in. Paint will preserve the wood and metal portions of all implements from the weathering influences, adding much to a machine's durahility and appearance. Farm machines should be painted frequently; no farm boy can take pride in a ramshackle, weather beaten machine.

The machine tool box or the man operating any machine or implement should he supplied with useful wrenches, pliers, hammer, bolts, nails and other necessary repair material with which all field repairs or adjustments may he made. Neglect to oil has done more to reduce the period of usefulness of farm machines than any other factor. Good luhricating oil applied to the hearings as needed will increase the period of usefulness of any machine. The great neglect, no oil on the hearings, is causing a loss to Canadian farmers that would aggregate millions of dollars each. Develop the hahit of taking care of your machinery and keep it as fit as a well-cared-for horse. Protect from weather, keep all parts tight and in proper adjustment and don't neglect the oiling.—L. Stevenson, Supt. Experimental Station, Sidney, B. C.

LOSS SMALL IN PROPERLY STORED POTATOES

Potatoes properly stored should not sustain a loss throughout the winter season of more than 5 per cent., and under exceptionally good conditions not more than 3 or 4 per cent., according to specialists of the United States Department of Agriculture. The maximum return from the crop after it is produced depends on the care with which the potatoes are harvested, stored, graded, sacked and the ability of the grower to sell at the most advantageous time. Approximately one-third of the main potato crop is marketed at harvest time and the remainder is stored as a reserve supply for winter and spring. It is physically impossible, as well as economically undesirable, to attempt to market the entire crop in the autumn, and the only way in which potatoes can be handled successfully, so as to insure a uniform supply, is to provide sufficient storage on the farm or at the shipping station for from 65 to 75 per cent. of the crop.

Various types of storage places are now in use, ranging from pits or cheaply constructed dug-outs to large, substantially huilt storage houses,

The successful storage of potatoes involves their protection from extremes of cold and heat and their maintenance at a temperature of from 35 to 40 degrees F. Sufficient ventilation must he provided to remove foul air and excess moisture. The storage house must be so constructed as to exclude light, as the table quality of potatoes quickly deteriorates in the light. The tuhers must be dry and reasonahly free from dirt when put into storage, as an excess of moisture or soil increases the amount of heat generated in a newly stored supply of potatoes. The soil tends to close up the spaces hetween the tubers, thus cutting off air circulation and helping to retain heat that would otherwise escape. All diseased, badly cut or bruised tubers should be removed from the crop before putting it into storage. It is not advisahle to permit the stored potatoes in any bin to exceed a depth of 5 or 6 feet, and the floor dimensions of a single hin should not be greater than 12 by 12 feet unless it is provided with a series of ventilating shafts for the escape of moisture and heat. Ventilated division walls and floors are also desirahle.

Loss from Deep Storage

Some commercial growers and shippers of potatoes store in bins so deep that the tubers form a layer 10 to 15 feet thick. This is almost certain to entail a much heavier shrinkage loss than when stored at a depth of not more than 6 feet. The heavier shrinkage is the result of the greater amount of heat generated by a large pile of potatoes, which results in a higher moisture loss as well as a heavier loss from decay, as heat and moisture hoth help to develop organisms causing tuher rots. The loss under these conditions may reach 25 per cent., and where all diseased tuhers have not heen removed at the time of storing the loss may exceed that figure.

Potatoes stored throughout the winter season under conditions meeting the requirements suggested above should not sustain an actual loss in storage of more than 5 per cent., and under exceptionally good conditions it may he as low as 3 or 4 per cent. Assuming that 5 per cent, represents the average loss under good storage conditions and that 20 per cent. would be a fair average allowance under poor conditions, the actual monetary loss sustained hy the grower or dealer on 300,000 pounds of potatoes would in the one case he 5,000 pounds and in the other 60,000 pounds, or $1 a hundredweight, a loss of $150 under good and of $600 under poor storage conditions. Besides this there is an additional loss in storing potatoes to a depth of 10 to 15 feet which is not usually taken into consideration, and that is the mechanical injury through the cracking and bruising of the tubers at the bottom of the pile due to the great weight of the potatoes on top.

FIRE DONT'S

Don't allow anyone to smoke in your barn or your outbuildings.

Don't keep your automohile or your tractor in the harn, but provide a separate garage, which should not expose another building.

Don't keep gasoline except in closed safety containers. Never store quantities of 10 galls or more except in underground tanks or at least 150 feet from any building.

Don't hang up old clothes or oily rags in barn or other out-buildings except in metal lined lockers.

Don't allow steam engines without spark arresters near barn or other buildings.

Don't fail to provide lightning rods for every important building.

Don't burn trash, brush or rubbish near buildings. fences or other property, and nowhere except with greatest care

MILK STRINGY YET SWEET

Can you tell me what is the matter or what acuses milk and cream to look slimy or stringy when poured from one dish to another?—G. W.

Reply.—Stringy milk is caused by bacteria. Of course, sour milk is caused hy a bacteria hut a different kind. Lactic acid hacteria causes milk to sour, but the stringy milk hacteria causes it to become stringy while the milk is yet sweet. This hacteria gets on to the cow's teats and falls into the milk pail, and there germinates and develops. It can be done away with by washing the cow's teats and udder after milking, with a weak solution of sulphuric acid. The dairy utensils—skimming cloth, pails, etc., should also be rinsed with water containing a small amount of sulphuric acid. You will only have to give this treatment a few times to obviate the troubfe. This hacteria gets on to the cow's udder usually fro muddy pastures.

In Professor Sherman's class for teachers at Columbia University some one asked: "How long should a child keep up the use of milk" and he laughed and said: "Well, I should think that by the time he was forty, he might safely leave it off."

PRIZE WINNERS AT THE MARITIME WINTER FAIR

(Continued from page 195)

Oxfords

Ewe, 2 yrs. old and over—1, J. M. Laird & Son; 2 and 3, Burder Goodwin; 4, F. S. Black.

Ewe, 1 yr. and under 2—1, 3 and 4, Burder Goodwin; 2, F. S. Black.

Ewe lamb—1, 2, 3 and 4, Burder Goodwin.

Wether lamb—1 and 2, George L. Boswall; 3, F. S. Black.

Hampshires

Ewe 2 yrs. old and over—1 and 2, Agricultural College; 3, 4, 5 and 6, Cephas Nunn.

Ewe, 1 yr. and under 2—1, 2, 3 and 4, Cephas Nunn.

Ewe lamb—1 and 2, Agr. College; 3, 4, 5 and 6, Cephas Nunn.

Wether lamb—1, Cephas Nunn.

Suffolks

Ewe 2 yrs. old or over—1, 2, 3 and 4, Horne Bros.

Ewe, 1 yr. and under 2—1, 2, 3 and 4, Horne Bros.

Ewe lamb—1, 2, 3 and 4, Horne Bros.

Wether lamb—1, Horne Bros.

Grades or Crosses

Ewe, 2 yrs. old and over—1, E. Saunders; 2, Cephas Nunn; 3, Experimental Farm, Nappan; 4 and 7, George L. Boswall; 5, Jas. I. Stewart; 6, R. A. Snowball.

Ewe, 1 yr. and under 2—1, Burder Goodwin; 2 and 5, Geo. L. Boswall; 3, E. Saunders; 4, Oliver Saunders; 6, Albert Boswall.

Ewe Lamb—1, Cephas Nunn; 2, Oliver Saunders; 3 and 5, Geo. L. Boswall; 4, Jas. I. Stewart.

Yearling Wether—1, Oliver Saunders; 2, E. Saunders; 3, Cephas Nunn; 4, J. M. Laird & Son.

Wether Lamb—1, Geo. L. Boswall; 2, Oliver Saunders; 3, Experimental Farm, Nappan; 4, E. Saunders; 5, Cephas Nunn; 6, R. A. Snowball.

Special Prizes offered by the Live Stock Branch, Federal Department of Agriculture

Best group of 5 shearlings, ewes or wethers—1, E. Saunders; 2, Geo. L. Boswall; 3, Albert Boswall; 4, Burder Goodwin; 5, Cephas Nunn; 6, C. S. Stewart & Son.

Best group of 5 lambs, ewes or wethers—1 and 3, Geo. L. Boswall; 2, Burder Goodwin; 4, Cephas Nunn; 5, Experimental Farm, Nappan; 6, R. A. Snowball.

Best group of 10 shearlings, ewes or wethers—1, Oliver Saunders.

Best group of 10 lambs, ewes or wethers—Jas. I. Stewart; 2, F. S. Black; 3, Oliver Saunders; 4, R. A. Snowball; 5, Geo. L. Boswall.

Donated by the Bank of Montreal, Amherst, N. S., for the best 4 lambs, all one breed, in classes 31 to 40, inclusive, 1st, $8.; 2nd, $7.—1, Jas. I. Stewart; 2, Burder Goodwin.

Donated by the Canadian Bank of Commerce, Amherst, N. S., for the best 3 shearling wethers—1, Oliver Saunders.

Donated by the New Brunswick Wire Fence Company, Moncton, N. B., 40 rods of wire fencing for the best collection of sheep, all one breed and owned by one exhibitor—1, Jas. I. Stewart.

Donated by the Royal Bank of Canada, Amherst, N. S., for a pen, including 1 ewe lamb, one yearling, 1 ewe, 2 years old or over, 1st, 10 dollars; 2nd, $5.—1, George L. Boswall; 2, S. C. Stewart & Son.

DRESSED SHEEP CARCASSES

Dressed sheep carcasses from sheep over 1 year and exhibited in foregoing classes—1, Oliver Saunders; 2, S. C. Stewart & Son; 3, Jas. I. Stewart; 4, Oliver Saunders; 5, J. M. Laird & Son; 6, Geo. L. Boswall.

Dressed carcasses from sheep under 1 year and exhibited in foregoing classes—1, Oliver Saunders; 2, 3, 4, 6, R. A. Snowball; 5, Jas. I. Stewart.

Best group of three yearlings—1, Oliver Saunders.

Best Group of three lamb carcasses—1, R. A. Snowball; 2, Oliver Saunders; 3, Jas. I. Stewart; 4, Geo. L. Boswall; 5, R. A. Snowball.

WOOL PRIZES

Long Wool, Lamb (Hogg) fleece—1, S. C. Stewart & Son; 2, S. L. Boswall.

Long wool, sheel, (wether fleece—1, Albert Boswall; 2, S. C. Stewart & Son.

Medium Wool, lamb (Hogg) fleece—1, E .Saunders; 2, John H. King & Son.

Medium Wool, sheep, (wether fleece)—1, J. E. Semple; 2, Oliver Sounders.

CHAMPIONSHIP

Best Long Wool fleece—S. C. Stewart & Son.

Best Medium Wool ueece—E. Saunders.

SWINE

Yorkshire

Barrow, six months and under 9—1 and 2, George Boswall; 3, A. J. Vessey; 4, S. C. Stewart & Son.

Barrow, under 6 mos.—1, Geo. Boswall; 2 and 3, George Holmes.

Sow, 9 mos. and under 15—1, Hiram E. Black.

Sow, 6 mos. and under 9—1, Geo. Boswall; 2 and 5, S. C. Stewart & Son; 3 and 4, Bert R. Brown.

Sow, under 6 mos.—1 and 2, Roper Bros.

Berkshires

Barrow, 6 mos. and under 9—1, Peter Brodie; 2 and 3, Jas. I. Stewart.

Barrow, under 6 mos.—1, Peter Brodie; 2 and 3, J. R. Semple.

Sow, 9 mos. and under 15—1, Peter Brodie; 2, Logan Bros.; 3, Jas. I. Stewart.

Sow, 6 mos. and under 9—1, 2, 3 and 4, J. R. Semple; 5, Jas. I. Stewart.

Sow, under 6 mos.—1 and 2, Logan Bros.; 3 and 4, J. R. Semple.

Grades of any breed

Barrow, 6 mos., and under 9—1, E. J. Vessey; 2, George Holmes; 3, 4 and 5, H. S. Pipes & Son.

Barrow, under 6 mos.—1, Fowler Bros.; 2 and 3, A. E. Dickie; 4, George Holmes.

Sow, 9 mos. and under 15—1, Harley Smith; 2, H. S. Pipes & Sons.

Sow, 6 mos., and under 9—1 and 2, Fowler Bros.; 3, H. S. Pipes; 4, Chas. Etter; 5, E. J. Vessey.

Sow, under 6 mos.—1, E. J. Vessey; 2, Harley Smith; 3, Geo. Holmes; 4 and 5, A. E. Dickie.

Special Pries offered by Live Stock Branch, Federal Department of Agriculture

SWINE

Finished Bacon Hogs any Breed or Grade

Best Group of 3—1, Bert R. Brown; 2, S. C. Stewart & Son; 3, Fowler Bros.; 4, J. R. Semple; 5, A. E. Dickie; 6, Logan Bros.

Best Group of 5—1, George L. Boswall; 2, E. J. Vessey; 3, J. R. Semple; 4, George Holmes; 5, H. S. Pipes & Son.

Donated by Dominion Swine Breeders Assoc. Open to Nova Scotia.

Best Sow, 9 mos. and under 15—1, Hiram E. Black.

Best sow, 6 mos., and under 9—1, J. R. Semple.

Best sow, under 6 mos.—1, Logan Bros.

Open to Prince Edward Island

Best sow, 9 mos. and under 15—1, Peter Brodie.

Best sow, 6 mos. and under 9—1, George Boswall.

Best sow, under 6 mos.—1, Roper Bros.

Grand Championship

Silver cup donated by Atlas Stock Food Co. for best animal, any breed or grade, judged from a bacon standpoint, quality and conformation to count equally, won by George L. Boswall.

LIVE POULTRY

Anconas, cock.—1 and 2, G. H. Seaman.

Hen.—1 and 2, G. H. Seaman; 3, Chas. H. Smythe.

Cockerel.—1, Alfred Springall; 2, G. H. Seaman; 3, Aubrey Jackson.

Pullet.—1, Alfred Springall; 2 and 3, G. H. Seaman.

Andalusians, hen.—1, Mrs. Frank Locke.

Cockerel.—1 and 2, Mrs. Frank Locke.

Pullet.—1 and 2, Mrs. Frank Locke.

Braham, Light, cock.—1 and 3, Day Bros; 2, Chas. Smythe.

Hen—1 and 2, Day Bros.; 3, Chas. H. Smythe.

Cockerel.—1, Day Bros.; 2 and 3, W. L. Lowe.

Pullets.—1, Day Bros.; 2, Chas. Lowe; 3 and 4, Mrs. Frank Lowe; 5, Day Bros.; 6, W. L. Lowe; 7, Chas. Lowe.

Brahma, Dark, cock—1 and 2, Day Bros.

Hen—1 and 2, Day Bros.

Cockerel—1 and 2, Day Bros.

Pullet—1 and 2, Day Bros.

Black Spanish White Face, hen—1 and 2, Stanley Carter.

Cockerel—1, Stanely Carter; 2, John P. Bain.

Pullet—1, John P. Bain; 2, Stanley Carter.

Campines, Golden, hen—1. John P. Bain.

Cochin Partridge, cock—1, Day Bros.

Hen— 1and 2, Day Bros.

Dominiques, cock—1, John P. Bain.

Hen—1 and 2, John P. Bain.

Dorkings, Silver Grey, cock—1 and 2, Day Bros.

Hen—1, John P. Bain; 2and 3, Day Bros.

Cockerel—1, John P. Bain; 2, Day Bros.

Pullet—1, Day Bros; 2, John P. Bain.

Dorkings, White, hen—1, John P. Bain.

Game, Black Red, cock—1 and 2, John A. Scott.

Hen—1, John A. Scott; 2, Stanley R. Seaman.

Cockerel—1, Donald Keith.

Pullet—Donald Keith.

Game, Indian, cock—1, J. W. Gould; 2, S. R. Seaman.

Hen—1 and 2, Chas. Lowe; 3, John P. Bain.

Cockerel—1, Chas. Lowe; 2, John P. Bain.

Pullet—1, Chas. Lowe; 2, Stanley Lowe; 3, Chas. Lowe.

Game, Pyle Standard, hen—1 and 2, John A. Scott; 3, Donald Keith.

Pullet—1, John A. Scott.

Leghorns, Brown, R. C., cock—1, John A. Scott; 2, Geo. Holmes.

Hen—1, John A. Scott; 2, George Holmes.

Cockerel—1, and 2, John A. Scott;

Cockerel—1, and 2, John A. Scott.

Pullet—1 and 2, John A. Scott.

Leghorns, Buff, S. C., cock—1, C. F. Clarkson.

Hen—1, C. F. Clarkson.

Cockerel—1, C. F. Clarkson; 2, E. I. Peel.

Pullet—1, E. I. Peel; 2 and 3, C. F. Clarkson.

Minorcas, Black S. C., cock—1, W. J. Cudmore; 2, Alf. Mollin; 3, W. J. Cuudmore.

Hen—1, W. J. Cudmore; 2, Robt. & Gordon Carter; 3. W. J. Cudmore.

Cockerel—1, Alf. Mollin; 2 and 3, W. J. Cudmore; 4, John A. Scott; 5, W. C. VanBuskirk; 6. E. I. Peel.

Pullet—1 and 2, W. J. Cudmore; 3, and 4, Alf. Mollin; 5 and 6, W. C. Van Buskirk; 7, Alf. Mollin.

Minorcas, Black, R. C., cock—1, John P. Bain.

Hen—1, John P. Bain.

Pullet—1 and 2, John P. Bain.

Langshans, cock—1, O. J. Taylor; 2, Chas. H. Smyth.

Hen—1 and 2, O. J. Taylor; 3, Chas. H. Smyth.

Cockerel—1 and 2. O. J. Taylor.

Pullet—1 and 2, O. J. Taylor.

Orpingtons, Buff, S. C., cock—1, A. Vye Gibson.

Hen—1 and 2, A. Vye Gibson.

Cockerel—1 and 2, A. Vye Gibsch.

Pullet—1 and 2, A. Vye Gibson.

Orpingtons, White, Any Variety—cock—1, Mrs. Frank Locke.

Hen—1and 2, Robert and Gordon Carter; 3, Mrs. Frank Locke.

Cockerel—1 and 2, B. W. Ralston.

Pullet—1, Mrs. Frank Locke; 2. B. W. Ralston; 3, Mrs. Frank Locke.

Orpingtons, Black any variety, cock—1, Camp Hill Poultry Yards; 2, Geo. Holmes.

Hen—1 and 2, Camp Hill Poultry Yards.

Pullet—1, Camp Hill Poultry Yards.

Plymouth Rock, Barred, cock— 1, T. C. Latham; 2 and 3, Alfred Springall.

Hen—1, Aubrey Stevenson; 2, Watson Lutz; 3, 4, 5, and 6, T. C. Latham; 7, Watson Lutz.

Cockerel—1 and 2, Kentville Poultry Yards; 3, 4 and 5, T. C. Latham; 6, E. I. Peel; 7, Watson Lutz.

Pullet—1, 2, 3, 4, 5, and 6, T.C. Latham; 7, Aubrey Stevenson.

Plymouth Rock, cock—1, Albert Boswall; 2, Samuel Steeves.

Hen—1, Albert Boswell; 2, Samuel Steeves; 3, G. B. McPherson.

Cockerel—1, Albert Boswall; 2, Samuel Steeves; 3, G. B. McPherson.

Pullet—1, Albert Boswall; 2 and 3, Samuel Steeves; 4 and 5, Chas. Simmons; 6, Samuel Steeves; 7, Allison Lutz.

Rhode Island Reds, S. C., cock—1, W. H. Henry; 2, Mount Pleasant Poultry Yards; 3, W. H. Henry.

Hen—1 and 2, W. H. Henry; 3, Mrs. Frank Locke.

Cockerel—1 and 2, W. H. Henry; 3, C. B. McMullen; 4, 5 and 6, W. H. Henry; 7, E. F. McKim.

Pullet—1, C. B. McMullen; 2, W. Retson; 3, W. H. Henry; 4 and 5, C. B. McMullen; 6 anl 7, W. H. Henry.

Rhode Island Reds, R. C., cock—1, W. H. Henry; 2, Mrs. Frank Locke.

Hen—1, W. H. Henry; 2, Mrs. Frank Locke.

Cockerel— 1, 2 and 3, W. H. Henry.

Pullet—1 and 2, W. H. Henry; 3, Carl Fowler.

Red Caps, cock—1, John P. Bain.

Hen—1 and 2, John P. Bain.

Cockerel—1, John P. Bain.

Pullet—1, John P. Bain.

Sussex, Speckled, hen—1, A. A. Sutherland.

Cockerel—1, A. A. Sutherland; 2, C. F. Clarkson.

Pullet—1 and 2, A. A. Sutherland.

Wyandottes, Golden, cock—1, David Babcock.

Hen—1 and 2, David Babcock.

Wyandottes, Buff, cock—1, Wm. Beazley; 2, W. S. Swetman.

Hen—1, Wm. Beazley; 2, W. S. Sweatman.

Pullet— 1, P. J. Rose; W. S. Swetman; 3, P. J. Rose.

Wyandottes, White, cock—1, Evaneline Poultry Yards; 2 3, and 4, Samuel steeves; 5, Eveangeline Poultry Yards; 6, Samuel Steeves; 7, E. I. Peel.

Hen—1, 2 and 3, Sumuel Steeves; 4 and 5, Evangeline Poultry Yards; 6, Carl Fowler; 7, J. H. Gould.

Cockerel—1 and 2, Samuel Steeves; 3, 4 and 5, Odbur Jones; 6 and 7, J. H. Gould.

Pullet—1, Samuuel Steeves; 2, Odbur Jones; 3, Samuel Steeves; 4, Odbur Jones; 5, Robt. and Gordon Carter; 6, Odbur Jones.

Wandottes, Columbian, cock—1 and 2, Cicle Church.

Hen—1 and 2, Cicle Church.

Cockerel—1 and 2, Cicle Church.

Pullet—1 and 2, Cicle Church.

Wyandottes, Black, cock—1, Camp Hill Poultry Yards.

Hen—1, Camp Hill Poultry Yards.

Cockeerl—1 and 2, Camp Hill Poultry Yards.

Pullet— 1 and 2, Camp Hill Poultry Yards.

Wyandottes, Partridge, cock— 1, John Feetham; 2, C. E. Casey, Jr.

Hen—1, John Feetham; 2, C. E. Casey, Jr.; 3, John Feetham.
Cockerel—1, 2 and 3, C. E. Casey.
Pullets—1, 2 and 3, C. E. Casey.
Wyandottes, Silver Laced, cock—1 and 2, E. S. Brown.
Cockerel—1 and 2, E. S. Brown.
Pullet—1 and 2, E. S. Brown.
Wyandottes, A. O. V., cock— 1, Day Bros.
Hen—1, E. C. Griffin; 2, Day Bros.
Cockerel—1, E. C. Griffin; 2, Day Bros.
Pullet— 1 and 2, E. C. Griffin.

LIVE UTILITY POULTRY

Wyandottes, White, pair of cockerels—1, E. I. Peel.
Pair of Pullets—1, Courtney Lusby; 2, E. I. Peel.
Wyandottes, Silver, pair of pullets—1, E. S. Brown.
Wyandottes, Buff, pair of cockerels—1, Wm. Bezzley; 2, W. S. Swetnam.
Pair of Pullets—1, Wm. Beazley; 2, W. S. Swetnam.
Wyandottes, Columbian,Pair of Pullets—1, Cicle Church.
Plymouth Rock, Barred, Pair of Cockerels—1, Warren Black; 2, Alex. Clegg; 3, T. C. Latham.
Pair of Pullets—1, Alex Clegg; 2, W. E. B. Tait.
Plymouth Rock, White, pair of Cockerels—1, Chas. Simmonds.
Pair of Pullets—1 and 2, Chas. Simmonds 3, G. B. McPherson.
Orpingtons;, Buff, pair of Cockerels—1, A. Vye Gibson; 2, Elwyn U. Harrison.

DAIRYING.

SHOULD COWS BE GIVEN MEAL THIS WINTER?

With bran at $45 per ton, oats at 90 cents per bushel, and oil cake close to $100 per ton, it is little wonder that dairymen are wondering whether or not they can afford to feed these h priced concentrates this winter. the investigation recently conducted into the high cost of living it was found in almost every case that the extreme high cost of millfeeds was the insurmountable obstacle in the cost of milk production. When the Board of Commerce had the milk business of Montreal under consideration a short time ago they were unable to fault the figures brought forward by Prof. H. Barton, of Macdonald College, and finally accepted the price asked for by the producers as fair. However, it is interesting to note that in the figures submitted by Prof. Barton as to the cost of producing 100 pounds of milk which amounted to $3.84, that $1.54 of that amount was made up of millfeed costs. The concentrates were figured at a flat rate of $70 per ton, that being the actual cost of the feeds used in the herds under investigation. Can the average dairyman afford to feed such high priced feeds at a profit

Taking these figures as they stand it does not require a great deal of figuring to find a place for the other $2.30, with hay at $20 per ton, silage and roots at $5.00 or over, and labor, to say nothing about the various overhead expenses, etc., that are particularly prevalent in dairy farming. Prof. Barton allows almost 34 pounds of meal to 100 pounds of milk which practically speaking means the product of two cows. Seventeen pounds of meal per cow must be regarded as fairly heavy feeding and it is just a question if it would no pay the average dairyman better to sacrifice a little in the milk yield and save upon the meal raton. A moment's reflection wil lbe sufficient to bring out the fact that the increase in the price of roughages has been greatly outstripped by the rise in concentrates. It was not in years gone by an unheard of thing for hay to bring twelve and fifteen dollars per ton, and a general average, taking one year with another would run it around $10 per ton. Today double that price is perhaps a little high. The same thing is true in the case of roots and ensilage. $3.00 used to be a common figure for calculation and $5.00 is the one taken today. But what about concentrates? Oats are selling around 90 cents per bushel unground, and barley is considered good buying at $1.45 for 48 lbs., while oil cake and cotton seed meal have reached $90 and $100 laid down to the farmer.

Roughly speaking concentrates have advanced anywhere form 140 to 150 per cent. or better, while the coarser home-grown roughages have only in a few cases reached a figure double that of pre-war times. Naturally then, if these figures were anywhere near a par basis in pre-war times, they are decidedly out of balance today, and theoretically speaking if expensive concentrates could be cut out altogether milk production today would be a profitable business.

In practise the above is not possible as the cows must have a balanced ration in order to produce milk in any quantity, but at the same time it is quite possible to feed a herd in such a manner that they will produuce a reasonable amount of milk without an exceptionally heavy allowance of meal. In that regard the maximum use must be made of good quality roughages such as ensilage, roots, clover or cereal hay. An extra allowance of these cheaper feeds will generally be found to produce milk at less cost than when a more highly concentrated and expensive ration is used. Of course, there is a limit to the amount of substitution possible and a great deal will depend upon the amount and quality of the roughage used. Next to roots, ensilage and clover hay, there is nothing better than well cured cereal hay. That is a mixture of oats, peas and barley, cut green and cured as hay. It is almost as good a feed as choice alfalfa, and when fed to dairy cows will produce milk in abundance. In the matter of yield per acre it has few equals, while at the same time it does not prevent the field from being seeded down to grass and clover. In short it makes an excellent cattle feed, and when combined with good quality roots and ensilage it has few equals for dairy cattle feeding.

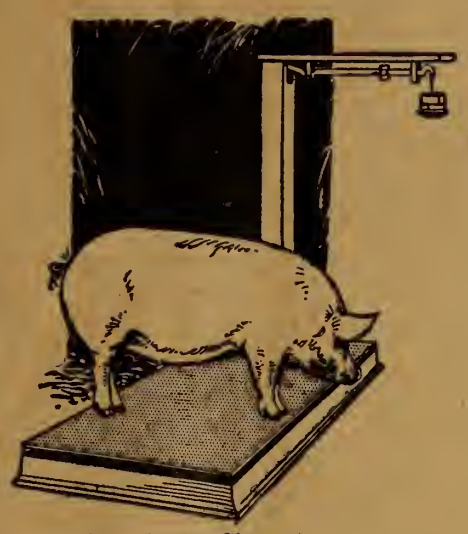
Granted, therefore, that the above points are well taken, is the average dairy farmer justified in feeding a heavy meal ration this winter? The answer will, of course, depend upon local conditions, such as the character and quality of roughage available, and the price being obtained for the milk. In some instances such as in the case of pure bred cows that require developing or are under test, stinting the meal ration would be very foolish, but in the case of ordinary dairy cows it seems hard to figure out where the farmer is going to make money of even break even by feeding a heavy concentrated ration at present prices. Bran is costing the farmer well on to $50 per ton this winter and oil cake is

"Show me the Cows!"
Not a Load
Just a Handful
HINMAN
CANADA'S STANDARD MILKER
H.F. BAILEY & SON, MFRS., GALT, ONT.
Dairymen using Hinman Milkers increase their Herds!
Why? Because dairying immediately becomes more profitable and less laborious.
Half a million cows are milked with Hinman Milkers daily. Big dairy farms use it on prizewinners.
Any farmer owning eight or more cows can profitably use a Hinman. Cost per unit is only $60—you can't afford to be without.
Facts, figures and photos in illustrated booklet on milking—free for the asking.
2

around $90 per ton and hard to get, while cotton seed meal, although quoted on the market at around $85 per ton, costs the farmer a sum close up to three figures. Taking these figures as a basis for calculation the amount of digestible protein and starch equivalent that can be purchased for $1.00 in each of the various feeds is a great deal greater in the case of oil cake and cotton seed meal than in any of the others. The price per ton is high but the feeding value is also high, and in the end it is the cheapest source of protein, which is the main constituent necessary in concentrated foods. In the case of the ground screenings now being sold by the Federal Live Stock Branch under the name of "Standard Stock Feed" at $46 per ton, we are not in a position to pudge, not being informed as to the quality of the same. If the quality is good and weed seeds not too plentiful, it looks like good buying, but of course it all depends upon the quality. Weed seeds are not good cattle feed, in some cases are poisonous and must be used cautiously.

However, in view of the above arguments and viewing the situation as it appears today, this much at least seems certain—that the best use should be made of roughages and the ration balanced up as much possible by the use of high-testing protein feeds such as cotton seed, oil cake and glutten feed. The prices being obtained for milk just now do not seem to justify the feeding of heavy meal rations in order to maintain the maximum production except in special cases.—Ottawa Farm Journal.

Feed for the Quality Prices!



The Scales Show the Quality Feeders

HOG feeding has made rapid strides just the same as everything else on the farm. The old-fashioned method of utilizing mill feeds that happened to be easy to get at low prices, or happened to be handy on the spot, is gone forever. Both experts and farmers now know it pays handsomely to feed an accurately and properly mixed ration. Experiment and experience have shown that careless feeding is one of the causes of poor quality bacon. The markets are demanding higher quality standards. There are attractive profits if you can reach the standards required. You can do it with

Monarch Hog Feed

It is a perfectly balanced ration of corn products, shorts and digester tankage—a rich feed, but not too much so to feed alone.

It gets hogs to market in shortest time, at least cost of production. It means heavier hogs sent to market in best condition for selling. It is easily digested. Hogs fight for this palatable feed. Guaranteed analysis: protein 15%, fat 4%.

Mill feeds are often hard to get, but Monarch feeds—ready for use—are always obtainable. Order a ton from your dealer. If he cannot supply you, write us direct, giving dealer's name.

MONARCH DAIRY FEED
has guaranteed analysis of 20% protein and 4% fat. It is a properly mixed combination of Oil Cake Meal and Cotton-seed Meal with the bulky feeds, bran and corn meal. Thougb very rich, ensuring splendid results, it can be fed alone.

SAMPSON FEED
This general purposes feed is somewbat similar to Monarch Hog Feed, except that oil cake meal is used instead of digester tankage; it gives results for both cattle and hogs. Guaranteed analysis: 10% protein and 4% fat.

The Campbell Flour Mills Co., Ltd., West Toronto 15

WINTER DAIRYING — DOES IT PAY? SOME ARGUMENTS IN ITS FAVOR

The first essential in profitable dairying is good cows, the second is year-round dairying. A combination of these two generally brings happy results and the man who can so arrange his activities as to bring that about seldom has any regrets for pinning his faith to dairy farming. Such a combination has several advantages, and apart from the financial consideration there are some points that bear heavily on the side of dairying the year round.

In the first place if the cows are to be profitable they must milk close up to ten months each year, and even if they do freshen in the spring there is more or less winter dairying to be done. They must be fed, and apart from the short period in which they are dry, feeding is almost as expensive as if they were milking. Of course it is quite possible to carry dry cows over winter very cheaply, but that is not a profitable way, and with good cows it is nothing short of disastrous. Heavy producing cows must be well fed at all times and it is beyond all doubt that if the dairy cows of this country were better fed there would be fewer men going out of dairying. If the cow does not receive a sufficient amount of good wholesome feed during the winter months she must make up for it during the summer, with the result that the first few weeks on pasture are devoted to building up the body rather than the production of milk. Therefore, since the cow must be fed why not have her freshen so as to produce milk throughout the winter months and pay for that feed? It will require more expensive feeding it is true, but the extra price received for the milk together with the additional amount produced will more than make up the difference in the cost of feed. It is a well-known fact and one that is borne out by study of the records of the cows that have quolified in the Record of Performance that cows that freshen in the fall or early winter produce more milk and fat than those that freshen in the spring. They produce well all winter and when turned out to pasture in the summer they take on another spurt and for a while they milk almost as well as spring freshening ocws. In that way their production does not drop on account of weather conditions because they are almost at the end of their lactation period when the flies become troublesome.

On the other hand there is the labor situation to contend with, and in that regard preference must be given to winter dairying. During the winter months there is more time to care for the herd than in summer thereby resulting in greater milk production to say nothing of the great advantage to the calves and young stock by reason of that greater attention. All this tends towards greater profits from the herd and at the same time it means a better and more even distribution of labor, less milking during the busy harvest season and affords profitable employment for men throughout the entire year, and in most cases to the extent of being able to engage a married man and furnish him with a house. Right here is the whole secret of why extensive dairymen have less trouble keeping men do their fellow farmers who milk their cows in the summer months only. They are able to employ them twelve months of the year and do it profitably.

Apart from the above argument comes the question of marketing, which in reality is the deciding question as to the advisability of engaging in winter darying or not. If one is so situated that milk or cream cannot be shipped to some city, creamery or condensery, and there are no local cehese factoris or creameries operating throughout the winter months, winter dairying is almost impossible. However, in Central Canada, at least, such conditions are the exception rather than the rule, and the districts that are so isloated as to be unable to obtain acesibility to markets are few and far between. For the inhabitants of these sections the summer cheese factory is the only alternative, and probably it suits them as well as any other. They receive less money, but their expense is also less, and in the end perhaps their profits are just as great. But that argument does not justiiy the dairy farmer who has the advantage of a convenient market from ignoring the advantages of winter dairying, yet they can be found in almost every district, not excluding those in close proximity to Montreal, the greatest milk market in Canada. It seems hard to understand why such farmers continue to ignore the advantages of winter dairying and the city milk trade. They have the cows, equipment, etc., already, but they continue to crowd almost all their farm work into the few short summer months, with the result that they are always in labor difficulties. For the latter there are two reasons. One is that they cannit employ their hired menn all year, and the second is that they do not obtain enough money to pay the wages asked. Wherein lies the remedy? The writer may be wrong, but he is inclined to place a large part of the blame upon the continued practice of summer dairying. At any rate this much is true, and it must be quite apparent to anyone who has studied the dairy situation in Canada, that the dairy farmers who today own the best homes, are the most prosperous and happy, have the least labor diffiulties and own the best cattle are in almost every case the farmers who are engaged in winter dairying. There must be some reason. It undoubtedly costs more to produce winter milk, but the increased price obtained makes up the difference and leaves a fair margin of profit on the year's business.

WINTER HOUSING OF SWINE

In providing shelter for swine during the winter months the chief consideration is dryness. Other points such as warmth and ventilation are important and closely related, but the absolute essential is dryness. Buildings heated by the warmth of animals have a great tendency to excessive moisture because the warmth comes chiefly from the animals' breath, which is moisture laden. An excessively moist atmosphere is detrimental to the health of an yanimal, but to pigs it is particularly objectionable as they are more subject to rheumatism and other troubles traceable to dampness.

Wintering in Piggery. The brevity of this article will prevent any full discussion of piggery construction but a few essentials may be noted. Cement floors are the best from the standpoint of sanitation and durability, but a pig should never lie on a cement floor.. Sleeping platforms should be provided. These may be raised only an inch or two above the cement or may be elevated so that there is a two story pen with a gangway up to the sleeping quarters. Cement should not be used for piggery walls; it makes a damp building. Wooden walls with plenty of insulation by means of paper and dead air spaces are best. A piggery should have ample sunlight, and the rays should shine on the sleeping quarters keeping the bedding dry and sweet. The area of glass should not be extreme, however, as that defeats the object, making the building too hard to warm and consequently damp. The ceiling of a piggery should not be too high; a low ceiling allows the place to warm up more readily and facilitates ventilation. A good system of ventilation should be installed such as the Rutherford system or a straw-filled loft with slatted ceiling may take the place of the foul air vents.

Wintering in Straw Pile. Where straw is plentiful, pigs may be wintered quite successfully in a large pile of straw. A start at a burrow in the straw should be made for them by threshing the pile over a clump of bushes, some home-made trestles, a fence or other obstacle that will make a hollow place in the centre of the pile and a runway out from it. The pigs will then burrow from this and make their nests.

Where the amount of straw to be used is not unlimited, the same kind of shelter can be made with much less straw. The shelter place should be surrounded by a fence and roofed over with poles. A second fence should surround this at a distance of at least six feet. Straw is then perched in the intervening space and piled over the top. A crooked entry passage at the south side will allow the pigs to come in and out without too much direct draft entering the pen.

Wintering in Cabins.—Pigs can be wintered quite comfortably in the ordinary cabins used for providing shelter on pasture in summer. Where the location is well drained and the climate dry, these cabins are better without floors. The pigs work the soil into a fine dust which makes an excellent warm bed. Floors up a distance from the ground have a cold draft under them and are likely to be wet from the pigs' urine unless bedding is changed frequently. However, on level locations and in wet climates, where the earth would be muddy, it is necessary to put in a wooden floor. Where this is done the cabin should be well banked wtih earth or manure so that the cold air cannot blow under the floor, and dry bedding given whenever needed. The ordinary A-shaped cabin is found very satisfactory at Brandon and is cheaply and quickly made. A cabin with straight walls and shingled roof is more durable but considerably more expensive. Two or more of these cabins may be placed in a row and the space between filled with straw. Straw should be piled against the sides of the end cabins. It is advisable to keep the pigs away from this straw or they will tramp is down and carry it into the cabins. An odd length of woven fencing is quite suitable for this purpose.

Brood sows wintered in such shelters as above described, are found to winter better than in the most elaborate piggery. They have to take exercise in coming out for food and their quarters are always dry. They will produce larger and stronger litters than are possible from sows wintered in limited quarters no matter how comfortable the latter may seem to be.

W. C. McKILLICAN,
Superintendent, Experimental Farm,
Brandon, Man.

Shorthorns

The Breed For You

Shorthorn steers hold the high-price record for a carload on the open market in Canada. They also hold the high-price record for carlots of heavy steers, yearlings and feeders on the American open markets. They are money makers.

FLUSHING BREEDING FLOCK OF SHEEP IN THE FALL OF THE YEAR

Much of the weakness and unfitness of sheep to do well under ordinary good care is due to the condition of sire and dam at mating time and subsequent treatment of the dam throughout the winter. The annual mortality of pregnant ewes is a most serious matter and could largely be prevented by proper care and management. That also is true of the loss of little lambs from ill-treated ewes that manage to survive. Before a lamb can have a good start it must have good parents and both of them must be kept in good health and condition.

Flushing the Ewes

"Flusing," is a term given to extra feeding at mating time. To insure strength in the dam and her lamb "flushing" should be done before mating time and until the mating season is over; then the ewes should be properly fed and managed in winter. Flushing consists in allowing the ewes, a specially saved pasture, which will be fresh and green from fall rains. On such grass the ewes quickly pick up in flesh and get their bowels in proper condition. In addition to green grass, clover, alfalfa, or rape it is well to feed some grain to ewes that are not in good flesh and strong condition. A mixture of whole oats and bran, in equal parts, will be found suitable. Start with a quarter of a pound per ewe daily, and increase to half a pound if the ewes are not thriving sufficiently.

Where flocks are treated by flushing or specially treated in the manner described, the percentage of barrenness among ewes is less than with those untreated. These facts are well known to flock-masters and farmers who have consistently practised the methods of liberally treating their sheep during mating time.

Flushing the Ram

To secure strong and healthy lambs, it is equally necessary to "flush" the ram. He should be prepared for the mating season by "flushing," in a paddock of his own. He should not be allowed to run with the ewes to overserve, and so weaken himself and the lambs he begets. Where the unprepared ram is allowed to run with the ewes he will serve too often; be sure to run down in consequence and beget weak lambs. This is the unsuspected cause of weak lambs in many a flock.

It is a harmful custom to allow the ram to run with the ewes the whole twenty-four hours of each day. He will stand around with the ewes and neglect his feeding. A study of their habits will reveal the fact that mating largely takes place at night. The ram should be taken from the ewes during the day and be liberally fed, and only let out to the ewes during the night. If the fertility of the female is as sensitive to the feeding as results have proven, then would not that fertility be accelerated by the proper nourishing of the ram, which cannot be done by allowing him freedom of the ewes day and night. The ram will soon get accustomed to the usage, and seek his paddock by day for his extra feed. Have him tame and quiet, so that he can be easily handled and can be caught in the field.

Twins Instead of Single Lambs

A good deal of attention has been given in sheep rearing countries to the fertility of ewes and the increase in the number of lambs. One of the best tests as to the utility of flushing in giving greater increase of lambs at birth, as well as uniformity of good health, is to be found in the history of the Blackfaced Highland sheep in Scotland. It is one of the sights of that country in the fall to see the flocks of sheep migrating in millions from the mountains to the lowlands. The ewes are brought at breeding time, down to the lowland fertile pastures of the arable farms. The placing of the flock of ewes upon superior pasture, and looking after them well in the winter months, always result in an increase in lambs. The fertility of the Highland Blackfaced sheep is the lowest of all breeds, and experiments tried in order to raise fecundity in this breed are increasing. One lamb per ewe is the usual occurrence at lambing time, but as high a percentage as 160 lambs per 100 ewes has been attained by special treatment. A case came under the writer's notice where 60 ewes were put upon rape and grain at breeding time, and 50 of these had twins, and 4 had triplets. The ewes were taken promiscuously from a flock that averaged less than one and half lambs to each ewe the previous year, and their fertility in the number of lambs far exceeded those from the same flock that weer differently treated.

Inherited Fertility

Fertility is a character that can be inherited, and breeders of every class of live stock about the farm, as well as the experienced students of plant life, bear testimony to the truth of this statement. Farmers who go in for exhibition or for selling ram lambs for breeding are often satisfied with singles at a birth, simply because they get a better specimen of animal to suit their purpose, but there are few, if any, flock-masters who do not prefer twin lambs to singles, even though the latter be better nourished.

When Scottish sheep breeders first

What Should an Engine Weigh?

Abraham Lincoln was asked how long a man's legs should be and he replied, "they should be long enough to reach the ground—and no longer." An engine should weigh enough to do its work—and no more. Years ago it was necessary to cast engine parts very large and heavy, with heavy base and flywheel, or the violent explosions and fast and slow speeds of the old-style engine would tear it to pieces.

Six years ago the Cushman Motor Works designed a new type of farm engine weighing about one-fifth as much per H. P. as other farm engines, but so well built, balanced and governed that it ran more steadily and quietly than a farm engine was ever known to run. Some people laughed, and said that an engine weighing only 190 lbs. must be a toy, but when they saw the Cushman at work beside heavy engines weighing five or six times as much, they realized that weight does not mean power, and that the Cushman is a giant in power for its size.

Cushman Light Weight Engines

40 to 60 Pounds per Horse Power

4 H. P. Weighs Only 190 lbs. 15 H. P. Weighs Only 780 lbs.
8 H. P. Weighs Only 320 lbs. 20 H. P. Weighs Only 1200 lbs.

Cushman Engines have Throttle Governor and Schebler Carburetor, insuring regular speed even on jobs of irregular loads, like sawing. Their perfect balance also helps to make them steady, insuring unusual durability and freedom from engine trouble.

Besides doing all other farm work it may be used as Binder Engine.

The 4 H. P. and the 8 H. P. are mounted on trucks, if desired, and may be pulled around by hand. These are very useful engines, as besides doing all work heavy engines do, they may be attached to machines in the field, as 4 H. P. on grain and corn binders and 8 H. P. on hay balers. All engines over 4 H. P. are double cylinder, which means steadier power.

The Cushman is not a cheap engine, but it is cheap in the long run. Engine Book free.

Before Buying Any Engine
Ask These Questions

How much does it weigh? If it weighs more than 60 lbs. per horsepower, why?

Is it throttle governed? A throttle governor insures steady, quiet economical power.

started to introduce the Down sheep of England into their herds, they found they were largely single bearing. Single bearing is not more common with Down breeds than with long-wooled, but the reason for single bearing in the Scottish imported stock was due to the flock-masters of England offering their prize-taking and best-looking sheep at the sales, and these invariably were single lambs. A large percentage of the ram lambs on offer at all sales are singles; they are stronger and are chosen by the seller in order to command more money, while the fertile lesser animals is disposed off to the butcher.

Sheep that are bred from twin-bearing parents will on the average bear twins each succeeding year. This has been found to be the general rule amongst sheep whose fecundity is naturally of a higher order, but amongst cattle of a more single bearing tendency twin-bearing only appears in each successive second generation. The system of keeping records of twin-bearers, even among the small flocks around the farms, may seem an insignificant matter, but collectively it would be of great national importance to the industry.

It must be observed, however, that overfeeding is prejudical to fertility. In a like manner a low condition of the system, especially if the animal is exposed to wet and cold, is often a cause of temporary barrenness. Climatic conditions have a marked influence on fertility. If a snowstorm occurs at breeding time and sheep are exposed to it, there is a diminution in the number of twin lambs. The breeding animal, therefore, should be kept in a condition in which all the functions of the body are perfectly performed.

MILKING CAPACITY OF SOWS

The business of the brood sow is to produce good sized litters of strong, healthy pigs and nourish them liberally until weaning time. In so far as she fails in this, she fails in the purpose for which she is kept. This milking function in the sow is a matter that should be given greater consideration by all who raise pigs, whether few or many.

In cattle there are well known milking strains in all breeds and the value of a cow for use in the dairy depends rather more on individuality than on breed; furthermore, the capacity to give a large quantity of good milk is well understood to be a transmissible quality. The ready recognition of these facts in cattle is largely owing to the fact that we are in the habit of seeing the product of the cow in one mess in the milk pail and can judge and compare her performance with that of other cows and that we have the same opportunity to judge of the performance of a good cow's calf. In the case of the sow we only see the results and we don't always trace them to their true cause. We know that large numbers of little pigs die young after struggling along trying to make a living of it and that a great many more do struggle through and manage to survive after a fashion, although greatly stunted. These results are known and are ascribed to various causes, some of which are true, but very often the real though unsuspected reason is merely that the dam did not have milk enough for the litter or that the quality was not sufficiently nutritious to sustain the pigs. This is a fault in a sow for which no excellence of blood lines will compensate.

It matters not how good the sow may be in every other respect, if she cannot give milk of good quality and plenty of it so as to push her pigs from the start, she is not of much account as a brood sow. One may blame the bad results that follow her farrowing time on a bad "nick" in mating or on laik of care and proper feeding during the period of gestation or on cold weather when the litter comes, or on other causes that interfere with success, but, after all, in numerous cases the trouble simply is that she does not make milk enough to keep the pigs growing properly after they are born.

The hog is grown with a view of making meat, it is bred with the idea of putting on flesh largely and speedily. This being the case the females of a race bred with that view have to be watched with special care in regard to the milking function, for putting on flesh and making milk are habits of constitution that are rather inconsistent and are not likely to be found highly developed in the same animal. We need only to go to dairy experience for evidenec of this.

The principal test of whether a sow is a good milker or not is the thrift of her pigs and her condition while suckling them. If they do well and she eats liberally and keeps up good health and digestion and at the same time gets a little thing while nursing them, it is pretty good evidence that she is a good milker and will do to keep as long as her usefulness lasts. But look out for the sow that fattens between farrowing and weaning time. Her pigs either die off soon after birth or become runts for she is not making the use of her feed that a good milker and mother should make. It will be found that the milking habit runs in families. Some dams can give but little milk and can't produce a sow pig that can give much milk, while others almost invariably have sow pigs that make good milkers and mothers. The latter are born for motherhood just as the former only have motherhood thrust upon them.

A. O. CHOATE.

COWS THAT ARE HARD TO MILK

I have several cows that are very hard to milk. What is the cause and how can it be remedied? G. B. R.

There are two causes of this trouble. The first and most common cause is an abnormally tight sphincter muscle at the orifice of the teat. A less frequent cause is a stricture of the teat canal or a small growth in the canal. The first cause can usually be removed by a simple surgical operation. There is also an operation for the trouble when the condition is due to a stricture of or growth in the teat canal; but the results are not always so successful as in the former case.

A competent veterinarian who will carefully carry out the necessary antiseptic precautions should always be employed to perform either operation as there is considerable danger of infecting the udder unless such precautions are taken. If the operation is properly done there is little danger of udder infection and the results are practically always successful when due to a tight sphincter muscle and many of the other cases may be greatly benefited by operation.

In the improvement of beef cattle care has been taken to develop most those portions of the body from which are obtained the high priced cuts of beef. These points should be kept in mind when selecting breeding animals.

CANADIAN PIONEER STOCK FOODS

The solution to run own cattle, horses, hogs, sheep and poultry. They build from the source---the digestion---they tone and regulate the system

In winter when the stock are in close quarters, they cannot obtain the nourishing green pastures and lose out on the necessary protein, fats and carbo-hydrates to keep them in the best condition.

THE HORSE

WEANING THE YOUNG COLT TO CONSERVE VIGOROUS LIFE

While horses of all ages and conditions require special care at all times, it is especially necessary during the early periods of the existence of the young horse. As he grows older he becomes habituated to the conditions of life and manner of care that are thrown about him so that he is better able to withstand any adverse circumstances that may come to him. But it is entirely different with the young animal which has had the benefit of only a short experience, and a condition which may seem to be quite insignificant to the onlooker, may be sufficient to sap the health and spirit of the animal all its life time. This is specially true at weaning time.

The Time to Wean

A strong colt may be weaned at five months but if it is at all possible it will be better to let it run six months with its dam. To secure the best results, the young colt should be taught to eat grain and should also be halter broken previous to the training period. They can thus be grain fed by themselves, making the weaning process less difficult. There is always danger in allowing a foal to feed itself from the grain ration of its dam, as it will be liable to get too much, and be overfed while still getting milk. The feeder is the only man who knows hiw much food the colt will require for its growth and development. The individuality of the animal is what counts in feeding. There is no feed superior to a mixture of bran and oats, and the average rate of two pounds per day per hundred pounds of live weight is considered sufficient. But the eye of the feeder is the guiding rule. One thing imperative is that a colt should never get more than it will clean up at a feeding. Nothing will run down a foal faster than allowing stale food to collect in the boxes, and mangers from one feeding to the next. The digestive system needs rest at all times. The colt should never lose the foal flesh but should be gaining from birth to maturity on the kinds of feeds suited to its needs.

Training Before Weaning Time

The loss of flesh and condition at weaning time may be reduced if the colt is taught to eat before it is weaned. It is not the best practice to feed the colt large quantities of grain while the mare is giving plenty of milk, but rather get it accustomed to small amounts. Teach it to stand tied, so that it will not fret when taken away from its dam. Colts that are accustomed to being fed and tied are much easier to manage during weaning time.

Bowel trouble may also come at weaning time unless great care has been taken to provide for the change which this time makes necessary. At the commencement of the weaning the colt should be getting practically all its nourishment from hand feeding, supplemented by its mother's milk. As it is gradually deprived of the latter, there should be no change made in its other feed except to gradually increase the grain. If the colt, before weaning, has had the run of the pasture, do not confine it to the barn on dry feed. If it has been otherwise fed, do not suddenly change it from dry feed to pastures. Bowel trouble is almost always caused by sudden changes in the feed either in variety or quantity, or by the use of unsuitable or impure feeds or bad water. If studied care is taken to avoid these unwise practices, bowel trouble will seldom bother.

A colt that is stunted during the first winter never makes as good a horse as it will if fed a liberal ration of grain and kept in good flesh throughout the first winter season. It is even of gerater importance that the colt should grow more rapidly the first season than the second. A small feed of carrots every day is good for the colt, but do not overdo the carrot feeding; one or two good sized carrots per day will be sufficient. Never forget that the colt needs salt. Colts are liable to be troubled with worms, and a good plan to keep this trouble under control is to mix up equal parts of sulphur, ground gentian, and dried sulphate of iron. To this mixture add an equal quantity of salt. Keep this mixture in a dry place where the colt can have constant access to it. In this way, while the colt is consuming salt it also gets a small amount of the drugs mentioned, which will prevent worms and other similar stomach troubles.

When Colt is Taken from it's Mother

When the foal is taken away from its dam, put it in a box-stall that is well ventilated. The stall will afford it more exercise than a single stall, but do not think it will furnish enough opportunity for exercise; the foal must be turned out every day when the weather will permit. It should not, however, be sent out to be left exposed to rain or wet snow storms. It will be better off in the barn on cold, wet days. Dry cold, however, will not hurt it. Keep the stall clean. Manure that is allowed to lie and ferment in the stall is injurious to the colt's feet. Keep the stall well bedded, and remember that even if the colt is allowed plenty of out-door exercise it is still under artificial conditions and consequently is not apt to wear its hoofs off as rapidly as they grow. If the toes are allowed to get too long and the heels too high, the colt is apt to sustain permanent injury.

Some prefer to wean colts abruptly —that is, to take them away from the mares and not allow them to suck after that at all, while others prefer gradual weaning by allowing them to run to their mothers once per day for a week or so, milking them to some extent previous to allowing the colts to suck, and in that way gradually the milk supply is cut down. The writer has all along adopted the plan of taking the colt away, and never allowing it to again get milk from tis mother. By this method the colt will forget its mother sooner, and become more quickly settled to adjust itself to the new feeding arrangement. If it has never been taught to eat by itself and has not been handled or halter broken, the sudden change away from the mother will cause serious loss to the foal flesh and growth. Weaning is thus a slow training process, and it should be conducted in such a way that the final parting of colt and dam does not cause any serious break in the constitutional life of the colt.

At this time also the food and udder of the dam require extra attention. Work the mare right along if she has been at work but reduce her grain ration till she is dried off. When the udder becomes so full as to cause her uneasiness, part of the milk should be drawn, but she should not be milked dry. If the milk is all withdrawn each time it will take longer to dry her. When the udder swells up even when milked, it should be bathed once a day with cold water and a little spirits of camphor. Spirits of camphor dries up the milk glands.

Healthy growth is the most valuable quality of the colt, and to tis preservation the owner or caretaker should give his first and most careful attention. From weaning time until it is full grown it should have plenty of bone and muscle-forming foods, and be given the run of a good pasture at all times when the weather is favorable.

CAUSE AND TREATMENT SWOLLEN LEGS, GREASE AND CRACKED HEELS IN HORSES

Horses during the fall season are very subject to swollen legs, indeed it is a very common complaint. Occasionally when the horse does not seem to labor under any other disease

A Halter Guaranteed Unbreakable

You can soon discourage the toughest puller you'll ever have in your stable, when you tie him with a Griffith Broncho Buster. It's one of the strongest halters made—guaranteed to hold any horse for a full year from date of purchase.

Griffith Guaranteed Halters

Look for the Griffith Guarantee tag before buying a halter. The Broncho Buster was designed specially for the Western farmers, to hold those mean, wiry bronchos—and it does hold them. If you have a horse that can break or pull out of a Broncho Buster within a year from the time you buy it, we'll send you another free.

Broncho Busters are sold by dealers at $2.75 (in the West $3.00). If your dealer can't supply you, send direct to us, giving dealer's name.

Get our Halter Book. There's a halter in it for the wildest horse in your stable and for the gentlest. Your dealer will give you a copy or drop us a card.

the hind legs commence suddenly to swell to an enormous degree from the hock to fetlock, attended by heat and extreme tenderness of the skin, accompanied by a peculiar lameness. It occurs in young horses, and in those which are overfed and little exercised, wtihout any previous illness. It is this appearance, without any apparent illness of the animal, that causes apparent surprise to many inquiries. The kind of swollen legs of most frequent occurrence is that which appears when the horse is seemingly in perfect health, and has a full allowance of food, while suffered to remain for days without exercise. The arteries and their capillaries convey a great deal of fluid to the extremities. As a result of over-feeding and the want of exercise, and the perspiration connected with it, the fluids accordingly accumulate, lodging in the extremities because of the inabilty of the vessels to return them. The want of exercise deprives the limbs of the principal power by which fluids are returned. The blood is materially assisted in its return through the veins by the action of the muscles and the absorbents are aroused to action by the exercise and motion of the different parts.

Horses taken from pastures in the fall and brought into close stables very speedily have swollen legs. The same happen in the spring time. The powers of the constitution are principally employed in providing a new coat of har for the animal, and without having additional care and exercise to increase blood circulation there is the usual clogging up of fluids at the extremities.

The Indiscriminate use of Diuretic Medicines

The horse is more subject to gatherings of fluid in particular parts than any other domestic animal. Swollen legs is a disease peculiar to him. The great idea with the average man who owns horses is to give an animal affected with swollen legs large quantities of diuretics, that is medicines to excite the secretion of urine.

The indiscriminate use of diuretic medicines such as nitre, turpentine, and digitalis, etc., is the cause of more harm than good, but unless they are prescribed for the patient, the average man thinks there can be no cure, or that the disease is not understood by the vet. who is called to examine the animal. But there is one medicine that will effect a cure where the animal is still kept under the same conditions, that gave rise to the disease. It is just possible that giving medicines while the animal is in the midst of surroundings that produced the disease, may increase rather than check the disease. The frequent use of diuretics is one of the absurdities of horse management. Not only are the kidneys so often over-excited, weakened and therefore disposed to disease, but the whole frame becomes debilitated, for the absorbents will carry away a great part of that which is necessary to the health and condition of the horse, in order to supply the deficiency of blood occasioned by the inordinate discharge of urine. By seeking to remove these humors, by the imprudent use of diuretic medicines, a horseman is only attacking a symptom at consequence of disease, and not the disease itself. The legs will fill again, while the cause remains, the effect will be produced.

The cure is to give more exercise, to walk the horse out daily when the usual work is not required, and by some mechanical means to supply to the extremities the want of the motion of the parts, and the consequent urging on of the return fluid. Friction by hand rubbing is an excellent means at least for a time. Bandages have a greater and more durable effect, for nothing tends more to support the capillary veins, and rouse the action of absorbents, than moderate pressure. If the swelling bids defiance to exercise and friction and bandage, the aid of diuretics may be resorted to, but never until these have failed, unless there is an evident tendency to grease.

Grease

There is much bad practice done by the average horseman in seeking to cure a horse of grease. Swollen legs although distinct from grease, are apt to degenerate into it. Grease is a local complaint; it is produced principally by causes which act locally, and it is most successfully treated by local applications.

Physic may be useful in abating inflammation in the organs that control the humors and fluids of the horse's body, but to abate the inflammatory action which exists in the skin of the heel is to heal the wounds and remedy the mischief which it has occasioned.

The first appearance of grease is usually a dry and scurfy state of skin of the heel, with redness, heat and itchiness. The heel should be well washed with soap and water, and as much of the scurf detached as is easily removable. The part washed should then be well dried and rubbed once a day with an ointment composed of acetate of lead one ounce; sulphate of zinc, half an ounce; water, one pint. This will usually cool and heal the part. The disease very often arises owing to the poor condition of the animal, and he should therefore have a complete change of diet, supplying him with the best and freshest of hay, oats, some roots, and with the grain feed, a handful or two of linseed meal should be added daily. Comfortable and clean housing should also be provided, and once a week a moderate dose of aloes—about five drachms in a pint of water. An ounce of saltpetre should be placed daily in his bucket of water.

Cracks

When cracks appear, the mode of treatment will depend on their extent and depth. When slight, a lotion composed of a solution of two drachms of copper sulphate and four drachms of alum in a pint of water, will often speedily dry them up and close them. But when cracks are deep and a discharge is coming from them it will be necessary to poultice the heel. Linseed poultice may be used, also a carrot poultice is very effective in cases where poulticing becomes necessary. When the cracks have discharged a good deal of matter, and show signs of healing after poulticing, they may be dressed twice daily with a solution of subacetate of lead, one ounce; glycerine, eight ounces. Sometimes the legs will continue swollen after the cracks are healed, and for this a flannel bandage over the whole of the swollen part will be found very serviceable. No blistering should be done because of the danger of bringing back the inflammation of the skin and discharge from it.

A REMERY FOR WORMS IN HORSES

I have a mare that has worms. Can you advise a remedy? P. C. J.

Ans.—Give two ounces of turpentine in a pint of raw linseed oil and repeat twice at intervals of three days. This is for the ordinary round worms. For pin worms, which are found only in the last few feet of the bowels, an injection of a weak solution of creolin can be made. This can be repeated daily until no traces of worms are found.

Monsieur:

For 15 days in the month of January I was sufferering with pain of rheumatism in the foot. I tried all kinds of remedies but nothing did me any good. One person told me about MINARD'S LINIMENT; as soon as I tried it the Saturday night, the next morning I was feeling very good; I tell you this remedy is very good; I could give you a good certificate any time you would like to have one. If any time I come to hear about any person sick of rheumatism, I could tell them about this remedy.

Yours truly,
ERNEST LEVEILLE,
216 Rue Ontario East, Montreal.

POULTRY SELLING FAIRS

by G. R. Wilson, B.S.A., Dominion Poultry Repres. for N. B.

The present trend of the Poultry industry is toward eggs and more eggs. Governments, Associations and producers are emphasizing utility stock. But in order to get eggs, pullets are necessary. Since no poultryman has yet been able to detect sex before incubation and not definitely before the chicks are six to eight weeks old, it becomes necessary to rear approximately as many cockerels as pullets to keep the laying flock up to strength.

The turkey and goose industry the past few years has come into the foreground with the high ranging of prices. While roast chicken would prove a sumptuous meal in everyday life, people demand the turkey and goose for Christmas festivities. So it comes that more attention is being paid, and rightly so, to turkey and goose raising.

As a marketing method for all kinds of poultry the Poultry selling fair has much to commend it. It has been a marketing channel in Ontario for a considerable length of time. While popular in Ontario it has never been augurated in the Maritime Provinces until this year. On December 10th the first Poultry Selling Fair in N. B. was held at Port Elgin and met with great success. The prices received by the producers were above prices ever expected. Buyers and producers were brought directly in touch thereby eliminating the jobbers and middlemen with great satisfaction to both buyer and producer.

But while the fair was a monetary success, there is another feature that should prove of a great deal more benefit to the poultry industry in N. B. than an increase of prices. The condition in which poultry has been put on the market in the past has been anything but satisfactory. Cities and towns have demanded poultry with entrails removed. Not much attention has been paid to keeping qualities of poultry on the market or to freedom from disease. Birds have been scalded, torn and bruised. Some of the most unsightly birds the writer has ever seen have been seen on New Brunswick markets. Such marketing conditions have continued to exist in spite of all investigational information. Investigations by the Bureau of Chemistry of the United States Dept. of Agriculture prove that "undrawn poultry contrary to the general impression in some localities keeps better in cold storage and while passing through trade channels than does drawn poultry. Careful observation in a large number of shipments of both drawn and undrawn poultry, made under commercial conditions, showed that the undrawn poultry reached the consumer with fewer bacteria and with less chemical change in composition than the drawn poultry. The shipments were accompanied by the investigators from the time the poultry was killed, while en route on trains, and until placed in the cold storage warehouses, and after being taken out of the cold storage were followed while being handled by the wholesalers, commission men and retail dealers. Recording thermometers accompanied the shipments through their entire course, and the varying temperatures to which the shipments were subjected were recorded. Samples were taken from the shipments at the time the poultry was killed, at the time it entered cold storage, at intervals while in storage, at the time they reached the commission men, again when the shipments reached the retailers and finally when sold to the ultimate consumer. Bacteriological examination and chemical analyses were made of all the samples taken at the various stages. Changes as they developed were noted and studied. Comparisons were made of the samples taken from the undrawn poultry with samples taken from the drawn poultry. It was found that bacteriological and chemical indications of deterioration developed much quicker in the drawn poultry and as the shpments progressed through the various steps of commercial handling the differences in the signs of deterioration became more marked. By the time the shipment reached the consumer much of the drawn poultry was unfit for food. The experiments revealed that the drawing of poultry as practised commercially always resulted in the birds becoming contaminated with bacteria which caused spoilage. These bacteria multiply rapidly, and while their growth is checked by cold storage it is not entirely stopped. If it were practicable to draw poultry with the same precautions to avoid contamination that the surgeon uses in performing an operation—that is, with the use of sterile instruments and rubber gloves and under strictly scientific sanitary conditions, so that there would be no bacterial contamination in the process of drawing—the drawn poultry would be preferable to the undrawn. However, it is not practicable under ordinary commercial conditions to prevent some bacterial contaminations in the drawing of poultry. To produce this result a trained bacteriologist and highly skilled workmen would be required in every poultry-killing establishment. The cost of such a process would be prohibitive.

It is the opinion of the specialists therefore, that under usual commercial conditions, undrawn poultry will be much better than drawn poultry. The experiments under which this conclusion was based were conducted several years ago, but continued observation of thousands of shipments of poultry under ordinary commercial conditions since then has only served to strengthen the opinion of the specialists who made the original experiments."

Aside from the keeping qualities when we consider the proposition from a health standpoint, we find that health alone is adequate proof that poultry should be marketed undrawn. Traces of destructive diseases to which poultry are subjected can all be removed in preparing poultry for market according to the old haphazard methods. Tuberculosis affects the internal organs, chicken-pox affects the head, cholera in chickens and blackhead in turkeys and chickens affect the intestines. It can therefore readily be seen that a bird affected with any of these diseases can be dressed with entrails removed, head and shanks off, and the consumer be none the wiser.

The Port Elgin Poultry Fair proved beyond doubt that such fairs would go far towards improving market methods. At Port Elgin the poultry was displayed on tables, care being taken that excellent finished lots of turkeys, geese and chickens were displayed prominently and the attention of producers drawn to them. Everybody present had the opportunity of seeing the value of finish in these lots. All poultry was marketed according to the latest market requirements—that is, all poultry was undrawn, and absolutely no scalding permitted, shanks were left attached and heads removed from geese and ducks only.

While no effort was made to grade the poultry, the range of prices automatically did the grading. Lots of poultry poorly dressed or poorly finished did not sell so readily or at as good a price as did well dressed and well finished lots. There seems no doubt that such fairs would be a great stimulus to the poultry industry; would prove a suitable market for surplus stock; and would go far toward improving the methods in which poultry is at present being dressed for market.

starts to molt the following summer. To make successful winter layers the early hatched pullets should begin laying by November first, when the prices of new-laid eggs are high, and should continue to lay at the rate of 40 to 50 eggs a day per hundred hens until February, and thereafter at the rate of 60 to 75 eggs a day per hundred hens until molting time.

A good depth of litter covering the float will encourage the vigorous scratching necessary to replace the accustomed outdoor exercise. The active hen is most productive, and if the fowls are kept busy scratching for their grain the first few weeks they will begin laying sooner and will have little time to cultivate the unprofitable habits of egg eating and feather pulling. Wheat straw and shredded corn fodder are excellent litter materials.

In preparing nests and roosts, bear in mind that the light breeds, such as Leghorns and Campines, require six to eight inches of roost space and nests 12 inches square, while heavier fowls, such as Plymouth Rocks and Wyandottes, need 10 to 12 inches of roost space and nests 14 inches square.

As eggs are about 70 per cent. water, some arrangement should be made to supply the fowls with drinking water heated to a comfortable temperature. An ordinary two-part galvanized gallon fountain, filled with warm water and set upon a hot soapstone, will do this, or a larger fountain heated by a small lamp will solve the problem with a minimum of attention.

The greatest problem in producing winter eggs at a profit this season lies in the poultryman's ability to select from the available grains and feeds an economical ration that will stimulate laying. The following are the rations that have been used with great success, both in starting pullets to lay and in maintaining production:

Mash: One hundred pounds bran, 200 middlings, 100 ground oats, 100 alfalfa meal, 100 feet scrape.

Scratch grain: Sixty pounds corn, 40 oats.

The following methods of feeding are practised by many poultry keepers who are successful in producing eggs in the winter time: The mash is fed in open hoppers which are before the fowls the entire day. At ten a. m. a feed of moist mash is given—all the pullets will clean up in 20 minutes. Three times a week this wet feed is mixed with half its bulk of cooked mixture of equal parts by measure of pumpkin, cull potatoes and whole oats. The wet mash is seasoned lightly with salt and red pepper, with a heaping teaspoon of dry ground mustard to each 25 fowls.

Cooked rations of this nature give good success in starting pullets to lay. Cooking breaks up the bulky, fibrous feeds, which are now the cheapest and which form a high proportion of the ration, making them more nutritious and lessening the danger of indigestion.

Scratch grains should be given about an hour before the fowls go to roost, and the average quantity is about fourteen pounds to the 100 layers. Scratch grains being high in price, hens should be encouraged to eat greater quantities of mash, the grain ration being only given once a day. Corn has been found to be indispensable for maintaining health and egg production in cold winter weather.

Self feeding hoppers should be procured to supply grit, oyster shell and charcoal. Given comfortable quarters, layers will produce more eggs, and with less feed if confined to the house continually throughout the winter than if allowed to run out in the snow and cold.

BUYING PURE-BRED PULLETS

A poultryman recently told me that he figured on pure-bred pullets being worth at least 75 to 100 per cent. more for breeding purposes than for market. This may be true, but there is a great variation in the value of pure-bred pullets and the birds are not of much value as breeders just because they are pure-bred. It is fundamental that the birds be pure-bred as a foundation. Then their value is built up according to their other characteristics.

One reason that some farmers are prejudiced against pure-bred poultry is due to some poor quality pure-breds they have seen. Some farmers who have culled their grade stock for years and kept only the best will never cull the pure-bred birds, but keep them all. A pure-bred flock should receive a culling and birds of inferior vigor sold on the market. Such birds are not worth 75 per cent. more than scrub stock just because they are pure-bred.

When buying pure-bred pullets we figure the value of the birds by the birds themselves. Some pullets are a poor investment at any price. Others might be a bargain at five dollars each. There can be no set rule for purchasing pure-bred poultry and no set price that will accurately determine their value. A pure-bred flock that has been bred for many years for either fancy points or egg production or both, is apt to produce pullets of great breeding value. They are worth more money than ordinary stock because of the blood lines. The qualities for which they are noted have been stamped on them by many years of careful breeding operations and they are able to produce progeny of like qualities.

A flock of pure-bred poultry might be carelessly bred with no effort made to select the best and most vigorous birds for reproduction. At the end of a few years the stock might be pure-bred and yet worth no more than the market value of scrub stock.

We do not like to buy pullets in large quantities as some poultry-men do. Usually it is the beginner who wishes to purchase a large number of pullets so that the dream of a large egg production can begin promptly. Frequently the pullets purchased do not come up to expectations. If pullets are purchased it is better to sacrifice quantity and buy a few first class birds as foundation stoc kfo rthe larger flocks which are to be raised at home.

The poultryman or farmer who raises his own pullets can cull them rigidly and keep the best. The others can be sold on the market if they are of little value as breeding stock. It does not pay to sell the cull pullets where they will be used for breeders, as too often it causes disappointment. When buying pullets, care should be taken not to purchase the culls from another breeder. Examine the pullets carefully. Find out their age and see if their development corresponds to their age. If possible study the breeding stock from which the pullets were produced.

Pure-bred pullets as foundation stock for poultry flocks should be worth at least seventy-five to one hundred per cent. more than scrubs. But do not stop there. tI also pays to classify the pure-breds and not buy foundation stock just because it is pure-bred. It must have other points of value to make it a profitable investment.

WATERING FOWLS IN WINTER TIME

In find it a very troublesome chore among my poultry in the winter time to keep them supplied with clean water, free from freezing. They spill the ordinary water dish, thus wetting the floor and litter. A fountain does not help, for in cold weather it makes more trouble than an ordinary dish.

P. C.

To overcome many of the troubles arising from watering hens in the winter time, the following home-made arrangement will be found very useful. Take a small wooden box, one side open, and fasten it with screws to one side of the hen-house, about four inches above the floor. Next get a large rectangular shaped bread tin that will hold about three quarts of water, that will fit neatly within the box. There should be four inches of space between the top of the tin and the top of the box; enough room for the hens to reach in and drink. The tin cannot be tipped over by the fowls and little dirt can get into it because of the box roof above.

Stand by the hen, handle her right, and she will lay eggs with all her might.

Make the hens work for what they get. Unless they have to scratch for their feed they become lazy parasites, just like folks.

SALESMAN WANTED

For Maritime Provinces. To commence at once, selling Shinn-Flat System of Lightning Protection. State selling experience.

SHINN MFG. CO. OF CANADA LIMITED
GUELPH, ONT.

FOR HOME AND COUNTRY

This Department will be utilized to the best interests of the homes in the Maritime Provinces. Subjects relating to household science and all that stands for better homes and communities will be published on this page. The editor, Mrs. M. A. MacLeod, Sussex, N B. solicits your assistance in making this page a success and will be glad to publish tested recipes, household discoveries and other articles useful to the homemaker and women's organizations.

"There is always a toast for the Future,
To the years that speed on ahead,
There is always a toast to the things that are new
To life's books that have never been read,
But here's to what lies behind us
To the heart aches, the failures, the tears
We are better able for just these things,
To drink to the future years."

THE MAKESHIFT

Lydia Arch sat in the wide verandah of her aunt's house studying a fashion journal which was already several months old. She was only trying to see how she could combine the fabrics of two dresses so that they would make one.

Two dresses had been left behind by one of the summer boarders with which Mrs. Arch filled her house from June to September. Lydia got most of her clothing that way and cost her aunt nothing, for she did the work of a servant without pay.

It took a great deal of material of any kind to cover Lydia. She was tall and rather heavily built. That was what was puzzling her now. Miss O'-Grady had been small, and, besides, trouble lay in the fact that the two colors were those Lydia hated—green and red.

The creak of wagon wheers came to her ears, and lifting her head she studied the road gravely. When a wagon and a silt-legged bay horse and a red-haired man came round the turn she only blushed slightly.

"I thought it was," she breathed to herself. "And I know where he's been out to Biddie's."

Her head dropped low over the page, but she did not see it. Instead she saw Cassy Biddle on the porch hammock, her arm behind her head in that coquettish way of hers, stealign longlashed glances at her lover, for Colin was her lover, and had been for a long time. His devotion and his patience were common topics of conversation. Aunt Abby said Collin was a fool to chase a worthless butterfly like Cassy Biddle. To Lydia she was the most charming of beings, and she did not blame Collin, even though he waited forever.

But why was he returning from Biddie's tonight at this early hour? She sighed and lifted her head to find that the bay horse had stopped, and Collin was standing with his hand on the bridle, motioning for her to come to him. She rose and went.

"I couldn't leave Crystal standing, and there's nothing to tie her to," he explained. "I've been driving her pretty fast. Don't you want to take a little ride with me?" Lydia could not have been more surprised. "Get in and take up the lines," he said. "She'll probably jump the moment I let go the bridle."

Lydia climbed into the runabout and gathered up the lines. She held the mare down, while Collin took his place beside her. To Lydia nothing cauld have been more delightful than guiding the beautiful, fleet mare along the smooth country road. She forgot her dressmaking perplexities—almost forgot Collin himself until he spoke:

"I've been out to see Cassy for the last time. What do you think of that?" he said.

Lydia did not speak, but her color faded.

"I was afraid it was going that way," Collin went on. "When Cassy and I got engaged she said if I wouldn't ask her to get married under a year she's be ready then. She wanted to earn her trosseau. Well, she's had time enough to earn six, and still she isn't ready. Of course, she gets good wages, and there's a lot going on in town, and I guess she has a pretty good time at the store, but still, I can't wait forever. Mother lies there in her bed helpless, and Mrs. Murray won't stay a minute longer than next week, and threshing's coming right on. I need a woman and now if ever. I—I've got to have a wife. You see that, don't you, Lydia?"

He looked at her, and Lydia looked back at him gravely. How was a man to work indoors and out the way they said Collin was doing It was too hard for him. He not only looked troubled, but worn out.

"Lydia, you will marry me, won't you?" he asked suddenly.

The lines twitched, and Crystal, mistaking the signal, started up. Collin took the lines. "There, I'll drive now," he said gently. "You think, Lydia; I'd be pleased if you should decide to marry me."

They did not speak again. Each was busy with thought too grave to be expressed. Lydia was trying to realize it all. Collin had asked her to marry him after she had thought Cassy Biddle had him forever. It did not seem true, and yet it was true. What could she answer but one word? A great happiness seized her. Her lips began to smile.

And Collin did not look at her until he was ready to leave her at her own door. Then he said, with another sigh: "Well, Lydia, have you made up your mind?"

Lydia smoothed back her crinkly hair. "Yes, I will, Collin," she said, and added seriously, "if Aunt Abby is willing."

Mrs. Arch was more than willing; she was delighted. After all, she had Lydia's welfare at heart, and she felt that it was a fine thing for the girl to be able to marry Collin Howe. She immediately began to make plans. "I'll make you a nice wedding, Lydy," she said. "And you shall have some clothes that oyu needn't be ashamed of. And Cassy Biddle shall be bid to the wedding to see 'em."

But Cassy Biddle did not come to the wedding, and Lydia looked very happy and shy in a white silk gown, which was the first becoming dress she had ever had.

Afterwards she went home with Collin to the farm house in the lane, where his mother lay ill and where Angie Clapp had done something in the way of "setting to rights." Two days later she was cooking for the harvest hands and doing all the work of the house alone.

This was no harder, however, than she had been used to doing during the busy season at Aunt Abby's, and very, very much more interesting. Collin had said to her at the outset: "We are partners now, Lydia. You know what that means. You go ahead and do just as you think best in the house. Don't bother me with it. I've got all I can do to look after the outdoors."

So Lydia looked after the house and was very content in being her own mistress.

Scarcely was the harvesting over when Collin's mother died. Collin grieved and Lydia was a great comfort to him during that time of sorrow. And then for the first time she was able to impress upon him the fact that she was a friend as well as a helpmeet.

"You're a good comrade, Lydia," he said. "I don't know what I'd do without you."

All this was very sweet to hear, and yet Lydia knew that there were times when Collin went into a room in his life and shut the door upon her. There was nothing she could do about it but stand outside and wait till he opened the door and came back to her, and never did he return without finding welcome in her eyes and a smile upon her lips.

Cassy Biddle did not come home once all that winter. Whenever her people wanted to see her they had to go to town to do so. She was so busy, Mrs. Biddle told Mrs. Arch. "Why Cassy was about the busiest person you ever saw in your life! She was the head of her department now—coats and suits—and earning splendid wages.

Spring came, and Collin told Lydia one day that he was going to town. At first he seemed to intend to go alone and then he asked Lydia to accompany him. "Must be something you want, Lydia," he said. "A new suit now. I believe you'd look elegant in a suit!"

"Well, have your own way' Collin,,' Lydia returned. So they went to town together.

Collin was very silent all the way. Lydia knew that he had been restless for a long time and that he was going to town just for the sake of getting a glimpse of Cassy Biddle. The suggestion concerning the suit for her was just another means to the end.

In the train she sat sadly gazing from the window. It was such a beautiful day and she could be so happy if only she had Collin's love. "I don't believe I shall ever have it now," she thought. "He isn't a changeable man and these first loves are awfully beguiling."

But by the time they had reached the city Lydia had conqquered her gloom. She entered the big store at Collin's side as composedly as though the new suit was all she expected to find inside. On the way upstairs she stopped at the millinery department to buy a hat."

"Go on, dear," she said. "I'll catch up with you. It will be tedious for you to wait round while I choose a hat and maybe you'll find someone to talk to."

"There, I've given him his chance," she thought. "Well, I had to. It wouldn't have been fair not to."

She was a long time getting the hat, then withit upon her head, she sought her husband. He was talking to Cassy Biddle, who seemed to be in a great flutter. Lydia shook hands with Cassy and tried not to notice Collin. Then the suit was mentioned and Cassy took her into one of the alcoves to try it on.

"This one is a good color for you," she said.

But Lydia had ideas of her own. She chose a quiet dark suit of severe tones. The suit fitted her and she decided to keep it on. As she emerged from the store she met Collin's eyes. He came forward eagerly.

"Why say!" he exclaimed. "Say, I didn't know you could look like that, Lydia."

His glance went past her to Cassy, but it did not linger. "Doesn't she look fine in that suit?" he demanded of her.

"Fine," echoed Cassy. But there was elasticity in her voice.

"Collin paid for the suit hurriedly.

PIMPLES and BOILS

For Nearly Two Years.

When pimples and boils appear on the face and body it seems as if the skin is the seat of the trouble. but the real disease is in the blood.

Lotions and ointments may allay the trouble for a while, but seldom if ever cure.

You have to get under the skin; get at the blood which is the cause of the trouble.

Burdock Blood Bitters goes direct to the root of the disease and restores healthy, normal action to the different organs, and cleanses the blood of all its impurities.

Mr. E. C. Goodwin, Cambridge, N.B., writes:—"For nearly two years I suffered from boils and pimples on my face and neck, and nearly all of my body was covered with the pimples. I tried most everything, but got no relief. One day a friend advised me to try Burdock Blood Bitters, and after using three bottles the boils and pimples had all left me and there is no sign of them returning. I can strongly recommend B.B.B. to anyone who is troubled with skin disease."

"We'll go somewhere now and find a bit of dinner," he said. "Good bye, Cassy. I'm glad to have seen you." He drew Lydia away.

In a nearby restaurant they sat down at a small table. Collin leaned his head in his hand and fell into deep thought. Lydia pretended to study the menu card. Suddenly he lifted his head. "Say," he said, "how Cassy has changed hasn't she?"

Just that. But Lydia knew. The door of the little room was open to her for the first time.

She smiled radiantly into her husband's admiring eyes.

Spanking Doesn't Cure!

Don't think children can be cured of bed-wetting by spanking them. The trouble is constitutional, the child cannot help it. I will send **FREE** to any mother my successful home treatment, with full instructions. If your children trouble you in this way, send no money, but write me to-day. My treatment is highly recommended to adults troubled with urine difficulties by day or night. Write for free trial treatment.

Mrs. M. Summers
Box 309 WINDSOR, Ontario

OUR CHILDREN'S TABLE MANNERS

Table manners, like most of the conventions are not arbitrary rule, they are based on common sense. Back of every breach of table etiquette lies either a parctical or an esthetic objection. A cup with a spoon left in it is apt to tip over. Biting one's bread instead of breaking it is suggestive of animals and therefore not pleasant to see.

How many parents teach the children not to smack their lips, not to lean their elbows on the table, not to be noisy at meals, and let table manners go at that. And when those children grow up, they learn the conventions at the cost of painful embarrassment and agonized self-consciousness.

A child of two is not too young to acquire the first principles of table etiquette. Explain to him the common sense of everything he must and must not do, and if, for one reason or another you allow him to break the rule, be sure that he understands what the proper thing really is.

All our teaching will be of no avail if we do not set him a good example. Grown-ups fall too easily into careless habits, secure in their knowledge that they know how to eat when they "go out." But the youngster carries his bad home habits with him.

There are children who seem absolutely incapable of keeping their fronts cleaan, without the aid of a napkin tucked in the collar or tied around the neck. If such be the case the mother is only courting trouble if she insists that he spread the napkin in his lap. Tell him that he must wear it "baby fashion" until he has learned not to spill his food as soon as he can eat nicely, he may spread the napkin, foided once, on his lap, in the proper grown-up way. This furnishes him an incentive for good manners.

Children fall into the habit of cutting up their meat into small pieces before beginning to eat, because, when they are very small, this is done for them by their parents. But as soon as a child can manage his knife, let him letrn to cut off only one piece at a time, "as mother and father do." It will save him embarrassment in later years.

In the same way, a child learns to butter a whole slice of bread and bite into it. When mother stops buttering it for him ,he imitates her method. into mouthfuls, each morsel bitten off, int omouthfuls, each morsel buttered separately. This is not difficult for children to learn. It is based on good sense—for a bite into a buttered slice is likely to leave greasy traces around the mouth.

In a large family of children, where there is much passing of plates for a "second help" from one to another, it is often the better part of valor to allow the owner of the plate to hold his knife and fork in his hand. A wise mother, however will begin early to teach youngsters that the proper way is t oleave the knife and fork resting on the plate, for well mannered people can supposedly pass the plate without accident. Let the kiddies look upon this, and other points, as a grown up privilege to which they may aspire, and they will need little urging to do their best.

When a knife or fork is not in use, it should rest wholly on the plate. At the end of the meal, the knife and fork should be placed together the ends touching on the plate, but not crossed.

The child should not be allowed to leave the spoon in his cup, for this is abad habit easy to acquire. Remember that everything you can drill into him now will save him future embarrassment. If for lack of patience, you have failed to teach him good manners, be sure that he will blame you at some later date.

Eating soup noiselessly is easier when the liquid is taken from the side of the spoon than when the spoon is sipped from the end. Also, it is not good manners to place the whole spoon in the mouth, which the child is likely to do when eating from the tip.

A child should learn not to pat his

We have already given away $5.000 FREE. $200.00 more IN CASH and numbers of Merchandise Prizes will be GIVEN AWAY at an Early date.

1st Prize, **$50.00** in Cash. 2nd Prize, **$40.00** in Cash
3rd Prize, **$35.00** in Cash. 4th Prize, **$25.00** in Cash
5th to 9th Prizes—Each **$10.00** in Cash.

TOGETHER WITH MANY MERCHANDISE PRIZES

Herewith will be fonnd the picture of a Log Hut in the Woods. At first glance all yon see is a man, a woman and a dog. If yon look closely the faces of 8 other persons will be found. Can you find them? It is no easy task but by patience and endurance can be accomplished.

You may win a cash prize by doing so. Many have done this as will be shown by the names and addresses which we will send you. If you find the faces mark each one with an X, cut out the picture and send it to us, together with a slip of paper on which you have written the words "I have found all the faces and marked them." Write these nine words plainly and neatly, as in case of ties, both writing and neatness are considered factors in this contest.

This may take up a little of your time but as TWO HUNDRED DOLLARS in cash and many merchandise prizes are given away, it is worth your time to take a little trouble over this matter. Remember all you have to do is to mark the faces, cut out the picture and write on a separate piece of paper the words, "I have found all the faces and marked them."

WE DO NOT ASK YOU TO SPEND ONE CENT OF YOUR MONEY IN ORDER TO ENTER THIS CONTEST

Send your answer at once; we will reply by Return Mail telling you whether your answer is correct or not, and we will send you a complete Prize List, together with the names and addresses of persons who have recently received over Five Thousand Dollars in Cash Prizes from us, and full particulars of a simple condition that must be fulfilled. (This condition does not involve the spending of any of your money.)

Although these persons are entirely unknown to us, they are our references. An enquiry from any one of them will bring the information that our contests are carried out with the utmost fairness and integrity.

Winners of cash prizes in our late competitions will not be allowed to enter this Contest.

This Competition will be judged by two well known business men of undoubted integrity, who have no connection with this Company, whose decisions must be accepted as final.

Your opportunity to win a good round sum is equally as good as that of anyone else as all previous winners of cash prizes are debarred from entering this contest.

food, or t omove itabout unnecessarily on the plate, for this is also a difficult habit to break, and one annoying to others at the table.

At many tables, chicken bones, chops, etc., are taken up in the hands. This is quite permissable at a family meal, but it is well to train the youngsters int oasking permission to "take it up in my hands" so that he may regard it as th eexception, not the rule.

A child should learn to cut lettuce with his fork, without aid of his knife. He should learn not to scrape the bottom of a cup, not to clash his spoon or fork against a plate in an effort to clean up every vestige of some favorite dish. If he must use a "pusher," let it be a piece of bread, not his fingers. He should avoid the habit of suspending a fork or spoonful in mid air while he talks. When food is taken from the plate it should be carried directly to the mouth. At the close of the meal he should fold his napkin and ask to be excused.

DRINK HOT WATER

The internal warm bath is as gratifying, cleansing, and generally satisfying, as the external one. There is nothing like a cup or two of hot water, taken half an hour or so before breakfast, to clear out the whole digestive tract and put it in readiness for its day's work. It makes one feel good all over, touching up the appetite, encouraging the body to an early performance of its natural features in the way of beneficent effects felt throughout the whole system.

Unless one is really ill, a cup taken just before going to bed is usually better than any medicine for which there is slight need, and a "course" of it will cure constipation without leaving the body dependent on drugs to more or less frequently help out.

If you feel sluggish and dull stop eating and drink hot water plentifully till your appetite tells you that you are all right again and ready for food. If there is gas on your stomach—drink hot water. If you feel a sick headache coming on—drink hot water and the heat will rout that chilly feeling and, if taken soon enough, rout the cold; while everyone knows that plenty of water is the best "medicine" for a cold already under headway.

To those who say that hot water is distasteful to them, I would suggest that they experiment until they find some addition that will make it agreeable to them until they can enjoy it "straight." A little cream or sugar or salt or phosphate or a slice of lemon, perhaps.

From some source, the body must have three or four quarts of water every twenty-four hours, to replace waste and insure health. Some of this we get in food and drink, but much of it should be clear water, and it will really be better if some of it is hot as a regular thing.

STERILIZING LINENS

If there is illness in the home, the most important thing to do is to thoroughly sterilize the linen, not only the bed linen, but all handkerchiefs, towels and everything with which the patient has come or is constantly coming in contact.

Blankets should be used over the sleeping sheets, for then they may be washed, as well as the sheets, pillow slips and other linen. First, it should be remembered that germs cannot rise from a damp surface. Germs have no means of flying about of their own volition; they have no legs to run with or crawl with or wings to fly with, nor do they need them, for when everything is dry the germs float with the dust on every breath of air.

The moment that linen is removed from a sick bed it should be put in cold water and kept there until time for washing. In water it becomes quite harmless and absolutely all danger from it is eliminated.

Practically all trained nurses today in private families know that linen put in water and kept in water will remain quite harmless. After the linen has thoroughly soaked the laundress may easily wash out the stains before putting such linen into the hot water for boiling, or before soaking in some germ destroying preparation. As a matter of fact no germicide is needed; a long and thorough boiling of this linen will serve that purpose and kill every germ that lurks in the folds or mesh of the cloth.

It is perfectly safe to handle such wet linen, unless there are abrasions on the skin of the hands, providing the person handling it does not get her hands on either her face or her clothes. As a double preventative rubber gloves may be worn by the laundress.

PRACTICAL HINTS FOR HOUSEWIVES

As a good substitute for linoleum take building paper, paint it dark brown or any good color wanted, as blue or gray. Have it cut into several lengths to fit the kitchen or dining-room where it is wanted, and lay it down. It will give excellent wear and does not cost as much as linoleum.

Do not throw away your old colored and black stockings; cut them in strips about one inch wide; start at the top and cut them round and round until you get to the bottom, then crochet with a wooden needle. This makes a good rug for bedroom or bath-room.

Flavor cream before whipping.

Wash and save your old quilts to pad new ones.

Scalloped rice with eggs makes a good main dish.

Never let silver stand over night without washing.

All yellow flame on the gas range is practically wasted.

Mice will not trouble a hole filled with any mixture containing lye.

A hot shovel held over varnished furniture will remove white spots.

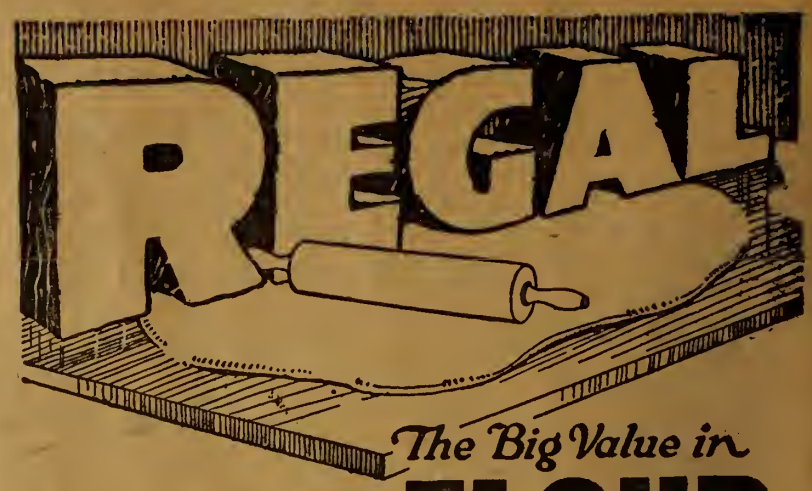
Turpentine put in corners of the wardrobe will do away with moths.

Peanut butter, creamed with lemon juice, may be used for cake filling.

If cut apples are placed in salt water for a few minutes they will not turn brown.

Pears baked and topped with raisins and marshmallow whip makes an excellent dessert.

Keep the table sugar in a large salt



The Big Value in
FLOUR

IN making tea biscuits and pastry, there is no flour that gives better satisfaction than "REGAL". Biscuit makers consider "REGAL" the BIG VALUE in flour.

Fawcett

NEW CHAMPION RANGE
A GREAT BAKER

Fawcett Ranges are the handsomest, most economical, durable, and satisfactory, as well as the best bakers.

Send for our booklet explaining why. It contains facts about ranges that you, as a housekeeper, ought to know.

CHARLES FAWCETT LIMITED
SACKVILLE · N · B · CANADA

shaker and you will be surprised how much you save.

The use of bread and butter plates is economical, because every bit of unused butter can be saved this way.

Use sewing scraps or newspaper in the kitchen for wiping out greasy dishes, thereby saving soap and hot water.

Hang your towels on a flat white enamel curtain rod. This prevents rusting and the sliding of the towels to the floor.

A measuring cup which holds exactly a half pint, and which is marked to indicate the half, quarter or third, is almost indispensable to the housekeeper who likes to vary her cooking and to try the new recipes which are given in the papers and magaines which she reads. In nearly, if not quite all of these, a cup means a half pint, and if a tea-cup is used it is largely a matter of guessing when the half or third has been filled. The mixing spoon may seem of small moment, but the spoon with a handle which is comfortable to hold, which is strongly made, and which has slits or openings in the bowl, will help very materially in bringing the batter to a fine, creamy consistency without unnecessary exertion.

CHRISTMAS THOUGHTS BY MASTER MINDS

We live in deeds, not years; in thoughts, not breathe; in feelings, not in figures on a dial. We should count time by heart throbs. He lives most who thinks most, feels the noblest, acts the best.—Philip James Bailey.

Nothing 'gainst Time's scythe can make defence save friendship.—Shakespeare.

Many happy years, unbroken friendships and cheerful recollections.—Dickens .

'Tis sweet, as year by year we lose friends out of sight, in faith to muse how grows in Paradise our store.—Keble.

AT CHRISTMAS TIME

But Christmas is not only the milemark of another year, moving us to thoughts of self-examination—it is a season, from all its associations, whether domestic or religious, suggesting thoughts of joy. A man dissatisfied with his endeavors is a man tempted to sadness. And in the midst of winter, when his life runs lowest and he is reminded of the empty chairs of his beloved, it is well that he should be condemned to this fashion of the smiling face.—Robert Louis Stevenson.

HELP THE NEEDY TO ENJOY CHRISTMAS

Some years ago a good woman organized a little society consisting of her nine-year-old son and all the other little boys in the neighborhood. She planned it on the lines of other organizations, as follows: Name, "Santa's Helpers;" moto, "Do it now;" colors red and green; flower, mistletoe. Object, to take Christmas cheer to the poorer families of our country.

A week or ten days before Christmas the first meeting was held and all the preliminary plans were made, the corn popped, cranberries strung presents wrapped and all the other things done that go to make a successful tree.

The day before Christmas the tree was decorated. On Christmas morning it was put in a wagon or float, and, with a Santa Claus as driver and all the boys as attendants, taken out two miles to the Poor Farm. Here Santa clipped the presents from the tree and the boys distributed them. The good was two-fold: it appealed to the better nature of the boys, and brought much happiness into the lives of a class of people who otherwise would get no Christmas cheer.

"The "Flu" Coming Back Are You Prepared?"

"HERE is an article about the "Flu." It says that the general opinion among physicians is that it will return this winter."

"Have they found a cure?"

"No. It seems that at the annual meeting of the American Medical Association, papers were read by physicians who could speak from authority on this subject. There was such a diversity of opinion on the effects of vaccination and innoculation, that these methods cannot be considered a success."

"What is a person to do then?"

"Well, statistics show that about three persons out of four are immune to the "Flu" germs. Investigations of a large number of cases makes it clear that this immunity from attack is due to the healthful condition of the system."

"In some districts 24 persons out of 1000 developed pneumonia from the "Flu." The germs of these ailments seem to thrive under similar conditions. If you are tired out and run down you are an easy prey to pneumonia germs, and the same applies to the "Flu" and other germ diseases. The thing to do is to keep fit."

"In what way?"

"By living according to the best hygienic laws, giving attention to diet and exercise and keeping the blood pure and rich, for, after all, pure rich blood is the greatest of germicides."

"When your digestive system fails to keep the blood rich there is nothing that will help you so much as Dr. Chase's Nerve Food. This treatment is composed of the elements which nature provides for the building up of the red blood corpuscles. By its use you are enabled to get your vitality up to high water mark and to keep it there. For this reason it is a wonderful help in the fight against all germs which threaten the human system."

Dr. Chase's Nerve Food, 50c. a box, 6 for $2.75, all dealers, or Edmanson, Bates & Co., Limited, Toronto. Look for the portrait and signature of A. W. Chase, M.D., the famous Receipt Book author, on the box you buy.

DISTRIBUTING THE CHRISTMAS GIFTS

Elizabeth Jerome

In the place of the Christmas tree, which is not always obtainable, try the following way of distributing the Christmas gifts. It is particularly good in a family where some of the children are reaching the age when the tree and Santa do not interest them.

Have each member of the family choose beforehand a favorite color—Baby's may be white—then let the respective packages be wrapped in tissue paper, or tied with ribbon or twine of the chosen color, of course labeling them as usual to prevent mistakes.

Then have them all hidden, here, there, everywhere, anywhere—even in auto or garage, where Daddy or Brother might be expected to enter during the day.

After breakfast, for it is too long and exciting a game to start before the morning meal, on with the hunt. No one must divulge the hiding place or touch the package of another—except for Baby—all can serve Baby.

Such shouts of joy and delight as each bit of personal color is spied and pounced upon. A gift has been known to turn up most unexpectedly even later in the week, making the fun last right on until New Year's. Until you try this novel distributing game, you don't know how much it will add to the festivities of the holiday.

Beef Juice

One-half pound lean, juicy beef cut in small pieces. Put in a wide mouthed bottle or jar, cover and set on stove in a kettle of cold water. Heat gradually and keep simmering two hours until the meat is white. Strain, press out all the juice and season with salt to taste.

DO NOT DISMISS CONSTIPATION AS A TRIFLE. IT IS NOT.

Half the ills of life are caused by allowing the bowels to become constipated.

When the bowels become constipated the stomach gets out of order, the liver does not work properly, and then follows the violent sick and bilious headaches, sourness of the stomach, biliousness, heartburn, water brash, or the painful, irritating internal bleeding or protruding piles.

Keep your bowels regular with Milburn's Laxa-Liver Pills and you need never be constipated.

Mrs. C. Henderson, Trail, B.C., writes:—"I have been troubled with sick headaches and constipation most all my life. Have not now been troubled for a long time. I have great faith in Milburn's Laxa-Liver Pills since using them."

Milburn's Laxa-Liver Pills are 25c. a vial at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

NEW YEAR RESOLUTIONS

How monotonous it would be if there were no ending or beginning to the years. If time rolled on and on with no milestones to count off the days, weeks, and months which make the year, how we would miss the "grand round up" when December makes her exit. "The door is shut,
The shadows of the old year fade
dimly o'er the hill
As past the threshold the New Year
with a smile is standing still.
He sees the dusty hallwayy, the rumpled cushions tossed,
He hears the dying echoes of varied
purpose crossed."

January the first marks the beginning of a new period of time and very general are the greetings of good cheer for the New Year. There is something so cheery and hopeful in the "Happy New Year to You." It makes us resolve that we will try to make it a happy "new one" indeed, that we will do less grumbling—a terrible habit that the most of us have a touch of; that we will be more charitable to our fellow men, more given to expressions of love and sympathy and less to unkindly criticisms, and if luck does seem against us and things go hard, we will endeavor to keep a stout hear.

"Do not look for clouds and shadows,
Watch for the sunshine day by day,
Let your tone be full of courage
Scatter gladness on the way.
Up and down the teeming present
Learn the dear and previous art,
How to meet both haps and mishaps
Ever with a cheery heart."

Saying good-bye to the old year and welcoming the new year makes it easy to form resolutions. Many do not believe in these resolves. They say they are only made to be quickly broken. Be that as it may, 'tis better to have even a transient ambition to mend matters than to go on with no hope or desire to improve. But to people who think truly and feel keenly the opening of another year which bespeaks an opoprtunity for greater diligence in all lines of mental and physical employment. Let us look back on the past year and say with Whittier:

"Rich gift of God,
A year of time."

And as we face the new year let us do si with the query:

"New Year, what have you brought us. Gifts for good or ill?"
"Take your choice," he answers,
"Be it as you will."
"Tomorrow's horn with patience
Benisons impart.
But there are no blessings
For a thankless heart."

Again, there is an historic dignity about the opening of another year, that awakens the hopes and inspirations. It is a pause in the passage of time, which arrests our attention and reveals opportunities either neglected or unthought of.

As I have said before, many say that they do not believe in making New Year resolutions. They may be mostly true and yet the very thought or desire on our part to wish to do better, shows we have a conscience not dead to improvement. Do you know, ladies, the resolve I would like us all to make, one possible to each, can we not resolve to take more real enjoyment from living. Think what this would mean to ourselves and to those around us, to be cheerful and happy. Not to go seeking pleasure but to find pleasure in the path we tread every day.

It does seem to me that we fail to taste the sweet of this life because our conception of what constitutes real happiness is distorted and unreal. We are looking above and beyond for something great and fail to see the lovely flower we crush under our feet, Oh, for the art of enjoying common place things! Oh, for the mind of John Ruskin. Ever capable of seeing the beautiful in every day surroundings.

Let us resolve to take delight in what may seem the trivial things of the passing day; the beautiful blue of the sky, or the soft gray of the winter clouds; the wonderful symetry and variety of form of the delicate snow flakes as they fall to the ground; the chick-a-dee chirping his merry chirp in the apple tree; the kitten runing around after its tail on the kitchen floor; the man running down the road after his hat which ever eludes his grasp; the prattle of teh children; the cackle of the hens; the good dinner we have today or the better one looked for tomorrow.

How blessed is the person who can see the funny side as well as the sunny side of life. We can cultivate this habit if we will. Then let us resolve to be happy and bright, to have a smile as well as a nod for the passer by, a loving as well as encouraging

When She Could Not Turn in Bed

DODD'S KIDNEY PILLS CURED MRS. WEBERG'S ILLS

Manitoba Woman After a Year of Suffiering Proves One Again that Dodd's Kidney Pills Help All Kidney Ills.

Rennie, Man., Dec. 20th (Special.)—"Yes, I feel as well as ever I did in my life and I give Dodd's Kidney Pills all the credit." The speaker was Mrs. E. Weberg, a highly respected resident here, who for some time was a severe sufferer from rheumatism and kidney trouble.

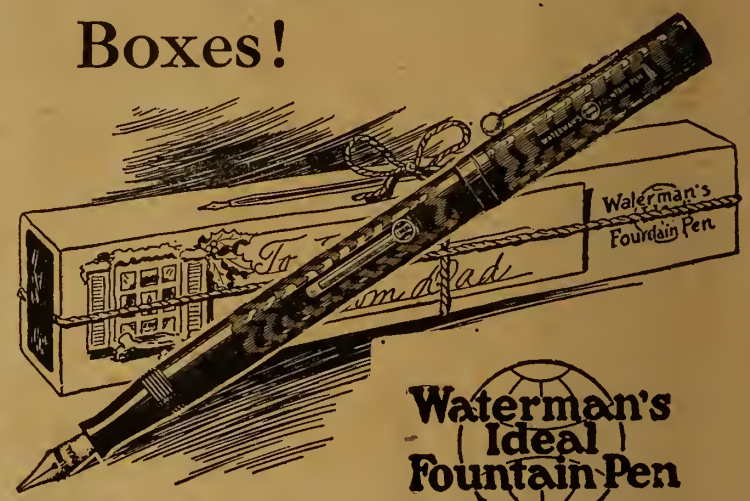
"My trouble started with a cold," Mrs. Weberg continued. "I could not throw off the after-effects. My sleep was broken, I felt heavy and sleepy after meals and I was always tired and nervous. Stiffness in the joints, cramps in the muscles and then headache, backache and heart flutterings followed.

"Then dropsy and rheumatism set in. I could not work on account of my sore back. I got so bad I could not turn myself in bed.

"I suffered for a year before I started to use Dodd's Kidney Pills. I used two boxes and now I feel as well as ever I did in my life."

Mrs. Weberg, wha looks the picture of health, struck at the root of all her troubles when she used oDdd's Kidney Pills. All her ills came from sick kidneys. Dodd's Kidney Pills are purely and simply a kidney remedy. Their record for the last twenty-five years is the cause of their popularity. Ask your neighbors about them.

The Very Best of Christmas Boxes!



Waterman's Ideal Fountain Pen

When in doubt, give a Waterman's Ideal Fountain Pen. It cannot fail to afford genuine satisfaction.

For Meatless Days

WHEN you want to save Time and Trouble—serve Pancakes. When you want to save cooking a big meal—serve Pancakes or Griddle Cakes. When the appetite balks at fish—serve Pancakes, or Griddle Cakes, or Waffles. But, at all times, when you seek real nutrition in pancakes, dainty aroma and flavor, palatable richness and easy digestion—*then* serve FIVE ROSES pancakes or griddle cakes.

Not only does FIVE ROSES flour bring the wonderful food value so plentifully stored up in Manitoba's finest wheat, but it makes

Delightful and Digestible Pancakes

Fried in pan or baked on griddle, no cake can ever disturb the most delicate stomach, *if made from a FIVE ROSES batter.* Simply because FIVE ROSES is such a sturdy and glutinous flour that it resists the absorption of fat, merely taking enough to brown becomingly with a golden contrast, to crisp with crinkly, curly edges.

Serve this *economical* dish oftener, since FIVE ROSES makes it so palatable and nutritious.

FIVE ROSES FLOUR FOR BREADS, CAKES PUDDINGS, PASTRIES

Serve a Variety of Pancakes

Ten tested recipes for pancakes and a full chapter on griddle cakes and waffles in *the famous FIVE ROSES Cook Book. Already over 500,000 ambitious housewives are learning to bake without waste through this 144-page manual. Let it help YOU to better bread, puddings, cakes and pastries. Send 30c for your copy. Address Dept. "K" Lake of the Woods Milling Co. Limited, Montreal and Winnipeg.*

word as well as a thoughtful deed for the dear ones of the home circle. How often it seems easier to do a kindness than to say a kind word. But above all we must try to wear a smile as much as possible. How often a pleasant smile means success to a young man or a young woman. Some say it costs nothing, but we know better. It is not an easy matter to smile when one is tired, sick, or disappointed. Nevertheless I believe it pays to screw our courage to the "smiling" point.

"You may as well keep smilin'
For there ain't no sense in rilin'
An' a longin' too intense;
For most things worth the gettin'
Are sure to find their place
When you're peaceful and a sittin'
With a smile upon your face."

Then again I think the New Year generally brings what the old year promised, though there is a surprise ahead of us all along life's way. As a rule most people find that the New Year chooses its way and events from the record of the year gone by. Life is really a progress, not a number of disconnected happenings. So we find both those that believe and those who scoff at New Year resolutions. Yet, a great majority it is safe to say, consider resolutions a help and while the happenings of the old are still warm in our thoughts, we are better able to decide upon the moulding of the next twelve months.

In view of these things we look forward to at least the achievement of part of our plans and some things over which we have no control will be accomplished. And in what we can't control, we are responsible only for the way we meet them. Resolutions start up on the New Year with at least a goal ahead of us and we may be put off the road many times after having started and sometimes, when we may think ourselves farthest from our goal we find ourselves standing, joyfully, just where we would be, led there unawares over the patiently trodden, unchosen, round-about road. It is not all all our choosink and our willing that fulfills our New Year resolutions.

In ending I would say with the poet,—

"Fresh courage gives the New Year
To all who drink his health
In waters of his bottling
That stand upon his shelf.
His wine of gladness glistens
And drives away all care,
So drink ye of the nectar
And health to our New Year."

The most successful farmers invariably are those who work hand in hand with the agencies which are trying to improve agriculture.

PRIZE WINNERS AT THE MARITIME WINTER FAIR

(Continued from page 199)

SPECIAL PRIZES OFFERED BY THE LIVE STOCK BRANCH, FEDERAL DEPT. OF AGRICULTURE — DRESSED POULTRY

Best six chickens, all of one breed—1, John R. Harrison; 2, G. F. Denton; 3, Wm. Retson; 4, C. J. Cock; 5, W. L. Lowe.

Flint.—1, Wallace Rhodeniser.

POTATOES

Best bushel from hand selected seed plot.—1, Fred Parsons; 2, Peter Brodie.

Round Red type.—1, Peter Brodie; 2, E. J. Vassie.

Long White type.—1, Peter Brodie; 2, E. J. Vessie.

Rose Type.—1, Peter Brodie; 2, E. J. Vessie.

Dark Skinned Type.—1, Harvey B. Parlee; 2, Peter Brodie; 3, E. J. Vessie.

The 1920 Short Course

AT THE

College of Agriculture, Truro, N. S.

WILL BE HELD

JAN. 6th to 16th, 1920

THE COURSE WILL BE DIVIDED INTO TWO DIVISIONS:

1.—The Big Four Days, Jan. 6-9. A course complete in itself brimful of valuable and interesting educational features.

2.—A Continuation Course, Jan. 10-16. Being a continuation of the Four Days Course, more detailed and complete.

THE FOLLOWING SUBJECTS WILL BE PRESENTED IN BOTH COURSES:—Judging Live Stock, Feeding Live Stock, Cultivation of the Soil, Seed Selection, Fertilizers and Their Uses, Dairying, Fruit Growing, Vegetable Gardening, Veterinary Science, Poultry, Gas Engines, Tractors, Farm Implements, Etc.

MOTION PICTURES WILL BE USED TO ILLUSTRATE VARIOUS FARM PRACTICES.

TUITION FREE TO STUDENTS FROM ALL THE MARITIME PROVINCES.

The Railways will grant 1 1/3 fare rate for the return trip on the Standard Certificate Plan from all points in the Maritime Provinces.

For full particulars write,
M. CUMMING,
Principal College of Agriculture,
Truro, N. S.

AWARDED BY THE STEEL BRIGGS CO., TORONTO

The member making the most creditable showing in not more than three varieties of selected seed will be awarded a special trophy in the form of a handsome silver cup, donated by the Steel Briggs Co., Toronto, Ont. This cup is not to be come the property of the grower until he has won it three times, not necessarily consecutively.

Wno by J. E. Murphy, 1919.

Silver cup, donated my S. J. Moore, Truro, N. S., for the best selected and best arranged exhibit of any variety of white oats.

Won by Jas. E. Murphy, 1919.

Special competition for boys and girls not less than 12 or more than 18 years of age, residents of the Maritime Provinces.

Wheat, any spring variety.—1, Norman Waugh; 2, Lloyd Waugh.

APARIAM PRODUCTS

Best dozen jars light—1, Julia Corbett; 2, Mrs. F. A. Jones; H. G. Miller.

Best dozen jars medium—1, H. G. Miller; 2, Julia Corbett.

Best dozen jars dark—1, Julia Corbett; 2, H. G. Miller.

Best dozen sections in comb, light—1, Mrs. T. A. Jones; 2, G. H. Weade; 3, P. J. Bett; 4, Julia Corbett.

Best dozen sections in comb, Medium—1, Julia Corbett.

Best three pounds of Bee's Wax—1, H. G. Miller; 2, Julia Corbett.

PEAS AND OATS FOR SILAGE

The results of six experiments at the Missouri Experiment Station in preserving field peas and oats in the silo show clearly that an excellent quality of silage may be secured from this crop. When the results are studied in connection with those from trials with other crops reported, there is no doubt as to the conditions necessary for making a good quality of silage.

Other than the usual precautions necessary for making silage of any crop, such as expelling the air by cutting the material into short lengths and by thorough tramping, it is necessary with peas and oats, as with legume crops also, to make sure that the water content is not too high. The best means of controlling this feature is to allow the crop to reach the proper stage of maturity, when the water content will naturally be such as to insure the proper preservation. The proper stage is when the oats are in the late dough stage or showing first signs of turning yellow. The pea pods should be showing indications of approaching maturity by a slight yellowness of the pods. At this stage the crop will contain between 30 and 40 per cent of dry matter, which is the condition necessary for making a good quality of silage.

If it is desirable to put the crop into the silo before it reaches the proper stage of maturity, good silage may be made by reducing the water content by allowing the cut crop to lie in the field for a few hours. A crop cut when the peas are in bloom and the oats in blossom will have only about 20 per cent of dry matter. This may be increased to between 30 and 40 per cent by exposure for five or six hours in the sun or until the plants appear wilted but not dry.—Missouri Bulletin 162.

GIRL WANTED

For general house work. Experienced girl preferred but will teach one who is willing to learn. Wages in keeping with capability

Bank of Montreal Issues Special Trade and Crop Reports

In Connection With the Annual Meeting Bank Receives Reviews From Superintendents Covering all Provinces. Reports will be Closely Studied in Business Circles Throughout the Dominion

Montreal, Dec. 23rd.—The annual meeting of the Bank of Montreal this year proved of very special interest, owing to the important matters dealt with in the addresses of Sir Vincent Meredith, Bart., President and Sir Frederick Williams-Taylor, General Manager.

During the past year, Canada, along with the rest of the world, has been passing through very exceptional conditions and it is generally recognized that there are very many problems ahead that will have to be carefully worked out. Many of these problems are not confined entirely to Canada, as they relate to the exchange situation between this country and the United States. There is also the difficult undertaking of equitable taxation that must be worked out in Canada, and Sir Vincent Meredith made a suggestion in this connection which is sure to receive very careful consideration.

Sir Frederick Williams-Taylor made an interesting statement in connection with the policy followed by bankers during the war period, showing that there had been absolutely no profiteering whatever by the Banks of Canada, for the price of money had not been raised, and that alone of all commodities, the cost to the borrower of loanable funds of the banking institutions of this country remains unchanged. Sir Frederick also dealt particularly with the position of the Bank of Montreal and stated that it had never been in a healthier state than at present, and on this account was well prepared to meet any conditions and contingencies that might arise.

At the Annual Meeting of the Bank of Montreal, complete reports were submitted by the Superintendents of the Bank, dealing with trade and farming conditions in the various provinces of the Dominion. These reports cover the particular operations carried out in the various sections of the country, and on this account become of very special interest to the mercantile and farming communities desirous of keeping in touch with the important developments that are occurring throughout Canada.

We quote from the different reports as follows:—

Quebec.

The cut of lumber during the past season was not as large as usual. Practically all stocks have been sold and shipped out. Prices were high. Labour conditions show improvement and a larger cut is looked for this winter.

The demand for pulpwood from the United States was uneven, but stocks have been well disposed of and high prices are expected to be maintained.

The paper mills of the Province continue working to capacity, the demand for newsprint and better qualities of print papers exceeding the supply.

Manufacturing in nearly all lines has been generally satisfactory, although production is still limited by scarcity of skilled labour and raw materials.

Hay and cereal crops were average. Root crops were large, but potatoes suffered from rot. Pasturage was good, and dairy products will show an increase.

With the exception of asbestos, there is little mining done in the Province. Asbestos prices are good and shipments are well maintained.

The fur business has been good, and boot and shoe manufacturers find difficulty in supplying the demand.

Shipbuilding continues active, a number of large steel vessels having been launched from different yards during the year.

The wholesale and retail trade was most satisfactory; collections were good and failures show a decrease.

There have been no exceptional expenditures during the year by the Dominion or Provincial Govrnments and municipalities have limited disbursements to necessary works. Practically no railroad construction was undertaken.

There is very little speculation in real estate; values and rentals are both high.

General conditions, both in cities and rural districts, are good, with no apparent slackening in trade since the termination of the war. The housing problem is everywhere acute, and those dependent on a fixed nicome are seriously affected by the abnormal cost of all necessaries.

Ontario

Manufacturing in Ontario has been limited only by shortage of supplies and disturbances in labor. Government credits for goods sold to Europe have stimulated manufacturing, and domestic demands have been insistent. New industries have been started, and a number of successful manufacturing concerns in the United States have been making enquiries with the intention of locating in Ontario.

Ontaro farmers have been steadily bettering their position in recent years, installing modern equipment and improving their modes of living. The past year has been one of fair crops and high prices. A wet spring was followed by an exceptionally dry summer, and grain crops, with the exception of fall wheat, fell below the average. Root crops were good; corn and tomatoes were a record yield; the season was poor for all fruit except grapes. Cheese production showed a falling off. There is a shortage of hogs; sheep raising is on the increase. The cattle situation is somewhat unsettled, owing to the limited amount of feed available for carrying through the winter.

The production of lumber has been seriously reduced owing to shortage of labour. 1919 has been an excellent marketing year, with heavy sales to Great Britain and the United States, and a steady domestic demand for all classes of lumber. Prices have been unusually high, there is no accumulation of stocks on hand, and notwithstanding the scarcity of labour and increased costs of operating, the year has been a successful one. Pulp and paper have been in large and increasing demand, with soaring prices for the latter.

Mining production during the year has been curtailed. The demand for nickel fell off after the Armistice; strikes lessened the silver output. Both these situations are improving and larger production has taken place at the gold mines.

Both wholesalers and retailers report it easy to sell goods. Credits are shortened and bad debts negligible.

Larger expenditures ere generally made by municipalities this year in an effort to overtake works postponed during the war.

Population shows a general increase, with a tendency to drift to urban and manufacturing centres.

Values in real estate are steadily increasing. So little building took place during the war that there is now a general shortage, particularly in dwelling houses, and in consequence there is much activity in real estate and an improvement in the building trades.

There has been a continued extension in hydro-electric power during the past year, and works at Nipigon and Chippewa, as well as at other places less important, will, within the next two years add very largely to the available power for manufacturing and other purposes throughout Ontario.

Generally-speaking, the year has been one of great activity throughout the Province.

Maritime Provinces

The past fishing season has been successful, the catch being almost a record one. Prices are lower, however, and ocean transportation is still restricted. The American, West Indian and Southern Brazil markets will probably take most of the available supply.

The output of coal was below last year's figures, owing to a slackened demand, a shorter working day and labor unrest. Steel plants show a decreased output. The construction of the new plate mill at Sydney nears completion, and when in operation will be a factor of great importance commercially to the whole Dominion.

The lumber cut was above that of last year and has been largely sold to the British and French Governments at high prices. The demand is good from the United States, but sales have been curtailed owing to transportation difficulties. Labor is more plentiful and, notwithstanding high wages and the excessive cost of provisions, indications point to an average cut this coming winter.

The crop of hay and cereals was above the average. Root crops were again large, but potatoes were slightly damaged by rot. Fruit harvested in good condition was almost a record crop.

Manufacturing along conservative lines show steady progress.

Owing to continued excellent prices received for farm products, fish and lumber, and the high wage scale, both wholesale and retail trades have been good, with few and unimportant failures.

The Dominion Government expenditures have been largely confined to work on ocean terminals at Halifax and to the dry dock and breakwater at Courtenay Bay, St. John.

Provincial and municipal expenditures have been limited to necessary works.

A steel shipbuilding plant is being built at aHlifax, and four steamers are already in course of construction. Small wooden vessels continue to be built in Nova Scotia and New Brunswick, although the demand is not so good as a year ago.

Business in the Maritime Provinces has been little affected by the change from war conditions to those of peace and trade activity continues.

SIXTH ANNUAL CONVENTION OF WOMEN'S INSTITUTES OF P. E. ISLAND

The Sixth Annual Convention of the Women's Institutes of P. E. I. was held in the Household Science Rooms of the Department of Agriculture, Charlottetown, Nov. 6th and 7th. There was a good attendance considering the very unfavorable weather. The Session opened with Miss Della Saunders, Supervisor of Women's Institutes for P. E. I. in the chair. After the singing of "O Canada" Hon. Walter M. Lea, Commission of Agriculture, welcomed the delegates to the city. He heartily congratulated the members of the Institutes for the splendid work accomplished by them during the war and said that if they had done nothing more thana this, their organizaztion had been well worth while. He then spoke of the marked improvements in the schools in all districts where the Institutes were operating . In closing Mr. Lea strongly urged the women to continue the good work for which the Women's Institutes were formed, to do all in their power to encourage education, to meet as often as possible and to make the most of the great opportunities which are before them.

The following reply to the Address of Welcome was given by Mrs. J. Lockhart, of New London.

The Hon. the Commissioner of Agriculture, Madam Chairman and Ladiees:

It is my privilege on behalf of the Women's Institutes of Prince Edward Island to reply to the address of welcome delivered by Hon. Walter M. Lea, and we thank him sincerely for his eloquent words of welcome and encouragement. We fear that owing to the lateness of the season at which the convention is beng held, that the attendance may not be as large as on former occasions, but we who are present mean to enjoy to the utmost the varied program provided for us, and hope to carry to our homes fresh inspiration, deeper enthusiasm and a fuller comprehension of the aims and ideals of which we are banded together.

Our last meeting in July 1918 was overshadowed by the awful war raging with an intensity unparalleled hitherto but now what a change. In a few days we celebrate the signing of the armistice when the thunder of the guns ceased, and although there is yet much fighting and bloodshed in war torn Europe and much unrest and turmoil in the home land, we pray God our beloved land may never again sound with the tramp of armed men, going forth to slay their fellow men. We rejoice that so many of our soldier lads have been spared to return to us, and for those who mourn young lives, who gave the fresh red wine of youth, that some small corner of a foreign land might be forever Canada," we can only commend them to Him who saith, "Greater love hath no man than this that a man lay down his life for his friends." Never before has such sorrow and sacrifice been borne and from the depths to which we have gone, may we rise in newness of life and go forward to nobler, better things. May we have a clearer conception of our duty and what the term Brotherhood stands for and a realization of the big things we can accomplish in unity of spirit.

During the four years when the war was raging, the women of our Institutes were wholly engrossed in war activities and Red Cross work and now that the war is over is there no further need for the Women's Institutes and kindred organizations? Apart from the money raised for patriotic purposes and knitting and other work accomplished for our soldier lads the Institutes have been a great help to our women, especially in isolated country districts. Our horizon has been broadened; women hitherto wholly engrossed in house work have begun to take an interest in something outside the home and in meeting together, motives and aims are better understood and each draws from the other support, encouragement and confidence, and although home interests will ever have first place in every true woman's heart, there are many interests touching the home that demand her attention. The school question is one of these, If the homes of the nation are her strongest forts, the schools of our country may be compared to training camps where young soldiers are trained for the battle of life, but one has only to drive through the country and note the dingy, neglected looking school buildings, in their unattractive surroundings, to realize how far short they are of what they should be, and see that there is work here that our women must take hold of. The school problem is the burning question in our province lately ,and we are gald to note that the government has granted the increase in salary asked for by the teachers' union but even with this increase, salary is still inadequate as the supplement in some districts is pitifully small, and we would urge on all Institute members to attend the annual meetings, and as women now have a vote in school matters, to see that a substantial increase is voted for teachers' supplements as well as for necessary improvements about the school.

We are glad to note that so many school fairs have been held during the year, and we hope that next year every district will be represented, thus deepening the interest of the parents as well as the children in the school, stimulating a healthy rivalry between the different districts and encouraging the pupils to take an interest in live stock and other forms of agriculture, so necessary in our province. Then we want compulsory education; medical inspection of schools, etc., but as these subjects may be discussed at this convention, we must close, thanking you again for the kind words you have spoken, and expressing the hope that confidence you have expressed ii us may not be misplaced.

Miss Saunders, Supervisor, then gave her report of the year's work. The following statistical statement was submitted:

Total receipts	$6,061.75
Spent for patriotic purposes	3,063.73
Spent for school improvements	343.68
Miscellaneous	1,046.76
Socks knit	2310 pairs
Mitts knit	250 pairs
Xmas boxes packed	225
Quilts made	15
Prioners of war supported	25
No. of Institutes organized	33
Total membership	750

Reports were then called for. These proved very interesting showing that the Societies have taken up many forms of community improvements since the need for Red Cross work is past. Pumps in the schools, new desks, hardwood floors, school room and outbuildings kept in a sanitary condition, school house painted, both inside and out, are some of the improvements noted. A number of the Societies have built and furnished a room in which to hold their meetings, while others have made improvements in the town hall, a few have even bought a piano for the public hall.

An interval of music followed and a paper was read by Mrs. Wm. Pendergast, of Hope River, on "Our Rural Schools and Communities."

At the close of the afternoon session the delegates were conveyed by autos to th Y. W. C. A., where they were the guests of the Board of Directors to Afternoon Tea and where a delightful social hour was spent.

The feature of the evening session was a splendid address by Capt. (Rev.) eGorge Taylor, on "Woman's Work in War and Peace," in which he paid a splendid tribute to the women of the Empire during the recent war. A song service of "Old Time Favorites" concluded the evening's programme.

At the Friday morning session, Mrs. J. H. MacDonald, of Souris West, presided. Miss Bona Mills, Secretary of the Y. W. C. A., Charlottetown, delivered an address on "Literature for Young People."

Mr. J. A. McFarlane of Napanee, Ont., had chilblains so bad that he couldn't wear boots. Egyptian Liniment relieved them. Don't suffer from chilblains this winter. This liniment is also for Frost Bites, Burns Scalds, Cuts, Bruises, Sore Chest and Throat, Neuralgia, etc.

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid, and put you in touch with women in Canada who will gladly tell what my method has done for them.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me today for free trial treatment.

A MESSAGE TO WOMEN!!

Mrs. M. Summers, Box 309 Windsor, Ont.

Miss Mills said that the awakening of the girl in her teens to new phases of mental activity reveals itself in her passion for reading. The books which she has read have a tremendous influence on her mental life. Who helps the girls to satisfy their hunger for good reading? asked Miss Mills. With the exception of the old standards, comparatively few books are wholesome, fascinating, interesting and free from those problems, of which few women and no girls can dwell on with profit. Modern writers have given us few fine standard books. These, the older women should seek out and read and pass them on to the girls,, thus very definitely doing their part to protect and develop character. The books the girls read should be carefully chosen and adapted to real life. From fifteen to seventeen the girl's character is gradually being shaped. From this period emerges permanent personality. At this time the girl is responsive to any stimulus from the outside world. It is the period of greatest development of imagination. Girls in their teens are at the hero worshipping stage. Hence the literature she reads should be such as to give her a concrete ideal of womanhood. The world is full of noble, heroic, womanly women, and the girls need to know about them. It is very necessary that the girl should be able to choose both what is worth reading and what is not. To promote an interest in good reading, literary evenings might be arranged on such topics as "Making Books Your Friends," with favorite selecitons from books read and discussed. Miss Mills then dwelt on the place of poetry in the girl's life; the making of friends with famous women and other phases of her subject.

"Music as a Factor in the Home and Community" was the subject of an interesting paper read by Professor Watkis, Organist of St. James Presbyterian Church, Charlottetown.

In dealing with the outstanding characteristics of music, Professor Watkis pointed out that it is among other things educative. It is both an art and a science, although the greater majority of people do not think of music as being a science. After dwelling on the uplifting power of music an an aid to Divine worship, Professor Watkis spoke on its power to bring us into closer touch with God's creation. All nature is in harmony. It is full of melody and alive with divine rhythm.

Mr. Watkis then dwelt on music in the home, strongly denouncing the trashy music which is too often found there, and for which there is no excuse when good music can be so readily procured.

He then spoke of the need of musical instruction in the schools as part of the curriclum. To this end teachers should first be instructed in music at Prince of Wales College.

Mr. Campbell, Superintendent of Education, then spoke on "Better Rural Schools for P. E. I." Mr. Campbell said that the Educational problem in this Province, as well as in other provinces of Canada, is the problem of the Rural Schools. In cities, towns and villages where children are near the school where they are not required to work at home, and where graded schools are possible, conditions are more favorable for efficiently carrying on the work, than in the country. Out of 486 schools in P. E. I., 406 are one-room schools. These are in the rural districts. The teachers have many handicaps to contend with, such as unsanitary buildings, meagre equipment, irergularity of attendance, indifference of parents, etc. The securing of better schools is to some extent a question of money, but it is not wholly so.

Mr. Campbell pointed out that the parents can help by co- operating with the t eachers. They can assist in maintaining discipline by refraining from criticizing the teacher in the presence of the children. He also advocated emdical and dental inspection of the school children.

The Superintendent said he had a vision of what a Rural School should be. It should have at least two departments in charge of good teachers. There should be a good airy, well lighted basement which should be used by the pupils for a playroom in rainy weather. The building should contain a large, well furnished, Community Hall, also cloak rooms, a room fitted with a bench and a few tools for aMnual Training, a kitchenette for preparing hot lunches and teaching rudiments of Household Science. There should be a comfortable cottage for the teacher and a garden in which vegetables should be raised and the pupils receive instruction in Nature Study. Such a school would meet the needs of elementary education and should not be beyond our reach.

Our fathers and grandfathers, in the face of difficult conditions, organized school districts and built schools. We have been content to go on in the old way with little improvement over the old condition. In educational matters we have undoubtedly been a little slow but, "When a woman wills, she will" and if our women take up this subject for better schools and insist upon having them, Mr. Campbell was confident that in good time we would have tnem. Womens' Institutes are going to exercise a greater power than ever bfore in our schools, said Mr. Campbell. In closing he urged the womn to take advantage of the opportunities which are theirs and to make their Societies "Powers for Good" in their communities.

The closing session of the convention was held Friday afternoon. Miss McKenna, Assistant Supervisor, presided. The question box was first opene dand various questions asked brought forth interesting discussions.

The business of the convention was then dealt with. The program for the year and the work to be taken up by the Societies were discussd. Community Improvement and the Betterment of School Conditions were subjects much favored by the members.

Miss Saunders followed with a demonstration on "The School Lunch Box." She explained points as to the proper kinds of food for the school lunch, how to pack same and the best type of containers to use. The subject of "Hot Lunches" was also discussed and Miss Saunders expressed the hope that this work would be taken up by the Institutes.

The afternoon session was brought to a close by the serving of "Ideal School Lunches" to the delegates. This proved a very enjoyable part of the program and brought for many favorable comments.

The proceedings closed with the singing of the National Anthem.

In the evening the delegates were entertained at the Prince Edward Island Theatre.

The Biting Cold of Early Morn

won't get through your *Eureka Underwear.* When you get up to do chores before breakfast, you won't mind the chill of the bedroom, or the bitter northeaster blowing between barn and house, with *Eureka Underwear* next the skin.

A VALUABLE SUGGESTION

Ellershouse, Dec. 19, 1919.
Maritime Farmer,
Sussex, N. B.

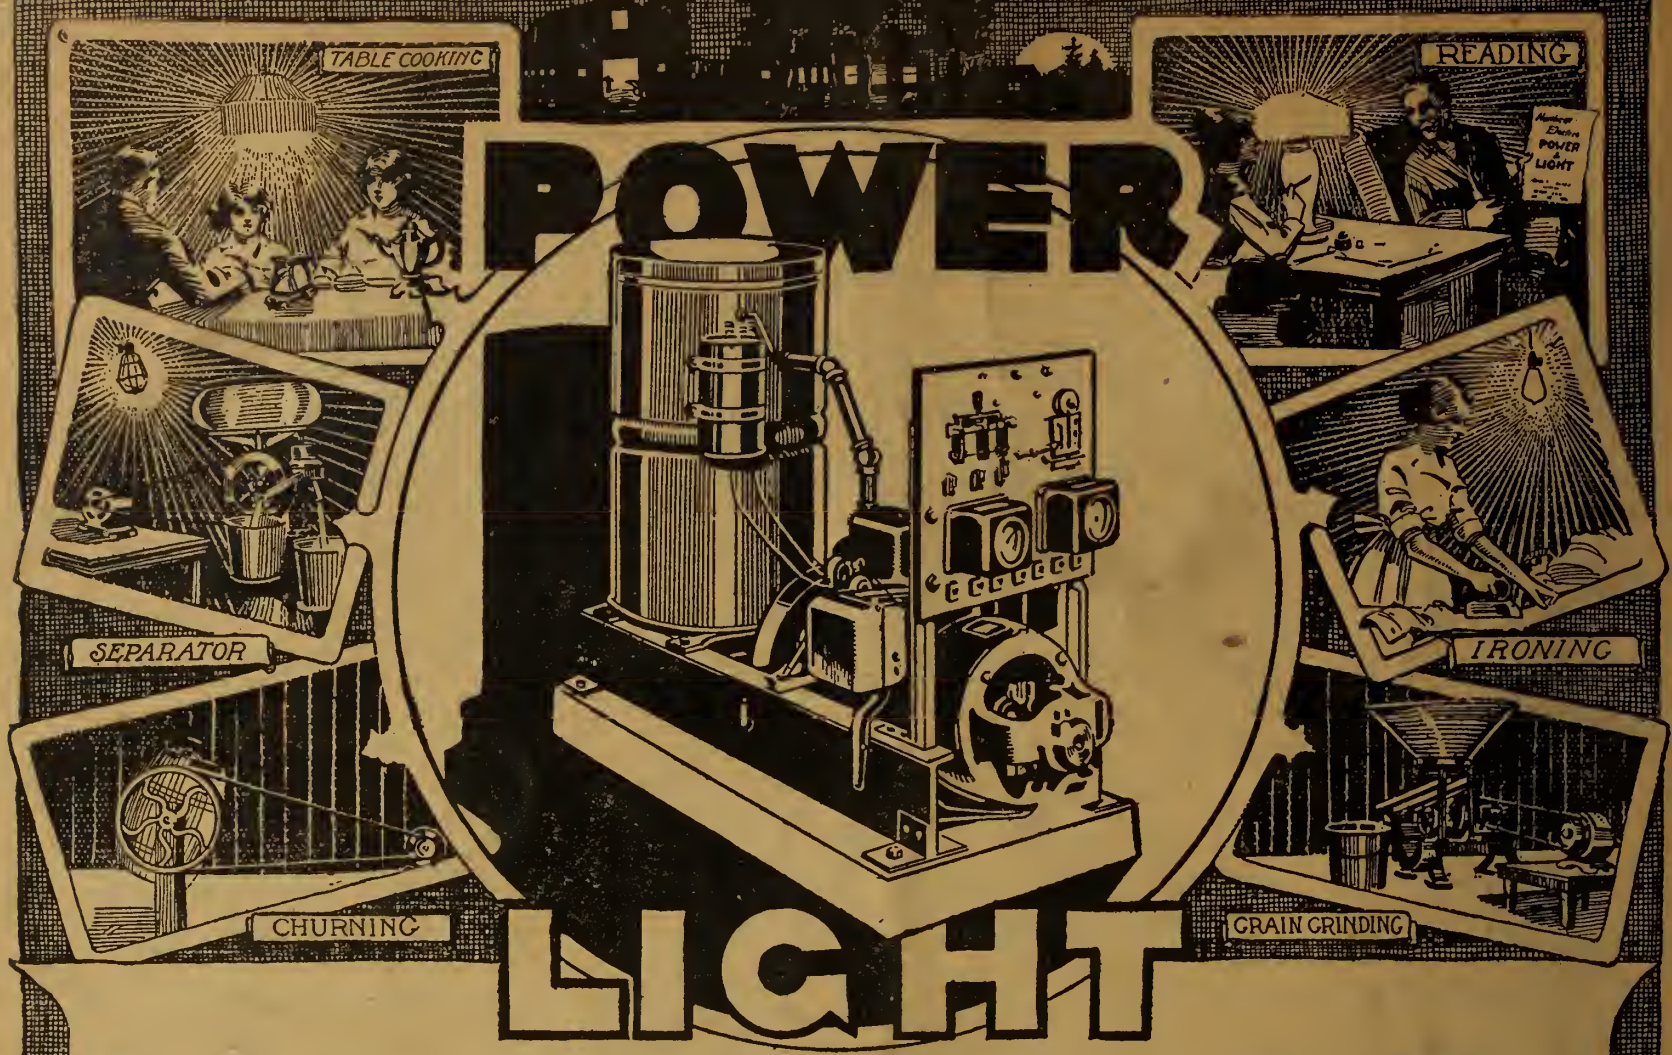
My Dear Sir:—One of the great losses of the country is the pure bred bull calves that go to the butcher for want of a sale; and the Society bulls also, to prevent in-breeding. What is needed, I think, is first, an "exchange" ad column in a farm paper, and second, that that paper should reach the officials of every agricultural society. I used to have some connection with the publicity business, and think that if you could get some sort of a bonus from the Nova Scotia Farmers Association, and some similar association in New Brunswick, and Prince Edward Island, you could send the Maritime Farmer to the Secretary or President of every Agricultural Society in Nova Scotia, New Brunswick and Prince Edward Island, at usual postage rates. Resultantly, it would make your advertising worth a great deal more because each of these societies are a potential buyer of registered stock.

Then, feature an "exchange" ad column, in which say the Lakeview Agricultural Society offers a registered Jersey bull, age, etc., stated in exchange for another bull of similar breed.

Second, you use your influence to get say the Provincial Farmers Associations to advertize for pure bred registered bull calves at 25% bonus above butcher's prices, plus cost of raising, and at the same time the Society offers to exchange through some local agent of theirs to supply to any farmer such a registered calf in exchange for a scrub bull calf, on a 25% bonus basis. That is, my $10.00 scrub calf is taken by the agent (and of course, sent at once to the butcher) and I pay a difference of $2.50 to him for a similar weight of registered bull calf.

Second—to any farmer that will undertake to keep her for six years, and breed to a registered same breed bull, and who has no pure bred registered cows or calves in his herd, a heifer calf in exchange; but perhaps at a bigger bonus. This to my mind is a much better way to get pure stock in the country than full grown bulls. With the Maritime Farmer going into every Society, and the Governments co-operating to provide pure stock, even if it has to breed some there could be made a mighty change in a few years.

Sincerely yours,
H. PERCY BLANCHARD.



As Sure as the Sun Sets in the West so Sure will you Need Electricity on the Farm

APART from altering international boundary lines, the war has shown farmers how to concentrate; how to devote their time and energy to big and important things. But what about the little jobs? Somebody has to do them; to turn the cream separator, churn, grindstone, grain grinder, saw wood, pump water, etc. These are the chores that the

Northern Electric POWER and LIGHT

will do for you. Jobs that take muscle and time from the big end of farm work. Then, too, there is the domestic side of farming. Electricity in the home means wholesome freedom from many daily drudgeries. It will run the washing machine, iron, vacuum cleaner, sewing machine, operate the toaster and many other electric household utensils. It will flood your house and outbuildings with a safe, bright, clean and economical light. No oil lamps or lanterns to bother with.

Think what a help and convenience Electric Power and Light will be to you on the farm if you make it the Northern Electric way.

The system is entirely automatic; not even a button to press. No complicated parts or unnecessary frills to get out of order. Built for real hard work and long service with economy of upkeep. As simple and easy to look after as the Northern Electric Telephone you know so well.

NORTHERN ELECTRIC POWER and LIGHT is guaranteed absolutely reliable. Plenty of power; plenty of light. Progressive farmers all over Canada are buying the Northern Electric system because of its honest dollar-for-dollar value.

There is a Northern Electric system for every requirement. All types, all sizes, either direct connected or belt driven, operating from 15 to 1000 lights or their equivalent in power for farm work.

May we send you some interesting illustrated leaflets? You are not obligated in any way. Fill in and return coupon today

Sussex, N. B.

CARBONATE OF LIME IN APPLE SYRUP; KEEPING CIDER

Why is powdered calcium carbonate or carbonate of lime used in making apple syrup? What is your idea of keeping apple cider? Is benzoate of soda or salicylic acid, one ounce to the barrel, 4 to 0 gal., advisable?5—W.M.

Carbonate of lime is added to the apple juice and the precipitate removed to reduce the acidity. It is a harmless addition, for, even if you get in too much, it is so insoluble that it is all filtered or strained out later, and you have a better syrup as a result.

Opinions differ as to the use of the preservatives you mention. We do not think they should be used if the cider is to be offered for sale, unless the fact is clearly stated to the buyer and even then there may be some local health regulation against it. But we are unable to share the prejudice against the preservatives when used in small amounts in cider or similar fruit juices for domestic use. The quantities which you quote are quite small, in fact rather too small to be much good unless the cider is very fresh indeed, and even if you doubled them you would not get as much of either acid in an ordinary drink of cider as you would if you ate a dish of cranberry sauce or chewed a few wintergreen leaves. It would be quite another matter if cider so preserved made up a large and regular portion of your daily diet. After all, the one sure preservative is heat, but the flavor of apple juice is so delicate that it is some what the worse for sterilization.

LIME AS A SOIL IMPROVER

Failure to produce good crops may result from a lack of the essential elements of plant food—nitrogen, phosphoric acid, potash, or because of unfavorable weather conditions disease or insects; but even with good culture, and with all requirements for a successful crop apparently met, the crop may be an economic failure because of the lack of limestone in the soil. More failures probably can be attributed to this lack than to any other single soil condition.

It is a well recognized fact that the basis of successful crop production centers around the clover plant. Failure to produce a good stand of clover may mean ultimate failure in farming operations. It is to insure a perfect stand of clover that lime is so important on very many farms.

Limestone wil not take the place of the essential elements furnished in stable manures and commercial fertilizers and it should be used in addition to these. Limestone corrects soil acidity so objectionable to the clover, furnishes a base essential for the development of food combinations suitable for the clover plant, supplies needed lime to the plants, and improevs the physical condition of the soil. That such is the case is amply demonstrated by many tests conducted at the Experimental Station, Kentville, where clover cannot be successfully grown without limestone, and where clover hay yields have been increased nearly 100 per cent. by an application of 2 tons per acre, all other conditions being similar, and subsequent crop yields increased nearly 25 per cent. because of this increased clover growth.

The clover plant benefits the soil for all future crops not only through improved mechanical soil condition resulting form the network of deep feeding roots decaying, but by furnishing nitrogen which has been extracted from the air in the soil by the nitrogen-fixing bacteria living on the roots of the clover plant which will flourish only on acid-free soils; not only will heavy soils be lightened and he made more drought-resistant, but light soils will be made more compact and rendered more retentive of moisture. Further, better aeration and more suitable soil condition for soil bacteria are brought about.

To illustrate the improvement, we may instance one series of plots where ground limestone was applied in 1914 aid 1917 at the rate of 2 tons per acre in the spring of these years and worked into the soil. Fertilizer was applied in 1914 and 1917 in equal amounts to each plot and, in the fall of 1916, 15 tons of good stable manure was applied evenly over both limed and unlimed areas. The area was rotated with potatoes, grain, clover. The soil was a sandy loam in a low state of fertility. The yield per acre was as follows:—

1914, potatoes, 76 bushels, 13 lbs.
1915, oats, 31 bushels, 24 lbs.
1916, hay, 666 lbs.
1917, potatoes, 302 bushels, 25 lbs.
1918, whteat, 23 bushels, 48 lbs.
1919, hay (largely timothy, first crop) 3,136 lbs.

The yield from the limed fertilized area was:

1914, potatoes, 86 bushels, 45 lbs..
1915, oats, 38 busels, 14 pounds.
1916, hay, 1,494, lbs.
1917, potatoes, 329 busels, 18 lbs.
1918, wheat, 30 bushels, 14 lbs.
1919, hay, (largely clover, first crop) 4,926 lbs.

There is a heavy stand of second growth clover on the limed area and a very light growth on the unlimed plots. The increase from liming was 38 bushels, 25 pounds potatoes, 7 bushels, 24 pounds oats, 6 bushels, 26 pounds wheat, and 2,618 pounds clover hay per acre.

From present indications more marked results will be obtained in future crops, as the physical condition of the soil has markedly improved.—W. S. Blair, Supt., Experimental Station, Kentville, N. S.

OUR APPLE FUTURE

The apple is king in the Annapolis Valley, and we are now gathering the fag end of the biggest crop we have ever had.

Our orchards have been taxed to the very limit, and our orchardists, will have to put back into their orchards vitality to replace what was used this season, or else the slump in the crop of 1920 will be enormous.

Orchards will have to be liberally fertilized, so as to ensure a vigorous an dhealthy growth, and nature will have to be assisted in the polination of the coming blossom.

The fact has been established that the Bee is our most efficient ally in that respect, and it is up to us to make uuse of all the Bees that can be secured, so that their work in our orchards may result in more fertility and consequently more thoroughly developed apples.

It has been established beyond question, that when the apple blossom is not sufficiently pollinized, the result is a poor dwarfed apple, that does not develop or mature; that is simply a useless incumbrance to the tree that bears, it, and that eventually lets it go in what is usually termed the June drop.

The Dominion Atlantic Railway is working hard to interest our growers in the value of the Bee, is showing films illustrating the matter, and showing them free all over our Valley, in fact in every community no matter how remote from the Railway, asking only that the people shall apply for them. They are also willing to assist the farmer to procure Bees so that it is all up to them, as to whether the present production increased from year to year, or whether we go back and accept just what nature gives us, while we fold our hands and look on.—Advertiser.

BORAX WITH POTASH INJURES CROPS

Many complaints regarding injury to crops apparently resulting from the use of potash from Searles Lake, Cal., recently have been received by the U. S. Department of Agriculture. The natural brine of this lake from which the potash salts are prepared contains a considerable amount of borax. Apparently one, at least, of the companies operating in the locality did not exercise sufficient care in the preparation of the potash and let out a considerable amount of potash salts in 1918 with a high percentage of borax, averaging probably 10 per cent. and in some samples going as high as 23 per cent. The department has been conducting investigations of the matter in the field whicr indicates the substantial corectness of many, at least, of the complaints. In some of the special fertilizer tests of the department where Searles Lake potash was used, injury, which apparntly was the direct result of the high percentage of borax, was clearly shown, while potash form some other sources showed beneficial effects upon the crops tested.

MAKE PLANS TO STORE AWAY SUPPLY OF ICE THIS WINTER

An ample supply of ice is of greater economic importance in the country home than in the city residence. Folks in the city can buy perishable supplies as needed, but the remoteness of many country homes from markets often makes it necessary to use canned, corned or smoked meats use canned, corned or smoked meat producs all through the seasons of the year when the table should be supplied with fresh meats.

In the country, ice is appreciated not only for its use in the preservation of fresh meats, butter and other table supplies, but it is well nigh invaluable in the production of high grade products.

Ice is a luxury which everywhere can be had almost for the gathering. The cost of harvesting and storing is not to be compared with the comfort that it brings. The cost of packed ice of course, varies in different localities, but on the average the total cost of harvesting, hauling, storing and packing is about $1 a ton.

With the natural advantages of abundant streams, lakes and ponds of clear, pure water and the cold winters there is little excuse for most farm homes not being equipped with facilitise for storing sufficient ice to last through every summer. The harvesting is done at a time of year when the men and teams are not too busy, and after the construction of a suitable ice house, the cost is insignificant.

Source of Supply

The stream or pond from which the ice is taken should be fed from a source free from contamination or pollution. If the stream is so sluggish that water weeds thrive in it, all vegetation must be removed to prevent its freezing in the ice. Decaying vegetation forzen in ice is objectionable because as the ice melts, the refuse is deposited in the ice box or refrigerator, making it dirty and dangerous to health. Ponds in which green spawn grows profusely can be rid of these pests by copper sulphate. The crystals can be placed in a cloth sack, hung to a pole and drained through the water until the salts are dissolved. One or two treatments at the rate of one pound to one hundred thousand gallons of water will keep down such growth and make the water clear and pure.

Cubic Formation Best

To keep well, ice must have a minimum surface exposed to air or to the packing material; it must have thorough insulation to protect it from heat and air; it must have good drainage and it must be packed to prevent as nearly as possible the circulation of air through the mass.

The more nearly the mass of ice approaches the solid cube, both in shape and texture, the easier with good drainage and insulation, will be the keeping problem. Experience has shown that the cube formation is the best. A mass of ice twelve by twelve by twelve exposes less surface than the same tonnage piled in any other form.

Farmers who have only a small quantity of ice to harvest will need only two saws, two ice tongs, two ice hooks and a pointed bar. In co-operating with neighbors to fill community houses, these tools may belong to individuals or the complete outfit might be bought by the community organization. The advisability of cutting square or oblong cakes must be decided by the harvester. Oblong cakes twenty-two by thirty-two inches have the advantage that they can be lapped so as to break joints as they are stored and thus reduce the possibility of air passages in the ice heap.

The function of an ice house is to prevent outside heat from passing into the interior and melting the ice; such passage by interposing in the walls a material which will resist its transfer from the outer to the inner side of the building. The best insulators appear to be those containing the greatest amount of entrapped air confined in the smallest possible spaces. No entrance should be allowed near the ground line as the cold currents of air at the bottom will filter through.

Insulation is Needed

If the foundation and walls are air tight at the bottom, an opening at the top has little effect as, when the warm air enters it will remain at the top of the room. A layer of insulating material should be placed on the floor and the ice stacked on it. There shoul also be a layer between the ice and the walls. Ice should never be stored directly on the ground which is a conductor of heat, especially when wet, as all ice house floors are sure to be. Planing mill shavings are better than sawdust for insulating. They are elastic, they do not settle rapidly and do not absorb moisture and most important, are free from dirt. There are several makes of commercial insulator which are better than either sawdust or shavings and cheaper in the end, but their initial cost is somewhat greater.

Thorough drainage is esstnial. If the floor is below the level of the ground, sufficent drainage usually can be obtained through the soil, especially if the soil is porous. With a clay soil, it may be necessary to excavate a foot or two and fill in with cinders or gravel and to place a three inch porous tile under the floor. This drain should be properly trapped or sealed to prevent warm air from enteing the floor. All floors should slope towards the centre of the floor to prevent the ice from falling against the walls of the building and in houses having water-tight floors, to carry the water to the drain.

There is bound to be some melting of ice, causing moisture to settle on the walls and ceiling. If the building is of wood, it absorbs the moisture and rot and decay follow, so wooden houses should have a ventilating system that can ve controlled. The ceiling should be sloped to the centre in order to carry the warm moisture laden air to the ventilator. In houses with some form of commercial insulation that will take a cement finish on the interior no ventilation is necessary. The building should be constructed so that there will be a circulation of air through the outer walls and at the eaves to the ventilator on the roof as these air currents tend to break up heat radiation through the walls and roof.

Quantity of Ice Needed

Owing to the different conditions under which ice is handled, the locations of the buildings and the quantity packed, there is a wide variation in shrinkage. Generally speaking it will take a ton and half of ice to cool the milk from each cow. From forty to fifty cubic feet of space are needed for a ton of packed ice. About 50 per cent. more ice should be packed than actually is needed. This amount will allow for a heavy shrinkage and for generous household use.

Canadian Guernsey Breeders in Annual Convention

The annual meeting of The Canadian Guernsey Breeeders' Association was held in the Winter Fair Building, Amherst, N. S., on Wednesday, December 17th, at 2.30 p. m. T. D. Bates, Brookfield, N. S. president of the Association, occupied the chair and H.W. Corning, the energetic secretary of the Club was also on hand to boost the breed of which he is one of the foremost breeders in Canada. The Guernsey Breeders' Association is Domnion wide in character and the Maritime enuthsiasts were pleased to welcome to the convention their Honorary President, Hon. Sidney Fisher, of Quebec, who has been for many years an ardent admirer and breeder of good Guernseys. Mr. Eric Fisher, a nephew of the Honorary President, who is also a breeder of Guernseys, was warmly welcomed by the Maritime boys.

The minutes of the last annual meeting and financial statement were read and approved. The financial statement showed a credit balance of $491.75.

Dr. M. Cumming, who was the first speaker, told of the proposed establishment at Nappan Experimental Station of a herd of Guernseys and referred to the increasing popularity of the breed The demand for Guernseys as family cows was ever on the increase and as a consequence there should be many more breeders of Guernseys in Nova Scotia than there are at present. He was glad to note an increase in the inter-provincial trade in Guernseys. This should be encouraged, for the breders who wll make some good sales will surely progress and introduce new blood into their herds.

Capt. Hugh Dickson, who took up the discussion was pleased to know that a herd was to be established at Nappan, but he thought the Associa tion would be well advised to keep on calmoring for the establishing of a herd on the College Farm, Truro, where the merits of the breed could best be advertisd.

Hon. Sidney Fisher, the next speaker, said he was just as enthusiastic a breeder as when he first started with Guernseys. He had tried other breeds, one herd of which he had contrasted for ten years with his Guernseys with the result that the Guernsey herd had remained in sole possission of his dairy stables. He had been unfortunate in getting one or two imported animals that were the means of polluting his entire herd which had to be destroyed, thus causing inconvenience and loss. Not discouraged, however, he cleaned his stables, purchased disease free individuals and is again building up a herd with a clean bill of health.

His observation, after visiting many herds on the American side of the line is that the breeders to the south of Canada are going in for a bigger and stronger type. The pale fawn color is more fashionable than the darker shades. Canadian breeders should pay more attention to conformation and business capacity as indicated by the scale of points, generally recognized desirable in a good cow.

Production, he said, is dependent, to a great extent, on abundance of well balanced rations and good care. The ill nurtured cow can not be a vigorous cow nor can she produce profitably. Farmers must learn to feed judiciously of the best feeds available. The breeder who can grow turnips should feed them liberally as the cow that receives a fair share of roots can handle the heavier feeds most profitably.

There is a big boom on in the Guernsey circles of the United States and Canadian breeders should pattern after the sucessful breders over there by paying more attention to advertising, a feature that is of as much importance to the breeding business, as it is to the devottes and handlers of any other commodity.

Breeders should keep their advertisements continuously in the farmer journals and should aim to answer all correspondence promptly.

Many of the larger herds across the border are in the hands of wealthy owners, who look upon them as play things and who know little about them. This is not in the best interests of the breed and consequently prices range too high. The smaller breeders are the men who take the most interest in improvement lines and it is from men of this stamp that animals of merit may be purchased at comparatively reasonable prices. Canadian breeders, should not delay in patronizing breeders such as these and introduce new blood of the larger, stronger type into their herds.

Mr. Fisher has been a member of the American Guernsey Cattle Club for thirty years and at present has the distinction of being the Vice-President of that organization.

While the Canadian Guernsey Cattle Club recognizes the records of the American Guernsey Cattle Club, this recognition is not receprocated. A committee has, however, been recently appointed by the American Club to meet a committee from the Canadian Club re ways and means whereby the recognition may become mutual.

In conclusion Mr. Fisher referred to the benefits that will follow in the wake of international registration. He advised Maritime breeders to advertise, boom the breed, study records, import new blood by sending a delegation to purchase eight or ten good sires and finally to show their stock at the fairs further west.

The secretary referred to the support he had always found so willingly given by the Honorary president. The present system of National Live Stock Records he said was inaugurated while Mr. Fisher was Canada's Minister of Agriculture at Ottawa.

At this juncture a unanimous vote of thanks was tendered Mr. Fisher for his stimulating and timely advice..

Mr. Corning asked Mr. Fisher to give the meeting an idea of the work that is done in the Record of Performance work by his herd, in reply to which the following figures were given:

One cow had given 10,100 lbs. milk yielding 436 lbs. fat in 9 months Another cow gave 9,000 lbs milk; 415 lbs. fat in 9 months, and another 10,000 lbs. milk; 455 lbs. fat in 8 months, and they are still going strong. Mr. Fisher hinted in passing that these cows had been bred in Nova Scotia. These records and subsequent remarks were greeted with a hearty round af applause.

A telegram from Mr. McSloy, one of Ontario's foremost Guernsey breeders, expressing regrets for not being able to attend the Annual meeting was read by the Secretary.

A resolution was passed thanking the American Cattle Club for publicity work now being carried on by them in Canadian journals.

Another resolution, following Mr. Fisher's suggestion was that the Canadian Guernsey Club also inaugurate a publicity campaign by taking permanent space in farm magazines.

Hon. Sidney Fisher, H. W. Corning and the Club's representative at the National Live Stock Records office be a committee to meet the American Club's committee re mutual recognition of international registration.

Mr. Eric Fisher expressed his pleasure at being present. He had only recently started in the business of Guernsey breeding but he hoped to follow lines of progress with the breed he had so long admired.

In recognition of Capt. Hugh Dickson's services for his King and Country during which he has had the distinction of having a German bullet pass through his head and still live to again take up the breeding of Guernsey cattle, he was made an Honorary member of the Club.

The officers elected for the ensuing year are:

Hon. President—Hon. Sidney Fisher

President. — Capt. Hugh Dickson, Truro.

Vice-President—Jas. F. Roper, Charlottetown, P.E.I.

Directors—J. A. McSloy, St. Cathrines, Ont.; Wm. Bamford, Chilliwack, B. C.; Eric Fisher, Bolton Centre, P. Q.; Allie McKay, Scotsburn, N. S., and Barry Hill, Great Village, N. S.

Robert Robertson, a former superintendent of the Experimental Station at Nappan and a practical Guernsey judge emphasized the necessity of breeding for vigor, constitution and capacity. "Get the pretty big cow not the pretty little cow" was his parting advice.

Dr. L. H. Price, of Moncton, expressed his pleasure at hearing so many good things about the breed which he has recently chosen on which to centre his breeding operations.

H. R. Brown of the Dominion Cow Testing Association gave a short talk on the value of keeping records. Agricultural Societies and farmers are frequently inquiring where good bulls may be purchased. It is only the bulls offered for sale by breeders who keep records that can be recommended. He strongly advised breeders when making sales to advise the purchasers to keep records of the production of the individuual members of their herds.

Hon. Sidney Fisher heartily approved of the suggestions offered by Mr. Brown, as he believed The Cow Testing Association was responsible for more improvement in the dairy herds of Canada than any other agency. Cow Testing and the keeping of records lead to better business methods in the other branches of farm work. Cow Testing, he said, also creates markets for good pure bred stock.

Mr. Fisher strongly advised the breeders to dispose of inferior animals and in no case offer them as breeders.

Secretary Coring and Prof. M. Cumming also had words of commendation for Mr. Brown and the work he is doing.

Allie McKay was appointed to act with the President and Secretary as the Executive Board of the Association.

The Record Board Committee appointed consists of the President and the Secretary.

Hon. Sydney and Mr. Dawson of the National Live Stock Records office were appointed representatives to the Toronto and Ottawa Fairs' Boards.

Mr. Fisher intimated that a class for Guernseys had once again been placed in the Ottawa Fair prize list, and he advised Eastern breeders to make as good a showing as possible there next fall.

Mr. Fisher, Mr. McSloy and the Secretary were appointed a committee on full fairs circuits in Ontario and Quebec.

Notes of encouragement from Guernsey circles was the theme of a few remarks by the president elect, Hugh Dickson.

Among the encouraging features noted were:—

The purchase of a 17,000 lb. Guernsey cow by Mr. McSloy.

The splendid records being made by Hon. Sidney Fisher's herd.

The purchase of a new bull by the Secretary—an animal costing well into the four figures.

Allie McKay's herd header, imported from the Island of Guernsey, whose dam had a record of upwards of 14,000 lbs. milk.

The good work being done by Messrs. Milligan in Roy Island, Pictou County.

The purchase of a bull of high quality and producing ancestry by The South Berwick Agricultural Society from parties across the line, at a higher price than was ever paid for a bull by any Agricultural Society in Nova Scotia.

LICE ON CALVES

What is the best preventative and cure for lice on calves?—C. B.

From a lengthened experience in using preventatives and cures for lice on cattle, the writer has not found anything to equal linseed oil. Go over the lice infested parts a brush saturated in the oil. It is effective, but gets the skin and hair into a dirty condition. Insect powder, if pure, are fairly effective, and pyrethrum powder is best. Mix with it flowers of sulphur and powdered tobacco leaves and, if possible, blanket the animal after treatment. Spray walls and woodwork with kerosene emulsion.

THE MARITIME FARMER

And Co-operative Dairyman
Registered Trade Mark
Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definite order for discontinuance is given,

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

RATES FOR CASUAL ADVERTISEMENTS.

Contract rates on application.

Address letters and make all checks, money orders, postal notes, etc., payable to

THE MARITIME PUBLISHING CO. or
R. D. Robinson Publishing Co., Limited
Sussex, N. B.

NOTICE TO ADVERTISERS.—Changes of ads. should reach this office one week before date of issue, in order to insure insertion.

RECEIPTS FOR FARMER SUBSCRIPTIONS

The Maritime Farmer, instead of giving you one receipt in the year for a paid subscription, sends you 24, or one every two weeks. You will find it on the GREEN COLORED LABEL on which your address appears. The date printed thereon is that on which your subscription terminates. If on payment of your subscription the date is not changed within two weeks, please notify us. No other receipt will be sent.

SELECTING A HERD SIRE

Selectng a sire to head the herd is not a simple task. Too often, however, this all-important task is reduced to the simple basis of being determined altogether by the price at which the animal can be purchased. More people, when it coms to purchasing a herd sire are interested apparently in how cheaply they can buy, than in how much they get for their money.

This reverse method of buying new herd sires is really a costly one. It seldom reuslts in the purchase of a sire that affects improvement in the herd, and unless a bull or any other herd sire is capable of affecting such improvement, he is expensive at any price. Assuming that a sire remains in a herd two or three years and affects an improvement in each of his offspring to the value of $50 to $100, an investment of $500 in the sire would be profitable. On the other hand a sire that cost only $100 and affected no increased value in his offspring would not be profitable.

The only certain method of determining whether a sire possesses the power to affect improvement in his offspring is to compare the producing ability of his daughters with those of their dams. In the case of the dairy sire this, of course, means that records of production must be kept in the herd, and that the sire will be at least four years old before any degree of positive proof of his ability may be secured. In the case of the beef sire, or of the head of the sheep flock or the swine herd, however, much of the sire's ability may be determined by the individuality and general quality of the offspring.

One good method of selecting herd sires, therefore, is to choose from among those which have already seen herd service and proven their reproducing ability by the character or the ability displayed by their offspring. This method is not always practicable, however, and it is necessary, too, to keep up the stock of service sires, to draw upon the supply of younger ones still unproven by actual service and herd test.

Practically the only means for judging the ability of a young sire before he has performed any herd service is his individuality and pedigree. As an individual, he should possess the highest qualities and most improved type of his breed. Correct conformation and a high degree of quality and breed character are always highly desirable in any herd sire.

As to the pedigree, it is important to study the records of both the sire and dam. Have they been successful breeders and producers, and what have their other sons and daughters done? Also have their ancestors in turn been successful breeders? It is not enough that merely one side of the pedigree show strength in breeding ability. In selecting the herd sire it is important that both the sire and dam be of prepotent and high producing blood lines.

One thing to remember always in purchasing herd sires is this—that it is not so much what you pay as what you take home with you that counts.

THE CANNY SCOT

Every Scottish child in training for farm work is taught to obey the biblical injunction, "Whatsoever thy hand findeth to do, do it with thy might," and so he tries to do all of his work thoroughly. It was this principle of thoroughness that led the old, white-haired Scotch stone-setter to reply to a tourist who criticised the slowness and deliberateness of his work: "I am building slow, nae doot; but, mind ye, when I get through, she'll stand for a thoosand years." It is this spirit of doing things with one's might that induces the Scottish plowman to make each furrow as straight as a string, and in the gloaming, when the day's work is done, perhaps to go back to the field and spade the corners, so that not a foot of fertile soil may fail to bear a crop. It would be well to emulate this honest thoroughness in farming operations, accomplish more enduring results, and build better for posterity.

THE WORK DAY

New York Evening Sun says:—"The miners who prefer a six-hour work day five days a week may regard work as an enemy. Thoughtful men regard work as a friend. What men think of work, however, matters as little as what they think of the weather. Inexorable nature says "work or die."

"It is good for man to work. A man without work, whatever his income, is no man at all. Work is health, appetite, sound sleep. It is health to the mind also. And in deep sorrow the Great Physician's best prescription is work."

PROVIDE DUST BOXES FOR HENS

Chickens never wash, as many other birds do, but cleanse themselves of insects by wallowing in soil. Where board or cement floors are used, some means of dusting should be provided during the winter months. For a flock of 50 to 60 fowls a dust box 3 by 5 feet or 4 by 4 feet will be found large enough in most instances, and should be placed where it can be reached by sunlight during as much of the day as possible. Fine, light, dry dust is the best, but sandy loam is good. Road dust is recommended by many but it is apt to be filthy. Coal or wood ashes may be mixed with the soil if desired.

MILK AND BEER PRICES

Milk is fast becoming a more expensive beverage than the beer of other days.—Hamilton Spectator.

Inasmuch as milk costs more to produce and is infinitely higher in food value than beer ever was or ever will be, the Spectator pays a rare compliment to the producers of milk and the foster mothers of mankind.

* * *

The farmer who starts out to acquire a big bank account and sacrifices everything and everybody to accomplish his aim does not get much enjoyment out of life. He will not have much peace of mind and his money will do him little real good. It is better to live as you go along doing all the good you can in the world, giving happiness to others and being happy yourself, even though you die a poor man. The mere making of money is not so difficult, if that is one's entire ambition, but to live an honest and up-rght life, get and give enjoyment and at the same time acquire a fortune is not so easy. But the effort is a great deal more worth while.

* * *

More than any other person the farmer works direct with the creative forces of life. This produces a strong spiritual tie between him and his means of livelihood. Under his intelligent co-operation with nature new forms of plant life are brought into existence and old ones developed to the highest point of perfection. In like manner the farmer gains a certain creative dominion over the domestic animal, giving infinite variety to each species.

* * *

Work the mine of your own home. Dig deep into the affection of the wife and little ones. Spend more time in their company. Talk with them more. Read to them and listen while they read. Discuss the world's big questions with them. Precious metal here. And don't be too busy to get better acquainted with the neighbor young folks. The man who lives near to the heart of others, lives long, well and happily.

* * *

Before it can be shown that the dairy business is a paying venture it is not only necessary to know the productivity of the herd and the value of the product, but it is equally as necessary to know the cost of maintainance. Cows cost money buildings and equipment are expensive, and feed is high. These combined expenses, together with the labor, represents a good many dollars.

* * * * *

The road to success in breeding dairy cattle is the one that leads to the picking of the breed that one naturally likes, the picking of a good family in that breed and then the selection of the best individuals of the family. When this is expertly accomplished, persistency is the watchword and in breeding live stock the term line-breeding is almost synonymous with persistency.

* * *

The one who starts a business with an ambition to succeed honestly is worthy of praise, no matter what his ambition may be, but we believe there are not a great many ambitions superior to the one that leads to the breeding of the very best and most useful animals. Men by the thousands have such an ambition, and yet those who succeed in a large way are not numerous.

* * *

A recent issue of the Maine Farmer says:—"We have a few things to be thankful for, and one is that there are not many breeders who have forsaken the animal for the pedigree.

CANADIAN GUERNSEY BREEDERS IN ANNUAL CONVENTION

(Continued from page 225)

Mr. Barry Hill is also importing some Guernseys from the United States.

Mr. Banks of South Berwick said his Society had no regrets for buying the bull in question; he was hopeful that the new bull would help develop their herds in production and in vigor and conformation.

Mr. Milligan expressed his pleasure at being present. He had started Guernsey breeding only four years ago and now he owned 17 purebreds.

Mr. Robertson again urged the elimination of the scrub purebreds.

Mr. Corning introduced the question of having Guernsey pedigrees extended to contain more family history and Mr. Fisher was appointed to consult with the Records officials re this desirable feature.

Mr. Fisher advised the breeders to work for concerted efforts for the community centre breeding of Guernseys and cited several notable successes that had been achieved by breeders in other localities along this line.

MARITIME BEEKEEPERS

The re-organization meeting of The Maritime Beekeepers' Association was held in the Board Room of the Winter Fair Building, Amherst, on Tuesday, December 16th. L. T. Floyd, Provincial Apiarist for New Brunswick presided and was also elected president for the ensuing year.

Vice-Presidents elected are G. B. Baker, Amherst, N. S.; Harry Miller, Tracey Mills, N. B., and Harold Newsom, Charlottetown, P. E. I.

Sec.-Treas.—Evan Craig, Kentville, N. S.

Efforts will be put forth to get in touch with every beekeeper in the three provinces, in order to interest thm in the association, and to apprise them of the results that Mr. Floyd and Mr. Craig are accomplishing in New Brunswick and Nova Scotia, particularly with respect to the extermination of foul brood. The result of recent surveys re the foul brood situation in the provinces will be furnished the vice presidents for the respective provinces to pass on to the beekeepers. Every beekeeper should get this information. Ask for it.

THE DEVELOPMENT OF WHEAT GROWING IN NEW BRUNSWICK

Though popular attention has been attracted by the extent of New Brunswick's potato growing industry, very little is known of the quiet development taking place in wheat-growing.

The crop report for 1918 showed an increase for that year of nearly four times the acreage sown to wheat over the average of the preceding five years, while the estimate for 1919 shows the expansion to be well maintained. More than three times the acreage of the five-year average were sown, the area being 43,000 acres.

Certain parts of the Province are well adapted to wheat growing and despite the general idea that wheat does not pay so well as oats, its culture is steadily increasing. As a pastry-flour the local product is unsurpassed by that of western mills, while in many farm-homes bread-flour ground at these local mills is used the year round. A test made recently by the largest biscuit manufactory in the Province of home-grown wheat milled at a local roller-process mill, gave very gratifying results. The possibility of a large trade in the consumption of local flour is herein opened to our farmers. Some immense crops are grown, which, at the present price of flour and its bye-products return to the grower a handsome net profit on each acre. As an instance there has come to our notice what is believed to be the highest acre yield of spring wheat ever recorded in Eastern Canada. Mr. R. O'Leary produced on his farm at Richibucto, two hundred and twenty-five bushels of excellent White Fife wheat on four acres, an average yield of fifty-six bushels per acre. To make a barrel of flour only five bushels of such wheat is required, and the bye-product sells today for three cents a pound. That is, the returns after deducting the cost of milling, approximate two hundred dollars per acre for this crop.

An indication of the expansion of wheat-growing may also be inferred from the fact that four new grist-mills have begun operating this year. As a part of the production policy of the Department of Agriculture, assistance in the way of a bonus to wheat mills is granted to those that install and operate for a period of five years to the satisfaction of the Minister of Agriculture the Hungarian, or roller-system of extraction.

The plans of these four mills were approved of by the Minister, and in the construction they have been aided by the Government. These are equipped with modern roller flour mill machinery and are up-to-date in every respect. Electric motors furnish the power to at least three roller-process mills now operating in the Province. The latest mill to install electricity as the power source was built this year at Richibucto by Mr. B. J. Johnston.

Though there are now thirty-four mills equipped with machinery of the roller-process type operated in the Province, thirty of which received Government aid, there are yet good wheat-growing sections that have inadequate milling facilities. Generally speaking, this condition has come about because of one or more of the following conditions:

Some of the mills established several years ago have been burned or partly dismantled, and in consequence farmers are obliged to haul their wheat long distances to have it milled. In other localities, owing to changes in the type of farming carried on, wheat-growing gained in favor and is sown to a larger extent than formerly.

Frequently after bringing his wheat a long distance, the farmer finds the mill piled up with grain waiting to be ground and must make a second trip to procure his grist. On the other hand, the miller says that his machinery is idle a considerable part of the time.

Nevertheless, investigation shows that this idle period occurs in the summer months after the farmer's granary is emptied. Short periods of comparative idleness and irregularity of the amount of custom work being due to seasonal work of the farmers' teams.

The actual rendered service of a mill to a farm community is quite a different thing as compared with its rated capacity for a continuous 24 hour running. Consequently, an estimate of the extent of country served based upon the mills rated capacity is reduced two-thirds during the short days of autumn and winter when the bulk of the wheat crop is taken to the mill.

The economics of the policy for the encouragement to wheat growing suggests that an adjustment of differences lies in the steady expansion of the wheat-growing industry. The possibility is presented of a large trade in the consumption of home-grown wheat flour by our local manufactories such as biscuit works and pastry bakeries, and also of reducing the immense quantities of wheat bye-products now purchased from outside the Province, were the local millers supplied with enough wheat to keep their machinery busy.

The location and the rated capacity in barrel flour each 24 hours of the roller-process mills now operating is as follows:

Albert—Elgin (50).*

Carleton—Woodstock (50). Centerville (125). Bristol (50). Lakeville (50). Coldstream (50).

Gloucester—Riordon (35). Caraquet (35). Petit Rocher (75). Bathurst (50).

Kent—Buctouche—two mills (50-75). Richibucto (50)*. Cail's (25)*. South Branch (50). St. Anthony (50).

Madawaska—Power's Creek (35). Edmundston (35). The Ledges (50). Caron Brook (50).

Northumberland—Newcastle (50). Boiestown (35). Rogersville (25). Chatham (50)*.

Restigouche—Campbellton (25).

St. John—St. John (100).

Victoria—Four Falls (50).

Westmorland—Port Elgin (50). Moncton (50). Shediac (25).

York—Fredericton (25). Harvey (50). Monument Settlement (50). Pinder (50)*.

Fredericton, N. B.

BUY BREEDERS AT HOME

By Hon. Walter M. Lea

Applications are frequently made to the Department for assistance in importing breeding animals from the upper provinces, and when a scarcity actually exists, it is quite proper to have such importations brought here, but those in need of good males of a dairy or beef breed of cattle, should enquire of our breeders before arranging to make such purchase, as we have animals bred and raised here that may be secured very much below the cost of those of equal merit raised in the upper provinces. I have recently visited some of their most noted herds from which animals have been purchased for over $10,000, and I am convinced that most of the animals I saw there priced below from $300.00 to $500.00 would be considered in our best Island herds a cull. Many of these animals make their official seven days' tests under hot house conditions by expert feeders, and the records should go rather to the men than the cows making them. A yearly record of milk and fat is all that any intelligent breeder would care to purchase animals on.

I saw by an R. O. P. inspector's report quite recently where Mr. Howard Callbeck, of Tryon, has a heifer 25 months old that has produced in 30 days 1,600 lbs. milk, testing 4.5 per cent fat or 90 lbs. butter during this time at a cost of feed not exceeding 50 per cent of the value of this product. The ancestors of this animal were bred for four generation in this province, and we have many such that may be obtained here that the owner can inspect before purchasing, and see that they are getting a good individual as well as buying a pedigree on paper.

LAND CLEARING

Land clearing is not, under present conditions, a popular occupation amongst land owners. The high cost of labor, powder, and other equipment makes it almost prohibitive. Heavily timbered lands cost so much to clear that farmers prefer renting or purchasing cleared areas rather than undertaking the strenuous labor entailed in clearing. The only real inducement for expending this labor under present conditions is the ambition of home making and improving.

The first operation necessary is to clean up all undergrowth. This consists of cutting the brush and piling to dry. Then all the standing timber, except the large trees, should be cut and fuel made of the most desirable. The boughs should be then piled in windrows, along with the undergrowth around the old rotten logs, and fired when the heap is dry.

The next operation is to fell the large trees, and, if not to be uitilized for lumber, they should be spilt with powder and burned. While burning, the green boughs and remaining brush should be destroyed, when, with reasonable success, practically everything except the stumps will disappear. It is well to get the work thoroughly completed at this stage so that no small, rotten material remains, to be covered up when the stumps are blasted. Care should be taken during all burning to keep the fire on small areas so that the least possible amount of humus will be destroyed.

Removing stumps entails the major portion of the expense in connection with clearing. There are three general methods practised in carrying on this work, powder being used more or less in each case. Those who have considerable capital at their disposal and wish to clear a large tract favor the use of a donkey engine, employing powder to assist with the large stumps and the engine hauls them bodily from the ground and places them in huge piles. This method has a tendency to cover the surface soil and hence decreases the value of the land for a few years.

The second method is used to best advantage where a small tract is to be cleared rapidly. All the stumps are first blasted, then by the use of blocks, cables and horses the small stumps are pulled and piled in the holes left when the large one are blasted. By this means the fire is confined to subsoil burning and the fir stumps with so much pitch make it possible to burn all material that can be hauled and piled in these holes. If the blasting is properly done, the stumps are blown out without covering any great amount of surface soil. This work is best accomplished when the soil is damp. This method requires the most powerful powder and for this reason is expensive.

The third method employed is the least expensive. It consists of seeding down to grass and clover between the stumps and using the land for pasture for a number of years. This allows the stumps to rot, when they are more easily removed. Less labor and powder are required by this method but it is very slow and tedious.

After the stumps are disposed of all the remaining sticks and roots should be hauled and piled, the holes filled by the use of a team and scraper, keeping as much of the surface soil on top as posisble. Then the land may be ploughed, when more roots will appear and must be removed. Next the land may be disced and harrowed several times, when it should be in proper condition for seeding.—W. H. Hicks, Supt. Experimental Farm, Agassiz, B. C.

CUTTING BRUSH AND VINE PRUNING

What two months of the year can I cut brush so that it will not sprout?

What time of the year should I trim a grape vine?—J. L.

The readiness of sprouting after cutting depends more upon the varieties of trees that form the brush you wish to cut, than upon the time they the cut. Some varieties sprout more readily than others, and the time for one is not so well fitted for another. On the average the best time to cut brush is in the fall and early winter.

The early spring time, while the plant is dormant, is the best time to prune the grape vine, but before a grower can grow fruit successfully he must study his varieties and their methods of bearing and ripening. The fundamental principle of pruning grapes is based upon the fact that the fruit is borne in a few clusters near the base of the growing shoots of the season, which spring from wood of last year's growth. The usual practice throughout the Province of Ontario is to do most of the pruning during the months of January, February and March. Any time during these months will be quite satisfactory except on very cold days, when the vines are very brittle from heavy freezing.

An Iowa farmer is responsible for the statement that if a newly purchased rope is so kinky that it cannot be used, the twist may be removed by tying the rope to a wagon and dragging it about on the ground.

LIVE STOCK.

SALT ESSENTIAL TO ANIMALS' HEALTH

"Nae worth his saw't" is an old country saying meant to indicate the inferior capabilities of the individual it refers to. The maxim tells a story of abundance of salt, and the commonplace value that is placed upon it in Scottish farming circles. The country is surrounded by such immense volumes of ocean water that the air is permeated with its salty influence. A pinch of salt is not counted of the same value as it is with the Canadian farmer.

Scottish farms are in the "pickle" all the time, no farm being so far away from the effects of the briny breezes that periodically come up the valleys good and hard. When the wind blows in from the west, or points between that and north, you can "lick" the salt from your lips with the tongue.

I was only a week or two in Canada when I found that my experience in the pickled condition was valueless for the health of the live stock on this side, so far from the Atlantic ocean. I made mistakes in my first attempt to look after the welfare of three to four hundred cattle, but when I caught on to the idea of substituting the salt barrel for the salt laden air of former experience, the domestic quiet of well cared for and contented animals returned, and I made certain it would never leave them again. This is how I got educated to the necessity of adapting myself to new conditions and the necessity of liberal doses of salt to live stock was one of the early lessons.

The Saltless Farm

Since then I have always been on the outlook for the saltless farmer. I caught one unawares during the past summer while holidaying. One day I had occasion to pass through a neighbor's pasture where I was immediately surrounded by a wild-eyed herd of cattle. It was with difficulty I could get my way to the fence side. These animals weer poverty stricken for lack of salt and their gaunt, eager, craving look for something was very apparent. I discovered it was salt they were after. I had been assisting my host in storing some barrels of salt, and the high strung sense in the cattle discovered the meagre trail left by the barrels' contact with my hands and clothing.

Occasionally there came a visitor to that farm, and his mode of conveyance was by horse and buggy. I looked after his horse on these visits, and discovered that he also was another specimen of the "fresh" type of farmer that abound in some districts. That horse ate up all the stable furnishings within reach of the halter rope. He refused to look at water, oats, or hay; gave them the go by to gnaw at the barn furniture. They were salt soaked, and every spot on the woodwork that had come in direct contact with the regular salt ration given to all the animals on the farm, this stranger would eat a hole clean through the woodwork. Every farmer in the district owned a motor car to take them around in their visitations, the one exception was the owner of this horse. One could determine with remarkable accuracy the reason why. The farmer had not discovered that the way to a comfortable living on the farm was got by the comfort and contentment his management furnished for the animals he kept on it.

Help Yourself Method

Since I hit the salt problem of Canada, I have made some discoveries of my own. There seemed to be very little written about that topic, so that, for me, private investigation was necessary. Like all animals, human and otherwise, cattle, horses, sheep and pigs have individual likings and dislikes for some articles of food, and salt has its partisans in degree. They ought, therefore, to have the right to choose the amount they individually desire.

Salt should be placed where the stock can get what they want every day. Some of the cows that were giving the larger quantities of milk in the herd I had under my charge ate half a pound of salt daily while others giving an equal amount of milk consumed only a small fraction of this amount of salt. The cow that ate the half pound of salt daily did not give the heavy milk flow without the salt. There are cows and cows and it is up to the dairyman to study tastes and arrange the menu accordingly.

I have seen farmers dosing with salt every ration they set before their cows. But I prefer the idea of the purveyor at our own tables who sets the salt cellar on the table and let us please ourselves, according to individual tastes. Would you consider it the work of an expert cook to salt all that was set before you indiscriminately? I should think not. But this is what the farmer does who splashes salt recklessly over hay, ensilage, bran and concentrated foods he sets before his cows. In giving salt to cows, get the idea of the salt cellar, "help yourself human way," and place salt in a way that the cow can fulfill this idea.

Salt helps to keep down worms in the digestive tract of growing animals, and also promotes that laxative condition so desirable in milking cows. Scientists tell us that the basic element in it, sodium, offsets in some way the deleterious effects of a preponderance of its half brother, potassium, in cereals and grain preparations we eat every day.

See that the stock are having their "licking good," when they so desire. Get the habit of placing the salt before them and save your stock from having the unthrifty look that very visibly expresses the plaint "salt please."—By Jas. Henry.

SELECTING FOUNDATION SHEEP

To establish an individual type in a flock, is a matter of valuable importance to sheep breeders. In this branch of animal husbandry the greatest profit, either for market or breeding purposes, comes to those who produce the type and quality of stock most in demand. Unless sheep of uniform and superior quality are produced the greatest success can not be achieved Far too little attention is directed to sorting and selecting breeding stock to establish type in the flock.

In the selection of ewes to constitute the breeding flock, attention ought to be given to sorting out animals that give evidence of uniformity and of the type desired. There are a few individuals in every flock that more nearly approach the type desired to be established than others. These ewes should be picked out first and placed by themselves to serve in the capacity of an ideal. If a careful study is made of the ewes that most nearly approach the desired type, it is an easy matter to select others that show evidence of similar conformation. Many do not pay enough attention to the question of uniformity of type in selecting ewes to keep, gasing their judgment of the individuals more on size and thrift. These are excellent qualities and should, of course, be present to a marked degree in every animal selected, but uniformity is an equally important factor, even where the sheep are raised for market purposes only.

Quite often the condition of the ewes is made the guide for their disposition when selecting, and where this is the case it is likely to be the deepest milking ewes which are discarded, especially if they are thin in flesh. In such cases the ewes which become reduced in flesh through the feeding of one or two lusty lambs have not recuperated and do not look as well as the ewes which did not provide their lambs with as much nourishment, but have put a good layer of flesh on their backs. Thus the very best ewes in the flock may be sacrificed to make room for those of better appearance, but which compare unfavorably with them from the standpoint of profitable production. If one keeps watch of the flock and marks the ewes which brought poor, scrawny lambs, this danger may be minimized. Of course, in some instances there may be reasons for this other than the milking qualities of the ewes, but the time to judge of that point is before the ewes are mated.

There are, of course, other features entering into the selection of the ewes to be discarded. One of the most important of these is age. There is a strong tendency on the part of many to discard middle-aged ewes. The younger ewes will shear better fleeces and will add to the appearance of the flock somewhat, and, other things being equal, they should, of course, be given the preference. But it is a mistake to discard the middle-aged ewe that has given abundant evidence of her value as a producer for one whose powers in this direction are unknown because untried. Those who maintain grade flocks, and direct special attention to the production of wool and mutton, should make a careful study of market conditions and endeavor to determine the quality of stock that commands the highest price, and then concentrate their efforts on producing that which the market requires and which returns to the producer the largest net profit.

In selecting a ram a great deal can be accomplished in the way of establishing type in the flock. Each ewe influences establishing type the extent of transmitting to her progeny her desirable characteristics, while the ram exerts influence over every lamb produced in the flock. The ram should be selected with regard to strengthening the weaker qualities in the ewes. In general terms, the ram should possess much stronger evidence of the type to be established than is found in the ewes, that he may not only strengthen the weaker qualities in the latter, but permanently establish them in the progeny.

There are a few essential qualities that should be carefully considered in selecting a type of sheep for the production of wool and mutton for the market. In the first place, we want a sheep with strong constitution. Many are misled in selecting breeding stock thinking that strong constitution is confined to large framed animals. This, however, is not always true. Many times the most vigorous ewes are below the average in size. In general, the body should be well-proportioned. The ribs should be well-sprung, giving pleanty of space for the digestive and respiratory organs. A dense covering of fleece over the body is a prime requisite, and the wool should be of good quality and length. Every reader of The Maritime Farmer who raises sheep should strive to establish uniform type in the flock. If the lambs are grown for market, and are uniform in type, a better price can be realized for the entire crop. Wool buyers are always ready to pay the highest market price for a uniform grade of wool.

YOU CAN SELL ALL YOUR MILK

REGISTERED TRADE MARK

And Raise your Calves on

Blatchford's Calf Meal

THE NEXT BEST THING TO MILK

BLATCHFORD'S CALF MEAL supplies in easily assimilated form all the necessary food elements the calf requires for rapid and healthy growth.

It is the only calf meal that is properly cooked and prepared for easy digestion.

If your local dealer cannot supply you write for interesting literature.

SOME PIGS NEVER DO WELL.—WHAT CHECKS THEIR GROWTH?

One of the greatest known enemies of hogs is lice. This is especially true of the growing pig. A pig that is infested with the pests never does well, but is always a runt, consuming the maximu mof feed and putting on the maximum of feed and putting on kept off pigs, but if we neglect to rid the pigs of lice, we are almost certain to never try to keep lice off the grown hogs. Right now is a good time to start and kill the lice on every hog on the place, and then make a resolution never to tolerate lice again.

We can catch the pigs and rub axle grease on them about every fortnight, and this will keep the lice off them. For the large hogs a dipping vat is best, but vats are expensive, and not available to every farmer. For this reason, the writer uses a standard dip sprayed upon the hogs. This has to be repeated more frequently than dipping would have to be, as some of the lice are not reached. A standard dip, ready prepared for diluting with water, is best to use, and the cheapest in the long run because of its efficiency, but a kerosene emulsion may be used if you do not care to use the standard dip.

The method of preparing the emulsion is to dissolve in boiling water a pound of laundry soap. It will take from a half gallon to a gallon of water to properly dissolve the soap. When this has cooled, stir into it a pint of kerosene. When this is well emulsified, pour it in 10 gallons of water, making 11 gallons of the miture. This is not very strong and is very inexpensive, so may be used freely. It will kill lice immediately, but has to be repeated rather often, as it does to kill lice on other stock, though I t okill lice on other stock, though I do not assert that it will kill ticks. I once killed all the lice on a horse by this method, and from a thin, rough-coated, bad-looking nag he soon developed into a sleek-looking animal. Crude oil may be used instead of kerosene. In using the kerosene mixture you should remember that kerosene will blister if too much is used. So keep the hogs in the shade after the emulsion is sprayed on, until all the kerosene has evaporated. In greasing the pigs I have often used a mixture of one part kerosene and one part axle grease. This will not blister unless used excessively.

In all cases care must be used to get the remedy to the spot. Lice breed in the creases behind the ears and btween the legs, especially, and these parts must be reached if the remedy is to do its work.—A. G.

WHY USE A PURE BRED SIRE?—REASONS GIVEN BY EXPERIENCED BREEDER

1. A pure bred sire represents a pure breed originated and developed for a specific purpose, and possesses the prepotence of power of transmitting to his offspring the type, characteristis and specific purpose of his breed. Common or unimproved scrub animals have background of careful selection and breeding possessed by pure breds; the offspring of scrubs

inherit only the mediocrity of their parents.

2. The advantage of breed is that a pure bred sire representing it can be chosen for a specific purpose and with a view to his suitability for a particular purpose in a known environment, climate or class of farming.

3. Improvement of live stock by grading up can be done by persistent use of pure bred sires of a given breed only. Five consecutive top crosses of the purc blood of the same breed constitutes practical purity of blood, and this is all that is required by a majority of practical breeders.

4. A grade or scrub sire cannot be expected to transmit qualities which are not strongly present in his own makeup therefore the grade or scrub sire can only produce a scrub. Why not use pure bred sires and supply the demands of the market at an increased profit?

5. A grade sire possesses mixed blood, each strain warring for supremacy. When he is used there is no certainty as to the result. The progeny may "favor" any strain in the sire, good or bad, but the results of such breeding cannot be controlled. No upward progress can accrue from the use of grade sires.

6. Uniformity in farm products, as regards type and quality means attractiveness in the market and consequent popularity. Prime beef brings a high price because it is in great demand by a discriminating trade. The white eggs of the Leghorn are favored in many markets because of their uniformity in size and color. The pure bred sire by his breed and prepotency insures this uniformity.

7. The farmer or breeder knows and apreciates the value of a recognized advertised trade mark.

NEW BEGINNER IN STOCK BREEDING

In the breeding of pure bred live stock, the study of pedigrees not only gives interest and pleasure to the farmer, but also added profit. Philosophers tell us that self reliance is the basis of success, and the philosophy is true in stock breeding. To be self reliant one must be well informed, and to become expert in judging pedigrees, as in judging farm animals, requires must study and experience.

When the young breeder has made up his mind to take the initial step, he should be careful to see that the animal he buys is likely to suit his purpose. He cannot begin aright without making a careful study of the history of his chosen breed. He must become familiar with the individuals, and blood lines which have been instrumental in building up the breed. Then when he goes out to buy, he should be careful to buy only what he has set out to acquire. It is wonderful the amount of good advice one can get when he sets out on a mission of this kind. Everyone is more or less a fancier of some breed, many are willing to give advice, and many are the assurances that can be got "That this is the very animal to buy," so that to succeed, one has to work out his own salvation.

Much in regard to popular pedigrees can be learned at fairs and sales. A word of caution here, however, may be necessary, due to the fact that breeders frequently become over enthusiastic on "family" blood-lines, regardless of how remote they may be. A careful examination of the pictures of the breed's best specimens will help. The beginner must become familiar with the names of the breeders of noted individuals, both past and present, and look for these names in a pedigree. A thorough understanding of pedigrees requires constant study, and one becomes expert only after he has examined and analyzed dozens of tabulated pedigrees.

Sires contribute about seven-eighths of the heredity and in analyzing a pedigree the beginner must consider carefully the sires, grandsires and great grandsires. The names of famous individuals should be looked for in these first three generations, but what they are bred with should not be overlooked. An undesirable outcross will spoil them for the purpose if it happens in the line of the animal one has in mind to buy. Though sires, to a great extent, determine the value of a pedigree, the females appearing must not be overlooked. Certain bloodlines are known to blend well with one another, and a breeder should look for these in a pedigree. Family names, especially if derived from females, which appear as far back as the tenth or fifteenth generation are of little value. They are misleading, especially to the beginner. To be known to be the member of the "family" of which a particular female was the foundation, does not count for much; the tenth generation would contain less than one tenth of one per cent. of that female's bloodline. The same is true as regards the sire. Credit of the sire is fast becoming more popular with breeders; family connections on the female side are not counted of so much value. Credit should be given the greatest distinction in the founding or building up of a herd or stud, to sires that appear in the first two or three generations through performance in the herd or stud, in the show ring, or in official testing for milk production in dairy breeds.

The boy who has not had the chance to attend an agricultural college need not despair of his chance to get along as a breeder of the first order. The present day high schools where the breeders art can be learned are found in the show-ring and the sale-ring and opportunities to visit these should not be lost. The young aspirant to breeding fame, should occupy his time at the fair in doing some judging on his own account. He will do well to try his hand at examining and placing the entries in each class in his own mind, and see wherein he differs from the judge when his decision is made. The capable judge who fully realizes the full purport of his work in the show-ring, as an educative medium, will be quite willing to give opportunity to discuss wth him the reason of his placings if they differ from his effort. These explanations are of inestimable value to one who is new at the business and willing to learn.

There are many ways of gaining the knowledge necessary to the breeders art, not only to the fair and sale, but a visit to farms, run by progressive breeders, and a talk with the owners and herdsmen will help to give valuable lessons that cannot be got from books or agricultural papers. Genius in stock breeding, as in any other industry, is nothing more than deep interest in the work, accompanied by persistent effort.

Special Offering

Maple Green Farm Holsteins

On account of the great shortage in the supply of milk in our home town, we have decided (with regret) to dispose of our entire crop of Bull and heifer calves.

If taken inside of the next 30 days will price them away below their value.

The Dams of these calves are now running in the R. O. P., and the last official test conducted by the R. O. P. inspector showed an average test of 4.62% fat for the lot.

All are sired by our 32.32 lb. herd sire "King Korndyke Johanna", whose Dam is a full sister to Canada's Champion R. O. P. cow, "Jemima Johanna of Riverside". Milk in 365 days 30373; butter in 365 days, 1280 lbs.

TWO CENTS A WORD COLUMN

WANTED—One good turkey hen for breeding purposes. ARTHUR E. FERGUSON, West Bathurst, N. B.

Sell Those Horses Now!

SELL them and save their feed—save chores—save the time spent in giving them the exercise they need to harden them up for Spring work.

Get a Cletrac instead. Get it now—be sure of delivery—work it on odd jobs and get used to it. You and your Cletrac, once you're well acquainted, will both be keener for weeks of steady, fast work. Put in waste chore-time learning to get 100% out of your tractor and add that to the profit you'll make from the feed you save.

The Cletrac will keep on saving you money all year. It isn't a tractor that shirks the unhandy jobs and makes you keep a lot of horses, too.

In all the corners and sticky places, as well as on big work in the open, it's *there* with plenty of pull. Its long wide tracks and its economical weight get over the grades with power to spare. Burns coal oil, (kerosene), or distillate.

There's a book, "Selecting Your Tractor," that you ought to have. Send for it to-day, *or ask the Cletrac dealer.*

THE MARITIME SHEEP BREEDERS' ASSOCIATION MEETS WITH THE M. S. B. A.

A meeting of sheep men interested in the Maritime Breeders' Association was held in the Winter Fair Board Room, Amherst, on December 18th. The meeting was called to order by the Secretary, S. A. Logan, and J. M. Laird was appointed chairman.

The Secretary referred to the fact that there had not been a meeting of the Association sinc December, 1915, and suggested that the Association merge with the Maritime Stock Breeders Association, as the latter body included our most prominent members and the sheepmen's interests would be well looked after without the necessity of overlapping and conducting a multiplicity of organization.

Mr. Burdee Goodwin did not favor Mr. Logan's suggestion as he thought the sheepmen should reorganize and maintain their Association.

On motion it was unanimously agreed to merger as suggested by Mr. Logan and that the Association funds be paid into the treasury of the M. S. B. A.

SORES ON PIGS

Can you tell me what to do for pigs that haev a sort of itch? It comes in the form of small pimples, and these fill up yith pus and then break open and bleed and form a scab. One of my pigs had those on his ears. I used borax in powdered form and sores all went away, but are now returning.—C. W.

Reply.—Wet and filth are common causes for such a condition and in that case the disease is termed "pitch mange." Sunscald tends to start such a trouble, and then the sore places become infected with filth germs. We cannot say for suure that this is the case with your pigs, as some other disease may have somewhat similar symptoms; but not matter what may be the exact cause, it would be well to dip the pigs in a 1-100 solution of coal tar dip to which add enough crude oil to coat the surface. Scrub the affected skin with a brush when the pigs are in the tub. Reepat the treatment as required, and keep the pigs out of wet and filth.

SAND FATAL TO HOGS

It cost a Nebraska farmer $1,000 to learn that hogs must be supplied with mineral matter.

Hogs to this value were kept in feeding pens where they were neither supplied mineral foods nor given an opportunity to range for them. One day a wagon load of sand was dumped into the pens to be used for repair work. Shortly after, the animals were discovered dead and on post mortem examination the large intestines were found to be gorged with sand.

Swine growers should see to it that their animals have access to mineral foods. Where a considerable range is provided the animals are often able to find such foods for themselves but in any event it is a safe plan to give the hogs plenty of mineral matter in some form.

The following mixture is recommended by A. G. Skinner of the Extension Service of Connecticut Agricultural College at Storrs: Three bushels of charcoal, two quarts of air slaked lime, eight pounds of salt, one bushel of wood ashes.—Press Bulletin, Connecticut Agricultural College.

MINK 1,000 skins wanted. Will pay $12.00 to $15.00 average. Coon $3.00 to $10.00. Rats (lawfully taken) $2.00 to $2.50 average. Write for price list today.

DAIRYING.

DAIRYMEN HOLD ROUND TABLE SMOKER AT AMHERST

The contestants in the Dairy Test at Amherst held a smoker on the evening of December 17th. Mr. Harvey Mitchell, of the Dairy Division, was master of ceremonies. The object of the smoker was to have a round table talk on the methods of conducting the Dairy Tests at Amherst and receive suggestions as to how improvements may be made to better conditions for future events. The contestants were unanimous in their aproval of the methods followed and cleriral work of the testing room staff.

Mr. John Retson mooted the idea that the system of locking the Dairy stables' doors as soon as the attendants had completed their chores and leaving the cows in quietness until the next chore period, with the door keeper paying a casual visit between times to watch for any trouble that might arise, was preferable to having so many attendants in the stables throughout the entire period. This practice he considered detrimental to the best results, owing to the commotion which prevails and which should be foreign to the dairy barn. While it was generally conceded that there was altogether too much commotion during the test period, the cow owners and attendants felt that they would not like to be shut out as by studying their cows' action after feeding they were better prepared to judge the quantity of food that should be given each individual at the following feeding period. It was suggested that in future it might me well to limit admission to the dairy stables between milking periods to the managing owner or attendant of each herd. The contestants realize that this is a matter that may easily be arranged with the Sock Breeders' Association to the satisfaction of all concerned.

The next question that came up for discussion was re the unsatisfactory condition of the dairy stables. It was thought, and rightly so, that no cow can do her best in the dark, unfloored stables as they now exist, with no control of temperature. Nor could the visitors see the cows to the best advantage.

A committee consisting of Bert R. Brown, R. L. Hicks, Arthur Dickie, W. A. MacKay and James Bremner was appointed to draft a resolution expressing the desires of the dairymen re improvements to the dairy stables, that might be presented to the Maritime Stock Breeders' Association. The committee retired and on their return presented a resolution asking that the present stables be torn down and that a new building be erected covering the site of the two old dairy stables and the intervening space. That the building be properly equipped with cement floors and fittings such as are found in well appointed barns with ample provision for control of temperature, abundance of light and if thought advisable, sleeping accommodation for the attendants. After some discussion the resolution was adopted. Some of the speakers who took part in the discussion referred to the fact that in the event of a new building being erected it would be well to locate along side the railway tracks where there would be ample provision for loading and unloading stock.

Another question dealt with dissatisfactions that frequently arise through seemingly unnecessary delay of stock in transit and careless shunting in terminal yards. A resolution was adpoted asking the management to bring this matter to the attention of the management of the Railways.

While the resolution committee were in session the dairymen were briefly addressed by W. F. Stephen, Secretary of the Canadian Ayrshire Breeders' Association, who in referring to the condition or the Winter Fair Dairy Stables observed that provision must be made for proper surroundings if individuals from accredited herds are to be shown at future shows. He advised his hearers to put forth their best efforts to maintain their herds free from tuberculosis. He advised every dairyman to have every animal in his herd tested for T. B. as soon as possible, for, if reacters are found in the herd the loss will not be so great as it will be if the testing is delayed until the whole herd is affected. Buyers are looking for and demanding disease free animals and it is well to cater to that demand. A herd with a clean record, he said, was worth at least fifty per cent. more than the herd that cannot show a clean bill of health.

Dairymen had done wonderful work during the war time conditions and have earned every cent they have received for their produce, despite the fact that one frequently hears them referred to as profiteers. This cry had practically disappeared when the Board of Commerce took the evidence of men who gave true statements of fact re the cost of milk production.

Dairymen, he said, should be better advertisers and breed and feed for larger production. The problem of the indifferent man is always with us and the dairymen are helping to overcome this indifference by progressive measures and good example.

Dairymen must not be content to rest on their oars.. "Good enough" is not good enough. The scrub bull must be assailed from every angle until his death knell is sounded. In conclusion Mr. Stephen expressed the hope that at next year's fair the cows would be quartered under more favorable conditions.

Dr. Hugh McPherson followed Mr. Stephen with an outline of the scrub bull control law in Nova Scotia, after which Prof .J. M. Trueman, on being called upon for a few remarks, referred to the educational features of the Fair and the splendid opportunity it affords our farmers to get acquainted. To do their best, he had no hesitancy in saying, the cows must be comfortably housed. The prices farmers are receiving for their produce now-a-days does not put them in the profiteering class, but conditions are of the character that omen well for the future of the industry and warrants a spirit of optimism for never again will the margin of profit between cost of production and cash received for the product be as narrow as it was in the past. The average farmer, he said, had no business to tamper with a pure bred herd. The great improvement must come from the progressive breeders who must continue to supply the pure bred bulls that should head the herd on every farm. He advised the breeders to do away with any pure bred scrubs they might locate in their herds.

Agricultural Societies are fast becoming cognizant of the wisdom of purchasing only the very best individuals available.

Among others who took part in the discussions were Hon. W. M. Lea, E. P. Bradt, A. E. Trites and Harvey Mitchell. Mr. Mitchell referred to the value of the dairy test and favorably contrasted the success of the Amherst test with those at Guelph and Ottawa.

PLANNING A SANITARY STABLE FOR INCREASED MILK PRODUCTION

..Does it matter what conditions are in the stable? Can we produce just as good milk and just as much of it, in barns that can be called unsanitary as in those in which conditions are more ideal?

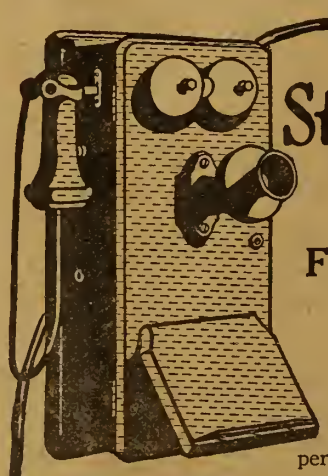
A few moments thought will assuredly show uus the conditions in the stable make every possible difference, not only the quality of the milk produced, hut to the quantity also.

Can a carpenter do a neat job with

O.V. BRAND
Pure Wool Underwear

O.V. (Ottawa Valley) brand has been worn for fifteen years by Canada's nation builders—on railroads, farms and the Empire's battlefields; in mines and in construction camps. Made for warmth and durability, in medium and heavy weights, in combinations and two piece suits. Guarantee with every garment. Moderate prices.

Sold throughout the wholesale trade only.



Stromberg-Carlson TELEPHONES

For City, Village and Farm

These are the ideal instruments for local or long distance work.

When you talk over a Stromberg-Carlson telephone you immediately sense its clear, powerful transmitting qualities. Transmitter and receiver are standard commercial instruments that give perfect satisfaction over local or long-distance lines. Your message goes over the wires with distinctness. High efficiency and convenience are characteristics of every Stromberg Telephone.

SEND FOR FREE BOOK No. 95

It describes all Stromberg Apparatus. Explains how to install and take care of your telephones. Tells how to organize and equip a party line among your neighbors and explains just why the experience gained in building over 2,500,000 Stromberg Telephones guaranteee the kind of service you need.

poor, inconvenient and worn out tools? Can a manufacturer turn out an accurate product if his factory is badly arranged, his equipment out of date, and his planning of his work poorly thought out? Of course he cannot. If this is the case in other industries why should it be any different with us? Rather, let us say, it applies with particular force to us. The cow is not an unfeeling combination of steel and wood. She is highly strung and sensitive. She is engaged in one of the most complicated manufacturing processes known. She has to take into her system a great variety of raw materials, in the form of fresh air, water and food. She is surrounded by a great variety of influences, any one of which will affect her output. She turns out one of the most perfect products known to man; the one product, so scientists tell us which is capable of maintaining health without anything else added to it.

The more highly strung the cow and the greater her capacity for milk production, the more sensitive she will be to unsanitary quarters, discomfort, dirt, lack of fresh air, defective feeding and poor methods of watering.

Does the Average Cow Pay?

The average cow is a "boarder," pure and simple. If her owner breaks even on her, that is al lhe will ever do, unless he increases her production. Many attempts have been made to estimate the cost of producing milk, but such figures are almost sure to be misleading because of the wide variation in the circumstances under which it is produced and the difficulty of obtaining accurate figures which will apply to the ordinary farm.

It can be said, however, without any doubt in the matter, that the average cow, which produces only about 3800 lbs. of milk a year, does not pay. She does not pay for her keep, for the labor involved and for the interest on the investment. The essential point is that a 6,000 or 10,000 lb. cow will eat practically no more than her "boarder" sister—and she will produce dividends. (It is true that the higher producing cows drink a great deal more water than the poor ones, but water is cheap.)

Why then, we may well ask ourselves, should we go on handling cows which barely pay expenses? Why not put our dairy cattle on a profitable basis?

What Is Required to Increase Production?

Obviously good cows are needed. The boarders and scrubs should be sent to the butcher and the proceeds invested in a good bull which will grade up the herd.

Secondly, proper records should be kept to determne which cows are profitable and which are not. Those which fall short of at least 5,000 lbs. of milk a year should be disposed of. A record of this kind need not be elaborate and a few minutes a day are sufficient to enter up the figures.

But over and above these two factors, when we have at least moderately good cows and means of keeping tab on their records—we shall often find that our barns and stables must be rearranged if we are to make the most of the setock we have.

Conditions in the Stable

Only a really healthy cow will produce her best.

If our cows are to be healthy they must have: Plenty of fresh air; plenty of light; the right quantity of the right feed; good fresh water, at the right temperature, before them all the time; cmorfortable quarters and sanitary surroundings.

All these consideration are linked up wth the planning and equipment of our barns and stables.

Ventilation and Light

Plenty of fresh air for the stock necessitates some regular system of ventilation. It is not enough to open a door or a window at intervals and then heremetically seal the stable again. Fresh air should be introduced near the floor level by openings in the wall. Each full grown animal needs about 8 sq. inches of inlet area. The foul air should be taken off by means of a shaft running from the stable, through the mow to an opening in the peak. Each grown animal should be allowed about 15 square inches of outlet area for the foul air. Both inlets and outlets should be provided with dampers so that they can be controlled.

Sunlight is the best disinfectant known to science. Nothing else compares with it and yet it costs nothing. As a germ destroyer it stands supreme. By all means then, let us admit lots of it into our stables. A dark barn is not cosy and is necessarily warm. Cutting out the light of day does not add to the warmth of the stable. A dark barn is awkward to work in, difficult to keep clean, unsanitary and a breeding ground for germs. Let us put plenty of windows in our stables. Allow 4 square feet to each animal. A window 2′ 10″ wide and 4′ 6″ high is a good average size. These may safely be put in with 3′ of wal between them. The bottom of the window should be about 3′ 6″ to4′ 0″ above the stable floor.

Feed and Water

The correct feed for the cow is such a big study in itself that consideration of this point must be left for more detailed treatment. We may say this however: All cows do not eat the same amount. Their needs are different. What makes fat in one animal, produces milk in another and vice versa. It is well, when planning the stable, to make some arrangements for dividing the mangers. If this is done the fast eater cannot rob her neighbor—to their common hurt— and t is possible to arrange individaul rations for the different cows.

The importance of a good water supply for the dairy herd cannot be over estimated. Milk is 87 per cent. water. Seven-eights of the white fluid we call "milk" is just plain water. No cow will give her best if she cannot drink all she wants. It is out of the question to expect her to do this if she is driven out into the cold one or twice a day to gulp down her needs for the twenty-four hours at a semi-frozen creek or trough. The best way of keeping the water before the ciws is that provided by automatic water bowls attached to the stalls and fed from a regulating tank. These save time and disagreeable work and insure a supply of good fresh water at the right temperature, at any hour of the day.

Floors and Stabling

A number of reasons could be given for the growing unpopularity of wood floors and stabling. The increasing cost of lumber is certainly one factor. A growing realization of the superiority of cement and steel from a sanitary, durable and fireproof point of view, is another. Wood floors soak up manure and cannot be properly flushed and cleaned. Wood stabling harbors disease, germs and lice.

Cement floors are easily cleaned and are more durable than wood. Steel stable equipment takes up less room in the stable, allows sunlight and fresh air to circulate freely, never needs patching or repairing and offers no lodging place for germs and lice.

Modern inventions have added greatly to the comfort of the cow. There is no need nowadays to tie the cow with a chain in a dark gloomy stable in such a way that she cannot turn her head, cannot get up or down in comfort, has to stand or lie for hours with her head in one position. It pays to keep the cow in comfort. This has been proved time and again under every possible kind of test. Treat the cow and she will pay big returns in the milk pail.

A good gutter should be built and the cow lined up to it, so that droppings do not fall on the cattle stand. This saves much grooming and helps greatly in producing clean milk with a low bacteria count.

Manure should be cleaned out regularly and dumped at least forty or fifty feet from the stable. A manure pile near the stable, or under it, is nothing but a breeding ground for every kind of disease germ and flies. Even the best cows, fed the most balanced and most suitable rations, will only do their best and pay their biggest profits, when surrounding conditions are favorable. The requirements are simple but are too often overlooked. There is no factory in the world which answers more promptly or more profitably to improved methods of handling than the dairy cow. It is only good business to give her every chance.

Make Sure of Your DE LAVAL Cream Separator Early in 1920

There's no happier or better way of starting the New Year right than by making sure of a new DE LAVAL, if you are either without a cream separator or are using an inferior or half-worn-out machine that should be replaced.

For three years now, thousands of those who wanted a DE LAVAL have had to wait weeks for it and many have had to buy a second grade separator. The demand has simply exceeded the possible supply, though more DE LAVALS have been made each year than ever before.

More and better DE LAVALS will be made this year than ever before—as many as available plant additions and skilled workmen can produce—but the demand gives every indication of being even greater still.

Order your DE LAVAL now. Make sure of getting it. Let it save half its cost by Spring.

See the nearest De Laval local agent at once, or write the nearest De Laval office below for any information desired.

GIVE HORSES STABLE COMFORT

Barns cost like sixty in these days, and a farmer has good reason to think seriously over the economy of the floor area. In planning the buildings there is always the attempt made to accommodate as many animals as possible and cut down the available space to fit a desired number. In the accomplishing of this policy, the comfort and thrift of farm live stock is often violated, and much loss of horse power is the result where space economy is carried to extremes in the horse barn.

The Narrow Bed

Just what an inch or two extra in the width of the average horse stall will add to the comfort of the horse can well be illustrated by a six-foot farmer trying to stretch himself or derive comfort from a bed that is only five feet nine inches long. One night would be sufficient to convince him that bed extension would occupy his thoughts and actions next day. But what of his 16 or 17 hands horse trying to get well-earned rest after a strenuous day in a stall four feet six inches wide. Sixteen hands is five feet four inches. How can any horse lie on his side and stretch in a stall less than that in width?

Nothing will age anyone quicker than lack of rest, or cause stunted growth in young people, and the same holds good with the domestimated animals on the farm. Mature horses age quickly enough anyway from the strain and vicissitudes of work. There is no sense in aging them prematurely by not giving them room to stretch and lie at ease in the periods devoted to rest.

The Detestable Empty Stall

Horse barns are often cursed with an empty stall. There will be four horses on the farm with five stalls in the stable. One stall empty for a whole season, and four horses "cribbed cabined and confined." There is plenty of barn space, but too many stalls. It does not require an extra stall to hold straw forks, feed boxes, discarded harness and all sorts of things usually found in the spare tsall. They occupy the sleeping space of the horse. With movable partitions the space could be arranged to fit the size of the horse and so prevent heavy horses from being confined in pony stalls, where they often are at present, and at the same time expected to come fresh to work in the morning. The heavier the horse the more rest his legs require; pony legs will outwear a draft leg, other things being equal.

Narrow stalls are the cause of the highly harmful fault among horses, that of stall standing. There are not a few farm horses that have acquired the habit of not lying down by being forced to live in a narrow stall; they rest and sleep while standing. There is a legend that horses sleep standing, which is true when they suffer from some disability that makes lying and rising distressful, or when they are exhausted and cannot lie comfortably. But that does not alter the fact that the leg belongs to the horse and must have the best possible treatment, or it will wear out first.

Stall Standing a Harmful Fault

The horse though he has been with man from time immemorial, and has experienced man's domesticating influence for the same period, has yet not shaken off his pristine accomplishments. When in their native haunts they were ever on the watch for their natural enemies, and before they truste dtheir resting place they had it thoroughly examined. It is the same hereditary trait in their character that we see in them when they sniff the pasture for a few paces around them before they bend their knees to lie down, when at liberty on the field. When hitched by the head in a narrow stall this characteristic is checked and they, perforce, elect to stand it out. The two or three years liberty that some farm colts get after leaving their mothers, where they can run or lie as they choose in a yard or loose box, encourages the habit given them by their progenitors, then the sudden change of surroundings which the stall affords has its evil effects on their sensitive natures, and the standing horse is generally the result.

The first step in educating the horse to acquire the habit is the narrow, dark, isolated stall, that is so often assigned to the lonely and newly-weaned colt. It not infrequently happens that colts submitted to this treatment refuse to lie for the first few nights. When tied by the head in cramped quarters, they feel out of touch with their natural desires and what they have been accustomed to with their mothers. For a young horse to strike its head in feeling around in the dark for a suitable place or position, or to lie down too near the manger and have difficulty in rising the first time, would be quite sufficient reasons for it not to make the attempt to lie down again for some time. They are animals of extreme nervous temperament, and have very retentive memories, particularly for disagreeable things.

Stocky Legs and Swollen Joints

Narrow stalls are the adjuncts to stocky legs and deformed joints, and the animal with the listless air. They are doing a world of damage meantime to the horse power on all farms where such a stable arrangement exists, by preventing the horses from obtaining proper rest, and that tells adversely upon the animal's condition and upon its working capacities. The legs suffer very considerable harm when a horse gets into the habit of never lying down, since they are never relieved of the weight of the body, but have to support it during the night time, as well as during the day. Thus they are subjected to an unremitting strain, which tends to wear them out prematurely.

There are some horses that can take partial rest in a narrow stall, but their legs suffer just the same by the cramped position in which they have to lie. Watch the horse at night afield in the summertime when he is dead to the world, and preparing his organism for the efforts of the coming day. He is lying flat on his side with his legs stretched to the full, at rest. The horse does not require a long period of time in which to rest, but he must get the opportunity to get his natural way of taking it. One hour of repose, flat on his side, with outstretched legs is worth three or four hours with his legs tucked up beneath him in a narrow stall where he ventures to snatch some rest by lying down.

The Stable Spring Mattress

There is no end of ingenuity in operation in regard to providing a softbed for the horse owner, spring mattresses and those fitted with the softest material obtainable, and many other arrangements, all fitted to give the greatest ease to the sleeper are provided. The horse generally gets scant consideration in this matter. Damp beds are a fruitful source of illness and death to humanity, and the horse mortality is increased by the same cause. Narrow stalls are generally associated with bad ventilation, and lack of absorbents and damp beds is the result.

On the material to use in stall flooring, there is some discussion among those who take an interest in horse home comforts. A common floor in a horse stall is injurious to the horse and is uncomfortable, and is not conducive to the best sanitation. But if a cement floor is covered with planks it becomes comfortable and can be made sanitary. The stall floor will require to be eight feet from manger to gutter, and on this the cement should be laid with a fall of three inches. At the rear end a sill 2 in. x 4 in. should be laid across the stall but not fixed in the cement. Eight foot planks each eight inches wide, is next laid on, and spiked to the still, the other ends resting on the cement. This will keep bed level and give a runaway for the liquid that will pass through the half inch or more that must be left between the planks. The sill can be cut in the middle and this will make it easier to lift the floor in two pieces for cleaning below, which should be done every three weeks or oftener, if necessary. The floor will require no other support, and will have a springy motion when the horse steps on to it or lies down at night.

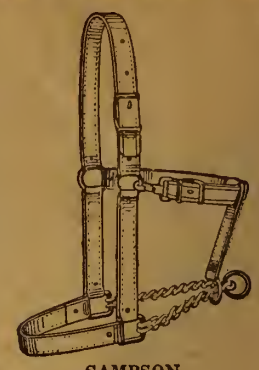
TYPE OF HORSE FITTED TO COMPETE WITH OTHER AGENCIES OF FARM POWER

There are quite a number of agricultural theorists as well as a few practical farmers who believe that horse breeding will no longer be profitable. This growing opinion is due to the popularity of the tractor and the widespread use of the automobile. It is a significant fact that those farmers who advocate the idea that tractors will do away with the draft horse on the farm, are those who have never given the horse power any fair chance to succeed on their farms, and base their comparisons between their own twe-necked broncos and the modern tractor. These are the men that tell you that the horse will not hold his own against the tractor or any other power devised to supplant him. The writer has heard it frequently expressed that on the average farm it does not pay to raise colts. But who wishes to be only an average farmer; he is the one fellow that is hard at the job of keeping down the values of horses, and keeping up the high cost of living in the horse barn, and accordingly the high cost of horse power on the farm. The tractor is credited by such farmers to do motive power on the farm more cheaply and efficiently than horses. Just how far the tractor can do this has not as yet been proven.

Your Horse Can't Break This Halter

We assume the full responsibility by attaching our guarantee tag to this Griffith Sampson Halter. This means that if it breaks within a year from date of purchase we will repair it, or send you a new halter absolutely free of charge.

There's strength in every strap and stitch of the Sampson. See that chain chin draw? That's electric welded steel chain—it grips the horse under the jaw when he pulls and he soon yields to its strength.



SAMPSON

Griffith Guaranteed Halters

Our guarantee tag is attached to all our guaranteed halters. Isn't that a worth while consideration when buying your next halter? Price of Sampson $2.50 (in the West $2.75). If your dealer can't supply you send direct to us giving dealer's name.

Send for free booklet. Shows a halter for every purpose—at a price to suit your purse.

(It has saved hundreds of valuable animals)

On Sale Everywhere. DR. ED. MORIN & CO., Limited, Quebec, Canada. 3

But granting that the big farm finds the tractor an economical power, it cannot be said that horse production can be entirely cut out. It has been explained that heavy plowing in hot weather can be done more cheaply with tractors than with horses, and the truck does hauling so much quicker that the horse must take second place in long and short hauls. But rural Canada has not gotten to the point where roads are always passable for trucks, and there are wet seasons when the tractor cannot be taken to the field.

Cannot Dispose with the Horse

It is not at all probable that the market for big draft animals will ever be overstocked. The city streets are not nearly free from horse-drawn traffic, and the farm must keep a certain number of horses. However, the market for the poor type of draft horse is gone; but the market for big drafters is still good, and bids fair to remain so indefinitely. Horses must be kept on the farm as of old, even though the tractor may be found there also. There are certain farm operations that require horses, and the farmer cannot dispense with the horse entirely, even if he wished to do so. While the number of horses required can be reduced, it is only up to a certain point, for the tractor can encroach in a degree only on the domain of the horse.

A Financial Failure

Of course there is no use for any farmer trying to stay in the draft horse business if he counts his horses as so much expense. If he does not know the value of good breeding, and thinks more of his feed bin than his colts, or is not willing to go to the expense and trouble of having well grown colts at two to three years of age, that are as sound as bullets, he might better go out of business. He is a financial failure, so far as the horse business is concerned, and the breed he represents would be a good deal better without him. This is the class of farmer who never studies the economic use of horse power, or of how horse power can be economically applied, while al lthe time its influence on farm profits is of first importance. Profits in farming are determined by expense involved in production, quite as much as by gross returns. Such profits can be increased only by increasing returns without a corresponding increase in expense, also by decerasing expense without a corresponding decrease in returns. In the work of a farm, the only items of expense which can be very much influenced, are those commonly known as operating costs, and from the standpoint of reducing expense, horse labor costs constitute the item of greatest importance.

Economic Horse Power

The horse that is to meet farm requirements must have weight; the methods of modern farming demand that the unit of horse power must be large. Correct conformation also must combine with weight if the greatest amount of power is to be had from a given weight. He must have the right conformation, if he is to be able not only to walk at a good rate, but also trot when necessary, regardless of whether he weighs 1600 lbs. or a ton. Quality and temperament is also of importance from the standpoint of developing a given amount of horse power per unit of weight. The horse must have these two characteristics if he is to wear and perform his work well.

There is very little known regarding the horse from the standpoint of his efficiency as a motor. To deal intelligently with the problem of economical horse power, whether furnished by machine or by horse, some more information must be gathered regarding the efficiency and lasting power of the various types of motors. The profitable type of horse has been well demonstrated. The horse with the right size, right conformation, quality and temperament, has proved the most economical producer of power as compared with the horse that is not up to the standard required. Thus there are horses and horses. The man who cannot produce a horse which meets the best requirements is playing a losing game. This is as it should be, and the sooner such a farmer finds it out the better it will be for his welfare on the farm.

The profitable horse for the farmer must be of the type that will give an economic source of farm power if he is to meet competition successfully. The future of the horse is in the hands of the farmer, and there is no reason why the horse of the right type should not continue to enjoy the premier place in furnishing power on the farm. In just so far as he falls short of delivering farm power economically, will the horse be displaced by other agencies. It is the farmer who can decide the problem, either by adopting mechanical horse power, or successfully carrying out the business of horse production.

FITTING STALLION FOR SHOW

The showing value to the stallion as an advertising medium should be got by his winning progeny, rather than by himself. Moreover, a stallion that has once demonstrated that he can throw offspring of unusual merit should never be fitted for the show-ring. His offspring should do the winning for him; they become his greatest and best advertisement, and therefore the best prize any stallion can win. Many a good sire, among live stock on the farm, has been sacrificed on the altar of high feeding and fitting for show purposes. The stallion, overfed for breeding, is the one that too often pleases the eye of most judges. Just as he stands before the judge is the limit of the judges' inquiries regarding the animal; his vitality as a stock getter is never questioned, though many horses are spoiled as breeders through feeding, by lack of that very necessary quality.

How Wm. Dunlop Regulates His Horse Breeding

Mr. Dunlop's farm is situated on the wind swept sea shore of the Ayrshire Coast of Scotland. Its pastures slope upward to the sea, and the soil is a sour tough clay exposed to the cold winds that sweeps in from the Atlantic ocean. This condition no doubt explains the ruggedness of the Dunure stock. From his late sale, Mr. Dunlop retained some 40 mares of all ages to serve as a nucleus of even broader Clydesdale operations than he has previously indulged in. The three stallions in his stud are "Dunure Footprint," "Auchenflower," and a big, rugged Sir Hugo stallion of six or seven years, that is used for outcrossing. These three stallions have 550 mares booked for them. "Auchenflower," the sire of "Dunure Ideal," which was the dam of "Dunure Footprint" at 17 years of age, has 100 mares booked. The Sir Hugo horse has another 100 females, while "Footprint" himself has 350. Mares come to Dunure mains from all over Britain, and Ireland, with a few from other lands, two having been sent from Canada. Most of these are sent to "Footprint," but "Auchenflower" draws many.

Between June 1 and June 27 "Footprint's" service per day was nine and one-third mares, and the marvelous feature was the small number of mares not settled at first service. In the month of June only eight mares had been re-bred. This included May and June service. Any horse reared under average show going treatment, that so many stallions get, would not accomplish such a breeding performance as the record of this stallion, or his to companions on the Dunure Farm. It is very unlikely that any breed reared under less rigorous conditions than the Clydesdale could withstand so much service a day.

Leads to Prepotency

The natural conditions under which the stud has all along been kept and selected, has induced prepotency. Not only in quality but in color as well is this distinctive prepotency seen in "Footprint's" progeny. His odd dark roan color with white spot on flank is to be seen in a number of his foals. About half his colts are good bays and browns, and about half are roans.

It is an interesting feature of his prepotency that the most successful of his progeny are of the same dark-bluish roan as himself. The winning mares at the Royal in England this year were of the same shade and markings, the champion "Rosalind" being almost a replica of her sire. It seems that on the average those colts possessing "Footprint's" color inherit more of his good qualities than the colts of less distinctive coloring.

Great sires are scarce and many owners have lost their stallions' usefulness through inattention to the conservation of their breeding qualities. Many a stallion colt is underfed in youth, and overfed when he is required for the show or sale. It is no use thinking that stallion colts can be carried along like stock cattle until prices increase, and then begin feeding to make horses out of them. It cannot be done. It takes feed and care to develop draft stallions, and if a breeder is not willing to go to the expense and trouble of having well-grown colts at twenty-four months of age he would be better to get out of business. He is a financial failure as a horse breeder, and is a class of breeder that will bring reproach to any breed of draft horses. The stallion colt reared in this manner is not saleable, and the owner therefore imagines the horse business has gone to pieces.

The Principles of Feeding

It should never be forgotten that stallions are to be used for breeding purposes, and that the pre-eminent principles of feeding are neither to feed too fast nor to use unsuitable feeds. It is well known that there are "dopes" and ways of feeding that some exhibitors and dealers in horses apply to get horses as quickly fed for show and sale as possible, but stallions so treated are rarely satisfactory breeders, especially for the following one or two seasons. All they need is good feed and water, and the best are oats, bran, clover and alfalfa hay. Oats are pre-eminently the horse's grain feed. A little linseed meal added once a day is beneficial, especially if timothy is the available hay, owing to its low protein content in the feed. A saving of 10 per cent. can be made by grinding or crushing the grain, so as to ensure thorough mastication.

It is essential that stallions should have plenty of good water. It has been proven by experiments that the

PROFIT AND LOSS ON THE POULTRY PLANT

The profit or loss on the poultry plant—more than in any other department on the farm—depends on attention to details.

The poultry keeper who does things in the usual way very often makes a fair profit but it is the poultry keeper who carefully attends to the little things that makes the greatest success.

With the ever increasing cost of production every possible source of revenue should be developed. The high class table egg—infertile—put up in neat packages to command a few cents per dozen over the ordinary new laids; the early hatched chicks to have well matured pullets for winter layers; the early hatched cockerels, other than those reuired for breeding purposes, properly finished and marketed as broilers; the later hatched chicks held for roasters, crate fattened and sold at a time when the market is not glutted; the hens, culled, fattened and sold early in the season at the time of high prices; besides these usual sources of revenue attention should be paid to the eggs for hatching and the day-old chick business. These branches, and particularly the latter, offer great fields for development.

The best of the hens that are not required for next year's breeding may be sold for breeders at a considerable advance over the price that could be obtained for table poultry.

It is by paying special attention to the putting of the product up in an attractive form that the profit is increased. The extra few cents per dozen for the eggs and the increase in price for stock is just so much more profit. In crate feeding not only is the weight being increased, but the quality, as well, so that a higher price per pound may be secured.

A little carelessness at any time of the year may prove disastrous to profits, the incubator lamp is not properly trimmed or the incubator regulator is knocked out of adjustment—Result—a poor hatch. The brooder stove is overlooked some night—Result—a lot of chilled chicks. The poultry house is not disinfected regularly in hot weather—Reusdt—a house infestel with mites—a flock without production. The hens are not culled and half of them are either low or non-producers—Result—the profit produced by the layers used to support the non-layers. There are one hundred and one ways in which the profit may be turned into loss and it is only by constant attention to the aparently little things that success is assured.—Geo. Robertson, Asst. Dominion Poultry Husbandman.

COMBS INDICATE LAYING POWERS

The ornamental appendage known as the comb is one of the chief considerations of the poultry fancier, but it is also an indicator of health and prolificness. Ailing fowls will quickly display a pale-colored and even an almost black-tinted comb whilst an unsightly covering of white spots is sometimes seen. A pleasing contrast is the blood-red comb which adorns the head upon well-ionditioned fowls. Lack of nutriment or anaemia is followed by pale comb and wattles, and is remedied by generous diet and an iron tonic, whilst ventilation or an increased supply of oxygen in the night house will soon improve matters. Disease of the liver or advanced cases of indigestion will alter the comb from red to purple or a dark red color. The cause is generally to be found in overfeeding on starchy food devoid of albuminoids and the omission to compel the birds to exercise. An exclusive corn diet will usually cure the trou-

ble, and it cannot be too widely known that all poultry succeed best when fed in moderation on a spongy or bulky mash once daily. Epsom salts or Glauber salts (which are tasteless) will be of service, also green food (including finely chopped onion) and plenty of sharp flint grit. Empty grit boxes and ill-looking combs are usually closely associated, and unless the hen's gizzard is regularly supplied with grit the liver and digestive organs will quickly be impaired. In some flocks almost from the hatching day the tendency to liver troubles commences, the reason being that the chickens have been fed too soon after hatching with soft food, instead of small flint grit, which should be the first meal of all chickens.

Combs which show signs of scurvy are unsightly, whilst "favus," or white-comb, is very destructive in poultry yards, and, being highly contagious, spreads rapidly. Carbolic ointment will remedy mild cases, but if advanced mercury ointment should be used, made by mixing red oxide of mercury with eight parts lard, and rubbing in well. In all such cases great precaution is necessary, as the favus disease can be transmitted to human beings, especially if the skin or surface is abraded. Frosted combs may be prevented by anointing occasionally in winter weather with vaseline to which a little glycerine and turpentine (one part) has been added. That frosty weather affects not only the combs, but the ovarian organs, is beyond doubt, and for this reason small-combed and rose-combed fowls are usually the better winter layers. During the moult the comb shrinks often to half its normal size, whilst when the new plumage is complete and the fowl's vigor restored the comb increases. Breeders of non-sitting breeds (or those which lay a white-shelled egg) are advised that the combs may be increased in size by giving a daily feed of cooked meat, especially meat meal. This particularly refers to young stock. In such breeds, it may be added, many pin their faith to a hen or pullet with a large, good quality, well drooped comb, firmly set at the base, as indicative of its laying powers; in fact prominent utility poultry-keepers often adopt this plan of selection when making up their pens for producing good layers. In the male bird a well set comb, broad at base, will be found an excellent test of the bird's powers of fertility, for strong, vigorous chickens are seldom bred from pens headed by a male bird with small, dwarfed, thin comb. One of the chief attractions of a poultry show to the aspirant to knowledge is an inspection of the many varied styles of combs seen in the exhibit stages. No matter how some birds may excel in shape and color, if the critical eye of the judge espies a wry, malformed, or unhealthy comb, such specimens are considerably handicapped in the competition.

THE MARITIME POULTRY ASSOCIATION

The organization meeting of the Maritime Poultry Association was held in the Fair Buliding, Amherst, N. S., on December 17th. The last meeting was held in 1916, when the Maritime Poultry Show was held in the city of Moncton. A. F. Houston, president of the Association, presided.

J. A. Clark, Superintendent of the Charlottetown Experimental Station, gave an outline of the work done in the egg laying contest at his Station last year. While White Leghorns predominated in point of numbers in the 1918-19 ocntest, Barred Rock had in the 1919-20 contest. Mr. Clark said he wished to see the plant extended so that there would be room for birds eligible for registration. Prospects, he said, were never brighter than at present for utilitp poultry keepers.

A. C. McCullough, Poultry Supt. for New Brunswick, outlined the progress that is being made in poultry circles in his province. Several New Brunswick poultry keepers had taken part in the Charlottetown egg laying contests. The establishing of boys' and girls' Poutry Clubs and the importation of the best eggs procurable from utility Barred Rocks, on which the Clubs are specializing, is making a marked improvement in the poultry of the Province. Mr. McCullough would not advise parties who do not know the business to go into poultry raising on a large scale. His advice to returned soldiers who purpose embarking in the poultry business is to begin in a small way and increase as knowledge of methods accrue. The speaker's closing remarks dealt with the advisability of standardizing poultry and poultry products for the market.

George Wilson, of the Dominion Poultry Divisioon, who is doing good work in the Porvince of New Brunswick, gave a short talk on several features of the work that is being done. Culling demonstrations have been held with a view to weed out the flocks retaining only the best. At Port Elgin, in the County of Westmorland, the poultry keepers sold their surplus stock co-operatively and realized top notch prices. This is a start in the right direction and while the offering this year was in the vicinity of eght and one-half tons, the success attained by the participants this year augur well for a much larger offering next season.

A. F. Houston outlined the work of the P. E. I. egg circles and the success of the more recent venture in the live and dressed poultry trade.

J. W. P. Clarke, one of the judges, referred to the R. O. P. work in poultry lore and welcomed its introduction as being of inestimable valuue to the future of the poultry business. He explained in detail some of the principal factors which the judge of poultry must consider and the preparation of birds for the show.

Prof. J. P. Landry told about the egg laying contest that is now in progress at Truro, there being 30 pens of 5 birds each. A large number of returned soldiers are taking the poultry course at the N. S. A. C. A Canadian expert on eggs, who inspected a lot of eggs reecntly assembled in Nova Scotia for export, said they were the best lot he had ever seen brought together, a fact which shows that Nova Scotia poultry men are progressing in their work. The eggs, in question were shipped to the English markets, the verdict of the consignees is expected in the course of a few days.

Prof. Landry said the time had arrived when, as a protection to the poultrymen who are placing good products on the markets, that the interprovincial trade in eggs and poultry be standardized.

The connection of the M. P. A. with the Maritime Stock Breeders' Association was also outlined by Mr. Landry.

The election of officers resulted as follows:

President—J. R. McMullen, Truro.

Vice-Presidents—Chas. Johnson, North Sydney; A. F. Houston, Charlottetown, P. E. I.; R. P. Allen, Fredericton, N. B.

Sec.-Treas —A. C. McCullough, Fredericton, N B.

Directors—T. C. Latham, Alma, N. S.; Ed. Jordan, Kentville, N. S.; W. E. B. Tait, Dorchester, N. B.; Vye Gibson, Moncton, N. B.; W. J. Cudmore, Charlottetown, P. E. I.; J. A. Clark, Charlottetown, P. E. I.

Prize List Committee—J. P. Landry, Truro, N. S.; A. C. McCullough and A. F. Houston.

Delegate to Maritime Stock Breeders' Assn.—J. R. McMullen.

Executive Committee—President, Secretary and J. A. Clark.

"WATERS OF MARAH"

"I do believe," said Miss Jessup, looking straight into the other woman's eyes, "that you are the meanest woman in the world."

Mame Pool returned her look evenly. "I shouldn't wonder if I was," she replied. "And I've got a right to be."

"Nobody's got the right to do the things you do," Miss Jessup said, angrily.. "But you keep right on and get your come-uppance."

"Laura Jessup," said Mame Pool calmly, "you can't scare me with your talk about a come-uppance. I've had just about all the come-uppances that's coming to me. When things are just as bad as they can be they can't be worse. And I know it." She walked into the house anr shut the door in Miss Jessup's face with a slam that set the old building chattering. Then she stood with her back against the door. "She called me the meanest woman in the world," she said over and over again to herself. "The meanest woman in the world. She's right, I am."

But somehow—standing there, she did not look mean—only little and poor and piteous. Her clothes were a mere something to conceal the body and lend it warmth. She had worn them for over five years. Yet she had a way of wearing they that warded off ridicule. No one dreamed of offering her new clothes. It was generally understood she had money, but was too stingy to use it.

She knew how she was regarded, but so long as people ignored her she did not mind too much. It was only when they grew bold and sat in audible judgment upon her that she winced. When a few moments before Miss Jessup had overtaken her on the street she had never suspected from greeting how they were going to part.

"For a good while, Mame," Miss Jessup had begun, "I've had it in my mind to speak to you." And then she had spoken.

Miss Jessup had a relentless tongue. She began at the beginning and went through the whole list of Mame Poole's crimes against the community. She would not give to the church or charity so much as one penny. She never baked an ounce for the pastor's aid or the old folks' annual birthday dinner. She never sent a flower or a glass of jelly to the sick. Sne lived unto herself and according to the Bible no one had any right to do that. Moreover, she scattered candal as burdock scatters seeds. She seemed to delight in sking out other people's failings and hanging them on the line of public observation. She was full of bitterness and antagonism toward the whole world. It is true, she was not of much importance to wield a sword, but she used a pin that kept the community smarting. If there was any occasion for her attitude it might be forgiven, but there was none outside herself. It behooved her to mend her ways or take the consequences. "I'm going to say to you what everybody thinks," ended Miss Jessup. "I do believe you're the meanest woman in the world'.'

So at last Mame Pool heard in plain words what her neighbors thought of her. And she had shut the door in Miss Jessup's face. For a few moments she stood defiant and firm, then she collapsed and sank in a crumpled heap on the floor. "My God! My God!" she moaned.

Recovering, she looked around the place. It was hers, having come to her from her mother. Everything was worn, but still the room had the appearance of comfort. Through open doors she could see the other rooms. Women who give to the church and enjoyed society lived in worse places. No wonder people could not understand why she had never a penny for anything beyond her own needs. "And they never shall understand until the day I die. I'm tired of fighting and lying and sneering at other folks good deeds and airing their bad ones to shield myself. I'm the meanest woman in the world, but I'm sick of being mean."

She rose and began to take off her coat. Suddenly she remembered she had a letter she got out of the post office before she met Miss Jessup. Now she opened it and read:

"Dear Minnie:—You have been in my mind a good deal lately. Ever since that preacher got hold of me. He got hard and he won't let go. I don't want him to. I'm sick of bumming round and letting you take care of me. I guess you've seen some hard times trying to keep he going. I want to do something for you now. I've got a job and I'm sending you eight dollars. Use it for yourself.

"HARRY."

Mame Pool read the letter three times before she got its full meaning. As she regarded it her wan eyes filled with tears. Then thee old doubts returned. "It won't last," she said to herself. "He's reformed and got jobs before. I wish I could trust him, but I can't. There's nothing in his past performances to encourage me."

And so Mame Pool went on being the meanest woman in the world. Yet each week she received $8. The money spoke plainer than words, but she was hard to convince. She put it away sacredly. "He'll need it probably," she told herself.

Two or three months passed before she received a second letter.

"Mr. White is keeping hold of me, and besides I'm beginning to keep hold of myself. It pays to be a man. I'm sending you $20 extra. I want you to get some new clothes and come to see me. I want you to know Mr. White. I wish I'd started sooner, so I could be like him. Maybe it isn't too late. You tell me what you think when you come.

"HARRY."

That same day Mame Pool went down town and bought a dark blue suit, with blouse, hat, shoes, and gloves to go with it. The store management was amazed.

"Going to be married?" quizzed Lizzie Moore.

"Watch the Weekly Eagle and find out. That will give you some business of your own to attend. You don't seem to have any too much here," returned Mame.

"Ain't she mean " said the wrathful saleswoman, after Mame had gone out. "I was tempted to tell her so. But from what I hear, Miss Jessup did it good and proper."

Mame Pool was gone before anybody missed her. She was gone so long that people began to think she was never coming back. All winter the house stood coldly keeping the secret. Then spring came, the snows ran away in rills and the lilac bush beside the front door began to put on the airs and graces of new verdure. One morning Miss Jessup loitering by on some errand, saw Mame Pool coming round the corner of the house with very dirty hands. They caught each other's eye and Miss Jessup bowed coldly. But Mame called right out to her. "Oh," Miss Jessup, come here, I want to see you."

Miss Jessup obeyed, because there was a different sound to the woman's voice and a different look to her eyes.

"I'm thinning my jonquils and I want you to have some," Mame said. "I've taken some to Mrs. Pinchbeck and there's thousands left."

"Why, I'm much obliged." In her surprise Miss Jessup scarcely knew what to say.

"And if you're round getting things for the old folks' birthday dinner," Mame continued, "I want to tell you that I'll give you a dollar. I'd bake a cake, too, only I'm a poor hand to bake a cake."

Miss Jessup stared in amazement. "A dollar!" she gasped. "What in the world's happened to you Mame Pool, to make you do a thing like that?"

"I'll tell you, Miss Jessup," Mame answered. "It's Harry."

"My brother Harry. You never knew about him because he went wrong before mother and I ever came here and bought this house. It was on his account we came out of the city. It's cheaper living in the country. And we thought if we had more money to send him maybe he would keep out of scrapes. We never told anybody about him. Then mother died. I had this place and a small income. Harry got the income. Why I lived two days and a half on a pint of beans.' She paused. "Pshaw! What's the use of telling such things? I didn't mind much. But it was hard to be called mean and stingy when—" she paused again. "Of course I could have told you. But after a while I'd been cut to pieces rather than tell. I know I was mean and bitter and wicked. I felt as though God had played a trick on me and I couldn't bear to see other folks happy. For you see Harry was just about all there was in life to me. I was a big girl when he was a baby and I always had to mother him after mother got poorly. But, of Miss Jessup, you ought to see Harry now! He's splendid. He's got a dandy job, and he's straight as can be. I've been with him all winter and he's going to spend his vacation with me—he and his friend, Mr. White. Mr. White's a preacher, and Harry owes everything to him. I'm going to have the house all fixed up. And I've got money to give away. And, best of all, I've got hope and joy and encouragement to live. I'm not going to be the meanest woman in the world any more, Miss Jessup." Her eager voice failed.

Miss Jessup took her two earth-soiled hands in her immaculate white gloved ones. "Mame Pool," she said, "I take that back. I take back everything. And this town is going to do the same ,or Laura Jessup will know the reason why."

WHY GIRLS LEAVE THE FARM

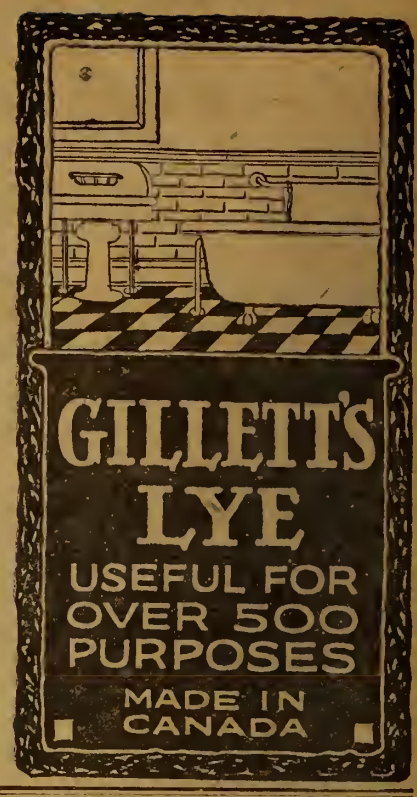
One of the greatest factors in driving girls away from the farm is the desire for economic independence. The majority of the girls of the present age are not found on the farms, but in large cities, where many profitable situations are open to them. But some people may ask, "Why can not the country offer some of the same advantages as the city?" Simply because country people have not become wide enough awake to realize of what value their girls are.

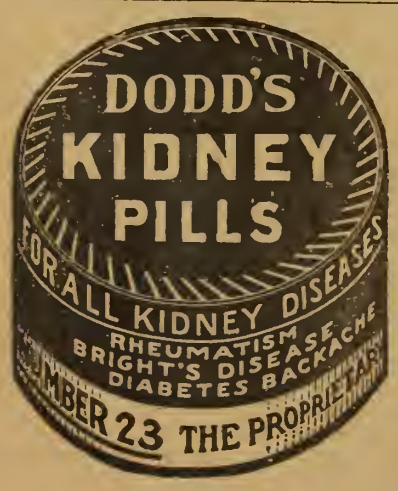
A girl on the farm is not well enough appreciated. When the opportunity of a situation comes, she generally takes it, thinking that she shall be able to earn her own livlihood and be independent of others. Many country girls (please note that there are exceptions to all rules) are expected to help with the house work and the barn and field work also. And by doing both she has no time for the little trifles so dear to the heart of the girl. If the country girl had not so much work to do she would be far more willing to stay on the farm.

All girls, I believe, like house work but not work which will tend to destroy their robust appearance. Why do country mothers not try and introduce new methods and ideas into their homes, instead of letting their daughters go to the large cities to find them? Why not give our girls more time to read and observe those things which help to beautify and make the home more home-like and less like a work shop where everything is done in the same way over and over again, and where there is only work. Bring into the home books which have the very newest and best ideas inside their covers.

Let the country girl take a vacation, the same as the city girl. When she returns we will find she is more willing to help with the work, also she brings many new suggestions, which will be most useful in the home if carried out.

Why not give the girls something on the farm which is their own and





Heart Pains So Bad

SAT UP MANY NIGHTS.

A large majority of the people are troubled more or less, with some form of heart trouble, and that distressed feeling that comes to those whose heart is in a weakened condition causes great anxiety and alarm.

On the first sign of any weakness of the heart Milburn's Heart and Nerve Pills should be taken, and thus secure prompt and permanent relief.

Mrs. Thomas Hopkins, Crowell, N.S., writes:—"I had heart trouble for several years, sometimes better and sometimes worse, but a year ago last fall I could not lie down in bed for that distressed feeling, and had to get up and sit up a great many nights, and when I did lie down it was with my head very high. I purchased two boxes of Milburn's Heart and Nerve Pills and feel a lot better. I can now lie down quite comfortably and the pains have gone too."

Milburn's Heart and Nerve Pills are 50c. a box at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

out of which they can make a little "pin money?" For example, there is often a motherless little pig or lamb. Give it to the girls and they will make money out of it, if money can be made.

Would it not be more profitable to get the girl in the country home a piano and other articles which she wants, such as nice clothes, rather than to let her go away from home? The farmer would have to hire some one to do the work she once did. The work would not be so well done, nor would the mother enjoy working as well with a stranger as with her own daughter.

Let us give our girls the joy of social life by bringing good company to our homes. Let us not keep our parlor as a store room in which to keep our laec curtains, oak rockers, and plush carpets, but have it for a living room. There are no parlors nowadays. The very name signifies that it is a place in which you must not touch or handle anything. Who could enjoy themselves in such a place? Keep the living room attractive and let in plenty of sunshine and air; have it ready to receive our friends and our own folks. Don't worry about keeping a grand room, into which we may look once in a while to see if the moths are eating the carpet.

A Driving Horse Essential

If the farmer would keep a good horse that the daughter might drive he would soon see how much good it would do. There are many times when the "women folk" wish to go some place, and often the men are "too busy" to take them, and the women are deprived of their outing. But let us not make the mistake of thinking that the farm girl will be satisfied with some old mule of a horse that the men would not drive. Give the girl a good spirited horse. Let her drive it to suit herself. She will soon have it so anyone can drive it. The harness and the buggy should be such that the driver will take an interest in them and keep them in good order.

We country mothers should see that our daughters get a good public school education also a couple of years at high school if possible. Then when the girls are out in good society, they are not at a loss to know what to talk about. At school they would meet with other boys and girls and would be able to study their characters and deportment. This would help them to classify their acquaintances in after life.

PILES Do not suffer another day with Itching, Bleeding, or Protruding Piles. No surgical operation required. Dr. Chase's Ointment will relieve you at once and as certainly cure you. 60c. a box; all dealers, or Edmanson, Bates & Co., Limited, Toronto. Sample box free if you mention this paper and enclose 2c. stamp to pay postage.

MAKING EVEN STEWS INTERESTING

When they had settled with the chauffer which way they had wanted to go, Mrs. Nixon leaned back in the seat and said, "Won't you tell me, Jennie Duncannon, how you make your family eat stews and things? I can't mine. John is always complaining these days, because I spend too much on the table, then neither he nor the children will eat anything but chicken, beefsteak and charlotte russe."

"I'll tell you what the secret is," replied Mrs. Duncannon. "You probably do what so many people do when they are serving cheap dishes, you fail to make them interesting. I know that you always garnish your steak with parsley and lemon cups; I have sen you take fifteen minutes to make cranberry strings for a turkey; and you always put candied cherries on your charlte russe. But do you ever bother that way with your stews and bread puddings?"

"Why, no, I don't supose I do. I never thought——"

"No, you never thought they were worth the trouble. Well that is my secret. I save my cherries and nuts for my bread and rice puddings. I always serve my bread pudding in my rock crystal sherbet cups instead of the dish in which it was baked, with a bit of whiped cream and a cherry on top. I put a row of tiny brown buttered biscuits around my lamb stew, eactly as if it was fricasseed chicken. I serve my nourishing soups in bullion-cups with golden brown croutons. I cream the left-over vegetables in china ramekins and often put a flower or a leaf on the saucer. I can put a brown stew with vegetables on the table that will look every bit as inviting as a planked steak and will taste as good. I have attractive little molds for my corn-starch puddings. I bake the simple one-egg cakes and gingerbreads in fancy pans. I try all the new dishes I find in my magazines so things won't get monotonous.

"Try baking your rice pudding some day in little individual custard cups, and sprinkle a few chopped nuts over each. Bake your cottage pudding in a Turk's head and fill the centre with the sauce and serve it on your pretties plate. Put a few almonds in your stewed apricots and serve them ice cold in glass dishes with ginger cakes and they won't say, "Oh, dear, there's that old stewed fruit again.' There are many things that you will think of yourself that will make your work more interesting. And, most important of all, you will both economize and delight all the family."—By Jane Gates.

A THRIFTY MISTRESS IN THE FARM HOME

Some people seem to think that saving money consists entirely in stopping expenses. But that is purely hoarding. Of course, the first step in saving is to cut out the foolish expenses, and one must have the common sense to discriminate between the foolish and wise expenditures.

The big thing is to know how to spend. The thrifty man knows how to spend as well as how to accumulate. He gets full value for his money and looks ahead. He may not take his family to the theatre often, but he sees that they have good books and music of sime kind at home. His wife and daughters may not set the fashion in their neighborhood, but no matter how successful the earner may be, it is too often the case that the spender gets rid of the money as fast or faster than it comes in.

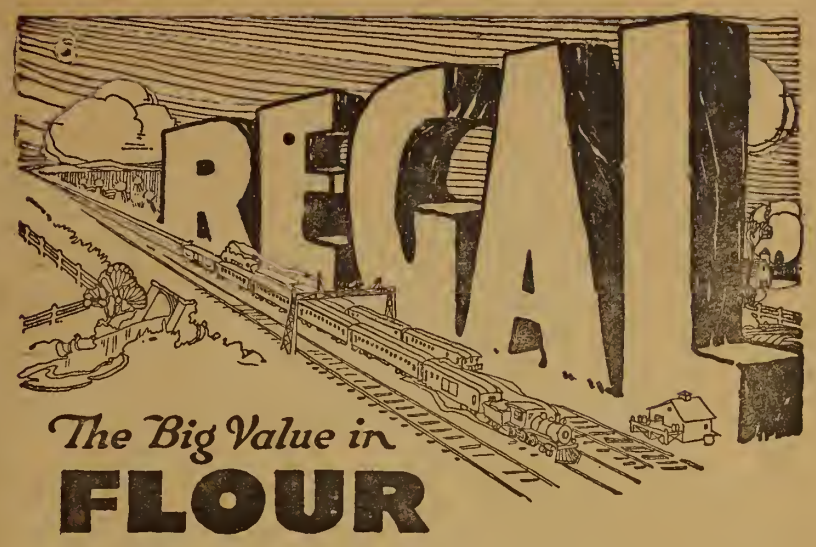
On the other hand, the successful mistress of the home fights half the battle and in some cases more than half. Once a woman gets the idea of saving, order and system into her work, she can beat a man at it in most cases. Women are usually more persistent savers than are men, and they are more apt to watch the small leaks.

The farmer's success or failure, his going up or his going down in his scale of accomplishments, depends upon his wife. A helpful, thrifty wife, one who is conserving her husband's capital, his health, his earning ability, not to mention his pocketbook, closes the avenue of waste and will make him succeed, while with a wasteful and careless wife, a man might as well give up success.

The housewife must feel the dignity and importance of her calling and should put as much energy into her job as her husband puts into his job. To be a sucecssful homemaker requires study, just as it does to become a successful teacher or lawyer. The pity of it that too many girls become homemakers with little or no preparation.

PEANUT COOKIES

Six tablespoonfuls fat, one-fourth cupful peanut butter, one cupful molasses, one-fourth cupful sour milk, one-half teaspoonful soda, one teaspoonful baking powder, three and one-half cupfuls rye flour or war flour, or enough to make a stiff dough. Mix in the order given. Bake in moderate oven.



The Big Value in
FLOUR

THE care exercised in selecting the wheat used in the making of "REGAL FLOUR" is one of the many efforts which has helped to secure for "REGAL" the reputation—big value in flour.

I KNOW A WOMAN'S SUFFERINGS

I am a woman.

What I have suffered is a far better guide than any MAN'S experience gained second-hand.

I know your need for sympathy and health.

And the treatment that gave me health and strength, new interest in life, I want to pass on to you, that you, too, may enjoy the priceless boon of health.

Are you unhappy, unfit for your duties? Write and tell me how you feel and I will send you ten days' FREE trial of a home treatment to meet your individual needs, together with references to women in Canada who have passed through your troubles and regained health; or you can secure this FREE treatment for your daughter, sister or mother.

If you suffer from pain in the head, back, or bowels, feeling of weight and dragging down sensations, falling or displacement of internal organs, bladder irritation with frequent urination, obstinate constipation or piles, pain in the sides regularly or irregularly, bloating, dyspepsia, extreme nervousness, depressed spirits, melancholy, desire to cry, fear of something evil about to happen, creeping feeling up the spine, palpitation, hot flashes, weariness, sallow complexion, with dark circles under the eyes, pain in the left breast or a general feeling that life is not worth living, I invite you to send to-day for my complete ten days' treatment entirely free and postpaid, to prove to yourself that these ailments can be easily and surely overcome at your own home, without the expense of hospital treatment, or the dangers of an operation. Women everywhere are escaping the surgeon's knife by knowing of my simple method of home treatment, and when you have been benefited, my sister, I shall only ask you to pass the good word along to some other sufferer. My home treatment is for all,—young or old.

Read My FREE Offer:

To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually dispels green-sickness (chlorosis), irregularities, headaches and lassitude in young women, and restores them to plumpness and health. Tell me if you are worried about your daughter. Remember it costs you nothing to give my method of home treatment a complete ten days' trial, and if you wish to continue, it costs only a few cents a week to do so, and it does not interfere with one's daily work. Is health worth asking for? Write for the free treatment suited to your needs, and I will send it in plain wrapper by return mail. Cut out this offer, mark the places that tell your feelings, and return to me. Write and ask for the free treatment to-day, as you may not see this offer again. Address:

MRS. M. SUMMERS, Box 309 Windsor, Ontario

Had Severe Cold

IT TURNED TO

BRONCHITIS.

Many people have bronchitis and don't know it.

Don't even know the danger of neglecting it.

Bronchitis starts with a dry, short, painful, hacking cough, accompanied with rapid wheezing, and a feeling of oppression or tightness through the chest.

At first the raised-up phlegm is of a light color, but as the trouble progresses it becomes of a yellowish or greenish color, and is very often of a sliny nature, streaked with blood.

Bronchitis should never be neglected. Pneumonia or Consumption may follow if it is.

Mr. E. E. Boyce, Edmonton, Alta., writes:—"Last winter I took a severe cold which turned to bronchitis. The doctor I had could not seem to relieve it, and I had been treated by him for eight weeks. Then, a friend came in and recommended me to try Dr. Wood's Norway Pine Syrup. After taking one bottle I was greatly relieved. I got two more bottles, and can say it has quite cured me. It has stopped my cough and my spitting up lots of phlegm. Have not had an attack since. I can assure you I would not be without a bottle of it in the house. It has helped my children also. I think it is a wonderful remedy for coughs or bronchitis."

Dr. Wood's Norway Pine Syrup is put up in a yellow wrapper; 3 pine trees the trade mark; price 25c. and 50c.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

THAT SHANK

By Lillian E. Andrews

Many women think of a shank only in connection with soup-making, but I have come to look upon it as the most desirable cut in the butcher's shop. I always buy the largest shank I can afford, trying, if possible, to get the upper cut of the fore leg. This is round and thick-meated, and the bone is filled with marrow, making very little waste.

I put it into cold water and gradually allow it to come to a boil, the long, slow cooking rendering it as soft and tender as the higher-priced cuts. When it is donel table out most of the meat and part of the stock which is set aside in a bowl separately from the meat.

Soup

To make the soup, add to the stock in the kettle, ground or dried sage and Summer savory (the sage may be omitted if the flavor is not liked), a small red pepper, chopped fine, or a very little cayenne pepper, salt to taste, one or two carrots and a turnip (a round turnip is better than the ordinary French turnip), and as many potatoes as the family can use in one or two meals.

If onions are liked, slice in one large o rtwo small ones. Thicken with rice or rice-flour. If the ordinary Summer savory is not at hand use a teaspoonful of poultry-seasoning. Any seasoned stock left from the soup should be saved.

Beef Fricassee

When the soup is gone, cut slices from the cold meat and put in a small saucepan, covering with about a cup and a half of water. Fry a few slices of an onion and add to the meat. Season with salt and pepper and, just before serving, thicken with a teaspoonful of corn-starch, dissolved in a little cold water. Serve with a double portion of boiled optatoes .

Meat Balls

The meat portion of another meal is made by chopping or grinding some of the shank until fine, and mixing with one or two well-beaten eggs. Season with a little poultry-seasoning and mold with the hands into tiny balls. Turn in a well-greased frying-pan until heated through thoroughly, and serve with a sprig of parsley on each ball. These little meat balls have been enthusiastically praised by visitors who had no idea they were eating fifteen-cents-a-pound shank.

Meat Pie

Cut some of the meat fine or in slices as desired, and put in a kettle with the unseasoned stock. Thin with hot water and add a sliced onion and sliced potatoes, either raw or leftovers from some other meal. As soon as thoroughly heated, or as soon as the potatoes are soft, pour into a deep pan. Add a handful of oatmeal or a teaspoonful of flour or corn-starch, cover with well-shortened pie-crust, and bake in a hot oven until brown.

If any of the meat remains at the end of the week, it goes into mince meat for pies or turnovers. The bone is burned until white and brittle, when I pound it up and my chickens greedily devour it.

Literally there is nothing left of the shank but satisfaction at the memory of so many good and inexpensive meals. Let any woman who has hitherto looked askance at the ungainly, awkward cut of meat, known as shank, try using it for something beside soup and become convinced of its adaptability.

LIGHT DIET

Beef Tea

1 lb. thin beef, 1 pt. cold water, ½ teaspoonful salt.

Cut the meat very fine and put into the cold salted water. Let stand 1 to 2 hours. Put in double boiler and cook 30 minutes. Press through a strainer. If too fat, remove with paper. This is very strong beef tea and may have more water added if needed.

Chicken Broth

Clean, skin and cut up the chicken, remove the fat; cover with cold water, adding a tablespoonful of salt and a little pepper. Simmer for three or four hours until the chicken is tender. Strain. Rice may be cooked with it, if desired.

Mutton Broth

Two pounds of lean mutton, without fat or skin, boiled in 3 pints of cold water, heated slowly for two hours; then add one teaspoonful salt and a little pepper. When meat is in shreds, strain and when cool remove the fat.

RELIEF AT LAST

I want to help you if you are suffering from bleeding, itching, blind or protruding Piles. I can tell you how, in your own home and without anyone's assistance, you can apply the best of all treatments.

PILES TREATED AT HOME

I promise to send you a FREE trial of the new absorption treatment, and references from your own locality if you will but write and ask. I assure you of immediate relief. Send no money, but tell others of this offer.

CHARLES FAWCETT LIMITED
SACKVILLE · N · B · CANADA

Good Soup Stock

One quart of water to each pound of sound steak, cut fine, (bone but no fat). Boil slowly 8 to 10 hours. Skim when cold. Add salt and pepper when heating.

Oyster Stew

1 qt. Oysters, 1 tbsp. Butter, 1 pt. Milk, Pepper and salt to taste.

Smaller quantity made in proportion.

Put oysters in pan, simmer until plump and edges curl. Bring milk to a boil in another pan. Place butter, salt and pepper in bottom of dish in which you are going to serve. Put milk and oysters together and pour over these. Serve very hot.

Oatmeal Gruel

1 cup Oatmeal, 1 quart water, ½ teaspoonful salt.

Put oatmeal in a quart of cold salt-Strain, pressing through sieve. Simmer liquid in double boiler three-quarters of an hour. Thin with milk or cream, as you use.

Indian Meal Gruel

Mix a tablespoonful of flour, two tablespoons corn meal and a teaspoon of salt together. Make into a thin paste with cold water. Put into one quart of boiling water. Boil in double boiler for 1 hour. Thin with milk or cream.

Stewed Prunes

Wash carefully and if hard and dry soak one hour before cooking. Put in a pan and cover with boiling water. Simmer, closely covered until swollen and tender. Add 1 tablespoon of sugar for one quart of prunes. Cook five minutes longer and set away to cool.

MONCTON HALIFAX ST. JOHN

Egg Nog (No. 1)

Beat one egg well, add one tablespoon of sugar, 1 teaspoon vanilla, (or tablespoon of whiskey or brandy if ordered). Fill tumbler with milk and grate a little nutmeg over the top.

Egg Nog (No. 2)

Stir yolk of egg, milk and sugar together, with flavoring. Then beat white to light froth and stir into mixture.

Custard

1 cup milk, 1 tbsp. sugar, 1 egg, little vanilla, nutmeg.

Beat egg well, add to milk, sugar, and flavoring. Grate little nutmeg over top. Bake in moderate oven until firm.

Milk Toast

Toast bread to an even brown, pare edges, butter. Pour over it hot but not boiling milk.

Egg on Toast

Have a shallow pan nearly full of salted and boiling water. Break eggs carefully into water. Dip water over them with spoon and when a film has former on yolk and white is firm, take up with skimmer and place on toast.

Soft Boiled Egg

Put eggs in sauce pan, cover with boiling water and let stand six to ten minutes, where the water will keep hot, but not boiling. The white will be soft and jelly like and the yolk soft but not liquid.

Hard Boiled Eggs

Cook them twenty minutes in water just bubbling. The yolk of an egg cooked ten minutes in rapidly boiling water is tough and indigestible; cooked twenty minutes it is dry, mealy and easily digested.

Baked Apples

1 teaspoon sugar. 1 tablespoon water to each apple. Wipe apples, remove the core, put them in granite or earthen dish. Put sugar in centre of each apple and water in dish. Bake in hot oven from 20 to 30 minutes until soft, but not broken.

Steamed Apples

Wipe, core and pare the apples. Place in a steamer and cook until soft. Very nice with cream.

Other Articles used for Light Diet are:

Baked potatoes, Cereals. Beek steak Tapioca. Tea, cocoa, coffee, Jellies.

Tea should never be boiled. We pour boiling water on tea to draw out the flavor. Steep, not boil for five minutes. Have water freshly boiled.

Coffee is stimulating. Use 1 teaspoonful of coffee to each cup of boiling water. Place coffee grounds, clean egg shell, with enough cold water to cover in coffee pot. Let stand almost ten minutes. Now add proper amount of boiling water and let simmer (not boil) for twenty minutes. (Very good).

Arranged by Laura J. Winter.

Surprise Rolls

1 cup cooked chopped meat.
½ teaspoon salt.
3 teaspoons baking powder.
Milk to moisten dough.
¾ cup white sauce or tomato sauce.
3 cups flour.
¼ cup shortening.

Rub the fat into the flour, the baking powder, and salt . Mix into a soft dough with milk. Roll fairly thin and cut into rounds. Season the meat and mix with white sauce. Put a little onto one-half of each round, fold over the other half, press the edges together and bake for thirty minutes. Serves four.

Miss M. G. M., Manitoba.

Crumbed Chops

1 pound lean pork or veal chops.
1 egg.
1 cup fine bread crumbs.
Flour.
Salt.

Dredge chops in flour, dip in beaten egg, which has been diluted with one tablespoon water. Cover both sides of chops with crumbs and fry slowly in small amount of fat until well browned. Serves five.

Mrs. Z. P., Wisconsin.

Lemon Meringue Pie

2 tablespoons corn starch.
Pinch of salt.
1 cup boiling water.
¾ cup sugar.
1 lemon (juice and rind.)
3 tablespoons sugar.
3 eggs.

Put the corn starch, sugar and salt in a bowl and add the grated rind of half a lemon and add the juice of a whole one. Add the egg yolks well beaten. Pour on boiling water and cook until it thickens, stirring all the time to prevent lumping. Pour into baked crust and add meringue made of the whites of the eggs beaten stiff and sugar added and brown in a cool oven.

Teacher—Don't you know that punctuation means that you must pause?

Willie—'Course I do. An auto driver punctuated his tire in front of our house Sunday and he paused for half an hour.

Bigger Business From Better Health

"WHAT is this notion you have about the health of employes?"

"It is no notion, but a great big idea that I got when on military duty. It is one of the biggest benefits that is going to result from the war.

"Well?"

"What set me thinking was the report of the draft board. Forty per cent. of the men examined were turned down as medically unfit. These men were from all classes, and since they were mostly young men it stands to reason that a far larger proportion of our men would be in the 'unfit' class."

"We cannot help that."

"That is just it. We must help it if we are going to build bigger business and get the production we are after. What is the use of spending hundreds of thousands of dollars on the extension of buildings and then fill them with men who are not in a condition of health to do a day's work?

"That is true. What was wrong with most of those culled out?"

"Twenty-five per cent. were incapacitated because of nervous disorders. Malnutrition, the doctors said, was the cause of their condition. That way from childhood, perhaps. Their blood was thin and watery and their nervous system starved. As a result they were easily tired and had no reserve force. They would catch cold easily and in fact be easy prey to any germ disease.

"What can we do?

"We can see that they get half a day a week for outdoor recreation, and I am going to recommend the use of Dr. Chase's Nerve Food to these men. You know what the Nerve Food did for me when my nerves gave out. If I have my way it is going to have a good try-out among the men, for there is nothing I know of that will build them up so well."

"You certainly should know after the condition you were in, for I sometimes thought you would never get around."

"There are other ways we can help the men by better working conditions, but these are included in these building plans."

"Bigger business from better health" is my motto, and I know Dr. Chase's Nerve Food is going to help me carry out this program."

Dr. Chase's Nerve Food is so universally used that you can obtain it from any dealer at 50 cents a box, 6 for $2.75, or from Edmanson, Bates & Co., Limited, Toronto. The portrait and signature of A. W. Chase, M.D., the famous Receipt Book author, are on every box of the genuine.

NEW DRUG COMPANY IN ST. JOHN

PUTS "LIVE-RITE REMEDIES" ON MARKET—ALREADY HUGE SUCCESS FOR DIFFERENT AILMENTS.

Much interest will be aroused in the announcement of the formation of a new drug company in St. John, the "Maritime Drug Co." with offices at 108 Prince William street, where they have now opened for business. They have placed on the market their products known as "Live-rite Remedies" which have been specially prepared for them by a skilful chemist from carefully and well tried formulae. Prior to these remedies being offered for sale to the public they have been tested in genuine cases of illness, for various disorders of the internal organs, the liver and stomach particularly, and have been found of incalcuable value, invariably making a complete cure.

Reliable druggists throughout the province have been supplied with the company's "Live-rite Tonic," which is especially recommended to sufferers from liver and stomach trouble, but should it not be possible to secure this preparation from their druggist, an order enclosing the purchase price of one dollar sent to the company's office, 108 Prince William street, will cause it to be sent immediately to the address mentioned. It is a new blood food, a laxative, a body strengthener, which will work wonders in a run-down system—try it and be convinced.

Other "Live-rite Remedies" will soon be offered for sale, and will ensure relief to many who hav long been ailing. Ask your dealer for "Live-rite goods."

SHALL WE PUNISH OUR CHILDREN?

There are no little girls or little boys either, who do no need to be punished at times.

Some very learned folks say that this is the fault of the grown-ups, because children are born without habits and only acquire bad ones because of the bad influence of our training. Maybe that is so. We hope it is, because there may come a time when we will know enough about training of children to avoid bad habits altogether.

But that is not of much comfort to us now; for the fact remains that at the present time all children—even yours and mine—need to be punished. Moreover, the punishment that will make one child repent a wrong act will have absolutely no effect upon another who has been naughty in the same way.

Yet there is hope. For generations wise people have been trying to find the solution and today some are sure that they have it. They admit that their system is not always successful, but they say that it is a good general rule.

It is: Never to punish children at all, but to let them "take the consequences."

Here is an example of the way their system works:

The children of a cetrain family say that breakfast in their house is as good as a party. It is not what would be called a dignified meal tobe sure. There are guessing games with father and story telling, and there have even been songs.

Just Punishment is Proper.

But sometimes the children waken too early in the morning and begin to romp and make a noise and sometimes to quarrel when father and mother want to sleep a little longer. And then the children take the consequesnces.

For, of course, if father has had to listen to those loud little voices for hours before breakfast, he is tired, and needs a rest before his busy day begins. o the children sit through breakfast in silence, while father and mother discuss things quite over their heads.

Try something like that on the children you know and see if they do not say, as the little girle in this family did, "Consequences is the worst punishment I ever had."

A child seems to feel, almost instinctively, that the "consequences" are his own doing, and not—like a punishment— something that an older unkind, misunderstanding person does to him. That is what makes "taking the conseqeunces" so much more effective than any other form of punishment.

Take for example an instance that is familiar to all of us who have anything to do with children.

The Little Boy on the next block is a jolly, healthy, companable little fellow, but not particularly well brought up. So when the Little Girl comes out to the sand box and spoils the castle he is building, the Little Boy stamps his foot and clenches his fist and shouts "devil" at her.

At once the Little Boy's Nurse, who does not know about "taking the consequenes" jumps up and shakes the Little Boy and tells him he is very wicked and "he'll see what he'll get."

"I don't care if they do spank me," says the Little Boy defiantly, "It doesn't hurt—much. And anyway she is a devil."

For a moment the little girl wonders what this is all about. She has never before heard the word which created the trouble and she does not know what it means. But it sounds very strong and attractive, so the little girl puts the word away in her mind to use the next time she wishes to express disapproval.

She finds the occasion that very afternoon when her brother takes one of her toys.

"Devil!" she shouts, and snatches it away.

"Mary," says her mother, "What was that word you used just now?"

"Devil," says Mary, "Johnny Jones called me one."

"Never let me hear you say that again, Mary. A devil is a very wicked person, and when you call your little brother that. you are just as unkind to him as if you hit him. And little girls who are unkind to their little brothers cannot be trusted to play with them, or with anybody else. Remember that."

Teach children to reason.

But suppose Mary forgets her mother's warning and says the wicked word again?

"I can't trust you not to be unkind to your little friends," says Mary's mother, "and so you will have to take the consequences. You can't go to the party today."

Do you think Mary is apt to try the experiment again? No, indeed, for a child learns quickly by experience.

We all want pretty much the same thing for our children in the end. We want them to be healthy, honest, loyal and generous. We want them to have enough respect for authority to keep them obedient to the laws of the land and true to their faith. We want them to have enough strength of mind and independence of spirit to make them battle for what they know to be right. So we must give them all the experience they need to achieve this.

Now they will never gain this experience without "taking the consequences" each and every time for their acts, good or evil. It is the wise parent who understands this, who knows just when to shield a child from life's buffets and when to let him meet an experience unaided.

BUSINESS HINTS FOR WOMEN

This paper was written by Mrs. William W. Fawcett and read by her at a meeting of the Upper Sackville branch of the New Brunswick Women's Institute.

I think you will all agre with me, that this is rather a difficult question for a woman to write about. Though woman's mind and intellect are supposed to be inferior to man, yet she has been found in nearly all business offices of trade and commerce and in many professional lines, doing her tasks well. She is found at the bar conducting heavy cases. She has been found to be superior in the detective line. She has made good progress in the medical world, and in fact in what ever line her energies have been devoted she has taken no second place. As a rule, however, the average woman is not well acquainted with business methods of today and perhaps no line is so little understood and feared as affairs of the Bank. I have therefore gathered some information, chiefly along the line of banking.

Though banking cannot have been much required and in all likelihood did not arise till society had made considerable advances, yet its origin goes back to a remote period of antiquity. The practice of taking interest for money, called banking, is alluded to in the Mosiac law in Exodis and other places in the Old Testament, also in the New Testament. A highly interesting discovery has recently been made that there was a banking establishment in ancient Babaylon founded by a man called "Egibe," which lasted at least from the first year of Nebuchadnezzar 11 B. C., 604, to the end of the reign of Darius, 485 B. C., and conducted financial operations of a magnitude which would have done no discredit to the Bank of England.

Banking has been going on ever since, always widening the scope of its operations until at the present time conditions make it exceedingly inconvenient to do business without being in reach of a aBnk. This is largely so for two reasons—firstly, owing to the liability of loss of money from fire, thieves or accidental loss. All classes of persons deposit their money in Banks for safe keeping and when paying a bill issue a written order or cheque, directing the Bank to pay Mr. B. or his order, or bearer, so much cash; secondly, present day conditions demand that spot cash or its equivalent be paid the seller whenever a purchase or deal is made. A great many persons depend almost entirely upon the aBnks to supply them with the money. The Banks do this upon the written promise of the borrower to pay the money back upon a certain date, never exceeding four months with interest and bank charges.

People whose credit is not good cannot get this accommodation and, the Bank seldom loans money on notes unles two responsible parties agree to pay the amount. Thus we have an immense amount of business done through the bank, which is known as discounting. That is to say, the bank furnishes the money for a short time and charges 6 to 12 per cent. interest for the accommodation.

aBnks are very large borrowers of money themselves, for which they do not pay more than 3½ per cent. They therefore make very large profits in turning it over several times a year at the high rates I have just mentioned.

A cheque may be made payable to a specified person, or to their order, or to the bearer. In case it is made payable to the order of the person, the Bank will not pay it unless the name is written on the back, which is endorsing it, unless the person is a stranger to the teller, and in that case the teller wants to know if it is his signature and has him sign it in his presence. As a rule, in case of strangers, the teller will not cash a cheque unless the stranger is identified. If made payable to bearer or specified person, it does not have to be endorsed, but a teller will often ask to have it done as evidence of who gets the money.

It is often the case that a woman is sent to the bank to pay a note that is due. She would say to the teller, "I wish to pay a note for $100.00 due today in favor of Mr. I. made by Mr. C. Have you it there?" If he holds the note there is nothing for her to do but pay the money and take the note. In case she has not money enough to pay the full amount of the note she will ask the teller to endorse the amount on the back of the note with the date and the name of the person who paid it. That shows that so much has been paid by whom and when. If a note is not all paid the day it becomes due, it then becomes dishonored.

If the person's credit is good, notes can usually be renewed for part of the amount and sometimes the whole. If this cannot be done, the bank without delay will take steps to collect the balance and it is usually useless for the party thus dishonoring their note to try to affect another loan from the same bank. Bankers keep a very sharp eye on all transactions of this kind and the different patrons of the bank are classified as good, fair and no good. Bank managers are required to send a daily statement of the name

Can't Say Enough in Their Favor

Why Mrs. F. Lagacey Recommends Dodd's Dyspepsia Tablets to all her friends who have Stomach Troubles.

"I cannot say enough in favor of Dodd's Dyspepsia Tablets," so says Mrs. Augustine F. Lagacey, Green Point, N.B. Of couruse she has reasons for making a statement like this, and here they are:

"When I commenced to take Dodd's Dyspepsia Tablets my food would not digest properly. They made me well."

The moral of this is that if you take your stomach trouble before it gets too firm a grip it is easily helped by Dodd's Dyspepsia Tablets.

But as in Mrs. Lagacey's case, stomach trouble, if neglected, always grows worse. In its worst stages it takes time to help it. But Dodd's Dyspepsia Tablets will do it.

Dodd's Dyspepsia Tablets, 50c a box, or six boxes for $2.50, at all dealers, or The Dodds Medicine Co., Limited, Toronto, Ont.

A MESSAGE TO WOMEN!!

LET a woman ease your suffering. I want you to write, and let me tell you of my simple method of home treatment, send you ten days' free trial, postpaid. and put you in touch with women in Canada who will gladly tell what my method has done for them.

If you are troubled with weak, tired feelings, headache, backache, bearing down sensations, bladder weakness, constipation, catarrhal conditions, pain in the sides, regularly or irregularly, bloating, sense of falling or misplacement of internal organs, nervousness, desire to cry, palpitation, hot flashes, dark rings under the eyes, or a loss of interest in life, write to me today for free trial treatment.

Mrs. M. Summers, Box 309 Windsor, Ont.

and amount of every note which that day has been dishonored or renewed. In that way managers and general managers become thoroughly acquainted with persons whom they care to do business with. It is, therefore, plain to see that it is very necessary for a firm or individual who wishes to loan money from the bank to keep their credit good.

To endorse cheque or note properly, write your name across the back of it, about 1½ inches from the top on what would be the left hand end of the cheque or note as it lies with its face towards you. If you endorse a note, you thereby agree to the payment of the amount mentioned in the note, but when you endorse a cheque you simply give evidence that you have received the amount of money mentioned in the cheque..

If you wish to make a deposit of money on acount in a bank it is necessary to make out an application. The forms are found on the desk for the use of bank patrons, stating the amount and the denomination of the bills, how many $5.00, how many $10.00, etc., and the total amount. This application is signed and passed in to the teller by the person making the application together with the money and the applicant's bank book. The teller counts it and if correct will enter the amount with the date and his own initials in your bank book. The entry is your receipt. As a rule it is not wise to mention what amount you hand a person in payment, watch them count it and let them tell you. If you in mistake handed them more than you thought you did, a dishonest person would keep it because you had told them there was only so much there. Unless you tell them they have no way of knowing how much you expect them to find. When receiving money from any one, always count it in their presence. A cashier in a bank will rectify no mistakes after a person has left the window.

A mortgage is a conveyance of real or personal property by way of pledge for the security of a debt, with the agreement attached to it that it become void if the debt is paid.

A deed is an absolute conveyance of real property. In this country a wife has a "right of dower" or one-third share of her husband's real property after debts are all paid. After marriage if he wishes to mortgage or deed a certain piece of land, he cannot do so unless his wife signs the deed or mortgage. The law also provides that she cannot be forced to sign any such document by threats or fear, only by her own free will. This gives her an opportunity to say she does it in fear, if it is so. She also has the right to have it read to her and explained carefully by the magistrate. It or any other paper should be signed with the person's given name and husband's surname. A seal is usually placed opposite each signature and the signer has to acknowledge that seal to be his for the purpose therein contained. The idea of the seal is that th person signing does still another act than sign to hold them to the agreement, they acknowledge before witnesses that they have also put on this seal to bind the bargain.

It is always unwise to sign any paper without fully understanding what it entails, as it is the legal way of conveying rights which can be transferred in no other way, and when done it is a most difficult matter to undo and practically impossible.

Keeping a strict account of the weekly expenses of the household is a proper part of the subject of this paper and one productive of great good and many surprises; surprises because of the small amounts spent sometimes foolishly, which in a year aggregate large sums; good, because it is a most particular way of learning to buy to better adavntage. Eaton's, Simpson's, Barker's, local merchants, including, of course, the Farmers' Ltd. can rightly all come in here for discussion, but my paper is already too long and I fear my listeners are weary.

HAPPINESS

There are milions of ways to be happy
and only one way to be rich,,
The king with his treasures may envy
the toiler who digs in the ditch,
For the king is a slave to his station,
but the toiler each evening is free
To follow his fancy of gladness whatever it hapens to be.

There's joy in the smile of a comrade,
and joy in the blue of the sky.
Who lives in the sunshine of friendship has joy that no money can buy.
There is peace to be found in the valleys and calm in the shelter of trees,
And millions of people are happy in claiming such pleasures as these.

The man that is proud of his children
owns more than the man with his gold,
And he that has chummed with the songbirds has found a delight he can hold;
There are millions of ways to be happy, too many by far to recall.
And who lives but for gold and for silver has chosen the poorest of all.

—Edgar A Guest.

CARE OF THE HAIR IN WINTER TIME.—COLD WEATHER IS PARTICULARLY TRYING ON THE HAIR

It is not a generally known fact that hair needs different treatment in winter than in summer, one reason for this being that it becomes twice as dry in cold weather as it does in the warm season.

Dry hair is unmanageable, it does not lay properly and detracts from your good looks. But there are worse things reulting from hair in that condition; dandruff follows, the hair becomes brittle and also becomes thin unless it is cared for and the scalp kept healthy.

Water affords only temporary relief for the hair and frequently does more harm than good as it increases the stiffness of the hair when it dries out.

For the cold weather apply some mixture containing good oils, and brush the hair frequently and thoroughly. The oil will neutralize the dry condition about the roots and scalp, make the hair easier to handle, and cause it to stay in place. Massage the mixture well into the scalp and it will prove a mild tonic which will benefit you.

One of the best mixtures for winter treatment of the hair consists of sixteen ounces of pure cologne and two ounces of refined castor oil. One would think this a rather greasy mixture to apply, but it is not. It is easy to apply, does not make the hair or scalp greasy or shiny and is agreeable in feeling and odor.

If you find you have neglected to keep your hair properly moist during the cold months and need a stronger tonic, use bay rum. To apply this, part the hair every few inches all over the scalp and dub the liquid in thoroughly with the finger tips or with a very soft brush. Use either of those mixtures three times a week unless the hair is excedingly dry, in which case, use it every other day for two weeks. It is best not to use it too frequently as it will make the hair too oily.

So many women complain that their hair seems to fall out only in the winter, that it is surprising they do not realize that the cold weather has something to do with it. If your hair is coming away in the comb during the cold months, you may be sure you have neglected it so much that continued dryness has caused this condition. To remedy this use alternately bay ru mand vaseline. Rub this into numerous partings of the hair every other night for a week.

Perhaps some may hesitate about going to this trouble, but nothing turns hair grey so speedily as continued dryness due to all absence of nourishing oils.

EVERY NURSE SHOULD KNOW

That the nerovus patient should have eight or nine hours of sleep.

That sleep will be slow in coming if the sick person is allowed to have company just before bedtime or listens to exciting reading.

That one should never ask a sick person, "What can I do for you?"

That dainty service often counts more than quality or variety in the invalid's meals.

That the nurse should never save steps when the patient's appetite is capriciouus. A small portion often tempts where a larger one nauuseates, An extra trip to the kitchen is better than heaped-up trays.

That a sick room should never be made a thoroughfare or the gathering place for the family.

That sponging with alcohol and watre will reduce fever several degrees.

That, if possible, a patient should be induced to give up tea and coffee during convalesence. In a weakened condition they are apt to induce nervousness and sleeplessness.

That having a patient hold her breath will often prevent a spasm of coughing.

That persons subject to rheumatism or weak heart should not take baths that are ice cold.

OATMEAL RECIPES

Oatmeal Macaroons.—Cream together 1 tablespoonful butter, 1 cup of brown sugar, 2 eggs, 1 teaspoonful vanilla, 2 large cups of rolled oats in which is mixed ½ a teaspoonful of soda, 1 teaspoonful cream of tartar. Bake in gem rings. If not wet enough add a drop of milk, also a pinch of salt.

Oatmeal Cookies.—Three cups of oatmeal, 2 cups flour, 1 cup of shortening, 1 cup of brown sugar, ¼ teaspoonful soda, pinch of salt, sour milk to wet.

Oatmeal Cookies II.—Two and a half cups oatmeal, 2¼ cups flour, 1 cup sugar, 1 cup shortening, flavor to taste, ½ teaspoonful soda, pinch salt, sour milk or cream to wet.

Bran Muffins.—1 egg, 1½ cups of sour cream or milk, 2½ cups of bran, 2½ cups of flour, ½ cup sugar, pinch of salt, small teaspoonful soda. Drop in rings.

Rolled Oat Bread.—3 cups rolled oats, 6 cups standard flour, 3 cups boiling water, 3 tablespoons molasses, 1 tablespoon lard. Scald rolled oats with hot water. Cover and let cool until lukewarm. Add ½ yeast cake dissolved in warm water. Add the flour (perhaps a little more than the 6 cups). Let rise over night. Put in pans. Let rise. Bake 1 hour.

QUICK GINGERBREAD

1 cupful molasses.
1 level teaspoonful bâking soda.
2 tablespoonfuls boiling water.
½ cupful thick, sour cream.
¼ cupful brown sugar, scant.
1½ cupful flour, about.
2 level teaspoonfuls ginger.
1/ level teaspoonful salt.

Time: Preparations, 10 minutes; baking, 30 minutes.

Number served: 6 persons.

Dissolve the soda in the boiling water. Heat the molasses slightly, and add the dissolved soda; pour this over the sour cream, add the sugar, mix and stir in gradually the flour. Beat well, pour int oa square greased pan, and bake in a moderate oven about 30 minutes. The batter should not be too stiff. Serve warm. With cream, plain or whipped, this makes an excellent luncheon or dinner.

THE CARE OF HOUSE PLANTS

House plants are of two classes: the first class including ferns, palms, rubber plant and others generall described as foilage plants, and the second class consisting of such plants as geraniums, tulpis, narcissi, cyclamen and other favorite. These are known as the flowering plants. The latter must be grown in that part of the house where the light is best. The foilage plants will do better in parts with less light.

Plants must receive thorough and constant attention to succeed well because they are not like bric-a brac and any injury they receive, if left without attention, may have serious results. The purpose of most house plants is to brighten the home during duil winter months, and when they do this they are worth considerable attention.

The fundamental condition for success is that relating to atmosphere. The atmosphere must not be too dry. If the house is heated with hot air, pans of water should be placed wherever possible to increase th humidity of the atmosphere. Soil is also important and should never be left to become thoroughly dry. Watering should be done regularly or whenever required. In the winter no plant should be allowed to go without water longer than two or thre days, and in summer probably daily watering is a better rule to follow.

Injury some times results from over-[illegible] pots should not be allowed to sand in water, otherwise the plants are liable to turn yellow and sickly, but more often plants become sickly owing to the fact that the atmosphere is not moist enough. This is generally indicated by the leaves withering from the tip towards the stem. Extreme changes in temperature are also undesirable. Plants do best when kept in a temperature which never goes much higher than 70° F. and does not ever fall below 50° F. even during the night.

One very good method of telling whether a plant needs watering is to tap the pot with the knuckle and if the pot rings hollow it is a sure sign that it needs watering. All pots should be supplied with good drainage. This is generally supplied in the form of broken crocks which are placed in the bottom of the pot. This allows any surplus water to run out through the hole in the bottom which is made for this purpose.

Fresh air is beneficial, but not in the form of direct draughts. Tender house plants are always susceptible to draughts. Palms and ferns are better for sponging once a month as this keeps them free from scale insects. Most plants are benefited by a yearly repotting.—F. E. Buck, Assitant in Ornamental Gardening.

SHARPENED SCISSORS

The average person usually opens and closes a pair of newly sharpened scissors several times, apparently to test their sharpness. Though this is done with good intent it invariably injures the finest edged blades and much of the result of careful sharpening is lost.

A trick well worth knowing, as soon as the blades are sharpened, is to close them with the fingers of one hand, at the same time springing the blades apart with the fingers of the other hand, not allowing them to touch until closed, then slowly open in the ordinary manner. This moves the barb in the right direction and will greatly fengthen the life of the scissors.—L. B. Robbins.

We don't want hard times, we don't want discontene but we do want a realization that we are shirking our duty when we do not make every acre and inch yield to its utmost—not the utmost we have been satisfied with heretofore, but the utmost of science and skill and grim determination.

Fruit Packages

We Manufacture Strawberry Boxes and Crates for same, 6 qt. Baskets, Apple Boxes, Box Shooks, Apple Graders, Wheelbarrows. Now is the time to lay in a supply of Fruit Packages for the coming season. We have a good stock on hand, order early and ensure prompt shipment. Price on application to

HANTSPORT, N. S.

PREPARATIONS FOR WINTER IN THE ORCHARD

Make allowances for surface drainage, if necessary, for standing water in an orchard during the winter and early spring will cause inestimable damage.

In many otherwise well-drained orchard areas, the conformation of the land is such that in localized spots of small extent a certain amount of surface water, which is always in abundance from melting snow and heavy rains, cannot find a ready exit. Preparations for coping with such a condition should be made ilate in the fall. It is simply accomplished by merely running a few furrows, preferably with a double mold board plough, or by turning two furrows, one on either side, in such amanner as to make an even ditch with a good fall to some convenient part of the orchard vicinity which can take care of excess of surface water.

Protection against the depredations of mice, especially on young trees, is one of the important points in the orchardist calendar. The first consideration in this regard is to remove all rubbish lying about the orchard which may serve as a refuge for rodents. As young trees may sometimes be completely girdled by mice or rabbits during a severe winter when their green food is scarce and they are obliged to eat the green bark of the trees, some sort of protection should be given annually. This may take the form of wrapping the trunk of the tree with ordinary building paper and tying with binder twine. This is generally considered the cheapest and most effective protection. Failing this, a mound of earth, eight to twelve inches high, may be tramed about the trees, or even a mound of snow may give some protection and prevent the mice from gnawing the bark close to the ground where the yeusually work. This protection, if either the paper or mound method is adopted, should be applied before winter sets in. The paper is by far the more satisfactory method, and will often pay for itself many times over. Nothing is more discouraging than to lose a large number of young trees ,about ready to bear, by the depredations of mice.—M. B. Davis, Assistant in Pomology.

WINTER STORAGE OF SQUASH

(Experimental Farms Note.)

Squash to be carried successfully in storage must be well matured and free from bruises, broken stems, cuts or frost injury. If one disposes of the well colored, best matured squash and tries to keep those not well ripened, failure is likely to result under the most favorable storage conditions. A squash may be sufficiently matured for immediate use, but not be suitable for storage. In selecting for storage, therefore, pick out those which have had the longest period of growth, and just here it might be said that to get a large proportion of the crop for storage, due attention must be paid to having the plants started early. It is well also to burn the squash occasionally when growing in order to develop a hard shell on al sides. They should be handled carefully and placed imemdiately in a well ventilated, dry room with a temperature around 80 degrees until the shells are hard and dry and then removed to a cool but dry light and well ventilated room. Under such conditions we have been able to keep squash until spring in perfect condition.—W. S. Blair, Supt. Experimental Station, Kentville, N. S.

FREEZING INJURIES TO POTATOES

Three distinct types of injury occur during "cold snaps," all of which are very common:—

Freezing solid. If potatoes are actually frozen solid throughout or on each side they become soft and mushy when thawed and are easily detected and sorted out in storage lots. Freezing is often limited to one side of the potato which may have projected above the soil or may have been in contact with a cold wall.

Turning sweet. Tubers stored at low temperatures 29 degrees to 34 degrees Fahr., for a month of more, turn sweet. This turning sweet is popularly termed chilling, and is supposed to be due to slight freezing injury. This is incorrect. It is due to prolonged low temperatures but not to ice formation in the tissues, and hence is not a sign of freeing injury. Potatoes which have been slightly frozen do not necessarily turn sweet, and on the other hand,potatoes may be sweet because of prolonged cold storage without having been frozen or frost-bitten at all.

Internal freezing injury or frost necrosis. If potato tubers are exposed to severe frosts (temperatures below 28 degrees Fahr.) for a short time, many of them will, upon cutting, show dark discolorations in the interior flesh. These internal symptoms of freezing injury vary considerably in appearance, but they have certain characteristics in common. They are generally most marked at the stem end, and in cases of slight injury are limited to this. They cannot, as a rule, be detected by the external appearance of the tuber although upon storage such injured tubers wilt more than normal ones.

The discolorations most commonly appear as dark blotches scattered irregularly through the flesh, especially in the outer flesh. Very often, however, fine lines combine to make a netted or ring pattern. Sometimes these may be mistaken for certain tuber diseases unless the possibility of frost is understood.

Generally, during mild exposure, certain tubers succumb, while others nearby, under like conditions, are unharmed, an indication that certain tubers are more susceptible to frost injury than are others.

Do not plant potatoes which show freezing injuries. They may grow because the sprouts are more resistant than the body of the tuber, and there, fore, mild injury may not kill the eyes. Seed tubers which have been frosted usually sprout more slowly, however, and are liable to rot before the plants are well established on their own roots.

Can Control Freezing Injuries

Watch the temperature of your storage room in winter. A simple way to do this is to have a tub of water near the potatoes. Water begins to freeze at about 32 degrees Fahr., and potatoes at about 28 degrees Fahr. Ice formation in the water, therefore, serves to give timely warning of impending danger to the potatoes and at the same time, if there is sufficient bulk of water, it will, in freezing, actually release heat which retards the fall of air temperature. Actual freezing does not begin in potatoes until the temperature drops below 28 degrees Fahr. An oil stove or one or more lighted lanterns will often prevent potatoes from freezing in cellars.

If potatoes are shipped during cold weather in a heated car, provide for circulation of air from the stove to all parts of the car. This will prevent black heart in potatoes near the stove and frost injury in those in the outer parts of the car.

ROTS OF POTATOES IN STORAGE

The keeping quality of potatoes is mainly determined by the treatment of the growing crop. The commonest source of loss in storage is the late blight rot (the so-called dry rot, which, however, is sometimes anything but dry), which is carried from blighted leaves to the tubers by rain. A comparatively small number of infected potatoes may destroy a large proportion of the crop in storage if conditions are favorable to the rot to spread.

The blight may be largely controlled by spraying the foilage thoroughly with Bordeaux mixture. The crop is thereby largely increased, an addition equivalent to one quarter of the crop being usual in districts where blight is prevalent. Furthermore, the loss from the blight rot is reduced to small proportions . Cases have been recorded by growers in which nine-tenths of the unsprayed portion of their crop rotted after being stored, while there was practically no rot in the sprayed

Renew the Soil
Make Your Farm Pay Better

SOIL renewal as practised in Europe accounts for the very high yield per acre attained in European farms, and soil renewal simply means restoring plant food and humus.

This is done by applying ordinary stable manure and commercial fertilizers.

Harab-Davies Fertilizer is a scientific compound which contains Nitrogen or Ammonia, Phosphoric Acid and Potash in readily soluble form.

Experience absolutely proves that it is more profitable to work 50 acres with a good fertilizer than 100 acres without it.

MONARCH FERTILIZERS

Fertilizing means not only **bigger** crops, but **better** and **stronger** crops.

It is strictly a quality article. Pound for pound it is positivelythe **cheapest** as well as the best fertilizer offered.

Write for our booklet, "Fertilizer Results by Satisfied Users"—sent free on request. Read what farmers in all parts of Canada have accomplished with Harab-Davies Fertilizer.

portion.

At the same time spraying has to be backed up by other precautions to get the best results. Potatoes do best on light, well-drained soil, while heavy soil favors the rot. High hilling helps to protect the tubers by giving them a good covering of soil, and the practice will not be found harmful in the moister sections in which late blight is prevalent. It is better not to dig a partly blighted crop until the tops have become entirely dead unless conditions are very moist. The crop should be harvested with as little injury as possible, injured potataoes being very susceptible to decay.

After the rotted potatoes have been picked out, th crop is best stored in a cool, dry, dark cellar with an earth floor. When rot is feared, however, the potatoes should be separated from walls and floor by closely slatted wooden frames. Teh cooler the crop is kept, sort of freezing, the better the crop will keep.

Other less common storage troubles are the Fusarium dry rot and bacterial soft rot. The former is generally found in spring, the potatoes being more susceptible at that time. It is agravated by high temperature and wounded tubers, and may be held in check by attention to these points. The bacterial rot is generally found after an attack of black leg in the field. The source of infection should be eliminated another year by using disease-free seed.

For information on spraying consult circular No. 10; on black leg, circular No. 11; on general treatment of the potato crop, Bulletin No. 90. All are free on request from the Publications Branch, Department of Agriculture, Ottawa.—Division of Botany.

Make Money This Winter—Saw Wood
There is big money this winter sawing wood. Coal is high. Wood will be scarce. Now is the time to clean up. The
GILSON HEAVI-DUTI SAWING OUTFIT
is the machine to do it with. Makes its own spark without the aid of batteries. You cannot afford to buy any engine until you know all about the Gilson Heavy-Duti. When you know about it, you will not buy any other. Catalog and information free if you act quickly. Write to-day.

FORCING BULBS IN THE HOUSE

(Experimental Farms Note.)

Bulbs when properly forced make splendid house plants and come into bloom during two of the winter months which most need the brightening effects of their rich colors. "Bulbs" is a general term which includes Narcissi, Early Tulpis and the more recent Darwin Tulips noted for their elegance of form and range of rich colors.

After the bulbs have been potted the next essential is to induce an abundance of root growth as quickly as possible. The proper root development will determine the subsequent size, vigor and lasting qualities of the flowers. Explicit advice in this connection is, first, choose as the storage place for the pots the coolest, darkest and dampest part of the cellar —or the vegetable storage room is very suitable. Second, provide a condition which approximates as nearly as possible the condition they would have if planted in the ground outside. One thorough watering at the time of potting may be sufficient, but in most cases it is not, therefore water regularly is often as the top soil shows signs of dryness. Another method is to plunge the pots into damp sand and keep the sand moist. Provided the place is not too cold, or they are not kept exceptionally wet, rooting will proceed satisfactorily and toward the end of December the roots should begin to fill the pots. Third, after two months or ten weeks has elapsed bring the pots into a lighter place and water even more regularly and frequently. Allow them to make about three inches of growth and the growth to change to a good green color then bring some of the pots into the full light and warmth. Very rapid and healthy growth should soon result.

A few words of advice as to what not to do. First, do not on any occasion place the pots too near the furnace or near the hot air outlets; dry warm air is disastrous to healthy plant growth. It drys out the soil and hardens the roots; it stnuts the foilage and shrivels up the blossoms. Second, do not over-water at any period; the soil should be kept always moist but never soggy and cold, and do not allow the pots to stand in pans of water. Third, do not allow the plants to experience too violent temperature changes. At the time of rooting the temperature may range from 35° to 45° and after the plants are brought into the light it should range from 50° to 70°. Higher temperatures during the day, due to combined furnace and sun heat, may not hurt the plants but they are apt to be materially injured if forced to experience several hours of dry, high temperature during the evening when they should enjoy the resting period always provided for them under natural conditions.

Flowers with little or no stem and plants with a stunted growth are due to improper forcing methods. Bulbs appreciate the sunshine and when in the flowering stage also respond to and should have abundance of water. —F. E. Buck, Assistant Horticulturist.

"MORE BEES, MORE FRUIT"

Without an exception experts on orchard fruits are recommending the keeping of bees in or near an orchard, to assist in pollination. This course is recommended in addition to the planting of a certain number of trees of other varieties that are known to be pollinators, in large orchard blocks of one particular variety. It has come to be recognized that bees are one of the most valuable assets that the orchardist can have, and that the bee-keeping industry should be stimulated and protected in orchard districts in every way possible. In fact, it will pay the orchardist to make a study of the bee-keeping industry, and to place as many hives as he believes will secure the necessary food in or near his orchard, regardless of the income he may secure from the honey.

This course has been advised by many prominent fruit growers in the Northwest. In Washington a campaign is being conducted to raise more bees and to protect them. In California the same action is being urged, while the matter is also receiving the endorsement and aprpoval of a large number of growers in Oregon.

A good slogan in waging this campaign for increasing the number of these valuable insects would be "More Bees, More Fruit", and every orchardist should bear this in mind.

The coleletion and study of insects provide both recreation and education and will result in the extension of our knowledge of Canadian insects. From a practical standpoint it is important that there should be a wider knowledge of entomology especially among the teachers in our schools. In order that such knowledge may be applied to the control of these insects, whose destructive or annoying habits make their supression necessary, Entomological Circular No. 12 entitled, "Directions for Collecting and Preserving Insects" by J. H. McDunnough, M. A., Ph. D., may be obtained free upon application to the Publications Branch, Department of Agriculture, Ottawa. The object of this circular is to indicate as concisely as possible some of the most essential features in connection with the collection of insects. It is intended largely as a first aid to those anxious to learn the elementary principles of insect collecting in order that they may profitably occupy leisure moments.

Stiffness

It is astonishing how quickly Minard's Liniment relieves stiffness and lameness.

Gives Great Relief

Mrs. A. R. Calcott, 26 Park Ave., Guelph, Ont., writes—"My husband has used Minard's Liniment frequently, always with good results. Frieods of mine use it for rheumatism and tell me that it gives great relief."

Mrs. Fred Johnston, Box 735, Thorold, Ont.—"I suffered very much with neuralgia in my face last winter, was advised to try Minard's Liniment, and was relieved immediately after first application. I persevered in using it and it has entirely gone. This winter I can go out without tying up my face and give the credit to Minard's Liniment. Have told several people about Minard's, and others are using it."

MINARD'S
King of Pain
LINIMENT
Yarmouth Nova Scotia

Gleanings From the N. S. Agricultural College

N. S. DAIRY COWS

The records made at Amherst by cows from the College herd, Truro, following as they do other championship records made by Nova Scotia cows, demonstrate again possibilities of this Province in the breeding of dairy herds. The simple fact is that we can produce here as good cows as can be bred anywhere in America. It is worth noting, by the way, that this year's champion scored considerably higher than any on exhibition at Guelph.

It would not be in any sense an unreasonable aim, in the circumstances, for dairymen to make Nova Scotia a Mecca for ambitious buyers from outside. The College has already fancy offers for Gardrum White Floss, the beautiful Ayrshire which carried off this year's honors at the Winter Fair. Certainly from the point of view of sale prices it pays to breed the best.

This, however, is only one of the advantages of good breeding. As an asset on the farm the difference is at least equally great. When one states that the milk production of the average N. S. cow is about ,500 lbs. per year, while that of pure bred herds runs as high as 14,000 lbs., no further argument need be added.

DEMONSTRATION CREAMERY AT THE WINTER FAIR

Our always wide-awake Dairy Division operated a demonstration creamery throughout the period of the Winter Fair at Amherst. A complete equipment was installed and a churning demonstration carried on each afternoon from 2 to 5 p. m. Wholesome products were on sale daily at the counter.

A double purpose was served by this arrangement. 1. A good illustration was given of the way a creamery is operated. 2. A market was created for the products of the cows in the various dairy tests. Associated with the creamery was an exhibit o fup-to-date equipment for the handling of milk and cream. The management is tao be congratulated on the success of the undertaking, and in turn they were pleased with the interest shown by the public who visited the booth in large numbers.

N. S. FARMERS' ASSOCIATION

The farmers' Parliament of Nova Scotia, in other words, the Nova Scotia Farmers' Association, meets this year at Kentville, January 27th to 29th. This promises to be a particularly interesting session, coming as it does at a time when farmers are taking a prominent place, not only in their own established lines, but also in matters of Government administration.

THE MARITIME DAIRY SCHOOL

The committees appointed by the different Dairy Associations of the three provinces, looking toward the establishment of larger quarters for the Maritime Dairy School, met in Amherst during the Winter Fair. Plans were laid for the development of this work, and a sub-committee consisting of Hon. Walter M. Lee, of P.E.I., E. P. Bradt, of New Brunswick, and Dr. M. Cumming of Nova Scotia, was appointed to take the matter up with the authorities at Ottawa. When this project is realized a long step will have been taken toward better dairying condition in Eastern Canada.

SWAT THE SCRUB BULL

A notable article appeared in the last issue of aFrm and Dairy, a Canadian Agricultural Magazine published in Ontario, in which the writer highly congratulates the province of Nova Scotia, for the legislation passed last year aiming at the elimination of the scrub bull. To put it in a word, the Act referred to makes it illegal to keep a scrub sire for service within the boundaries occupied by any Agricultural Society. There are 275 Agricultural Societies in Nova Scotia. The chief difficulty in the way of the enforcement of this Act is that up to the present only a few Societies have properly defined their aras. However, this difficulty will soon disappear, as they are now falling into line and so placing themselves in a position to profit by the Act.

In the Province of Ontario vigorous propaganda work is being carried on to the same end. Public meeings are being held and every effort is beind put forth to develop a policy to exterminate once and for all this miserable and persistent obstacle to live stock improvement. If Agricultural Societies in this Province will now hasten the work of defining their areas, they will place Nova Scotia in the forefront of the Dominion so far as live stock legislations is concerned.

CLOVER SEED FOR 1920

It is not necessary to argue at any length at this date how essential it is for the man who wishes to improve his land to sow the largest possible area to clover. All that need be said is summed up in two propositions: 1. Clover is the most nutritious bulky food for live stock that can be grown on our farms. 2. It enriches the field on which it is grown.

From the standpoint of its more general use, it is unfortunate that the price of clover seed is this year advancing considerably over the high prices of last year. One result of this advance will be to make dealers wary in buying. No merchant wants to hold over an expensive stock that is deteriorating in quality with age, and that is only in demand during a few months of the year. If seed merchants and co-operative societies buy lightly, there will be many farmers who will find it impossible next Spring to secure a supply of clover seed.

The obvious remedy for this situation is that farmers put in their orders now for next Spring's supply. This will assure the merchants and enable them to buy in sufficient quantities.

It is worth noting that the real way out of the present shortage and high prices for clover seed is to grow much more at home. A considerable number of communities have this year taken advantage of the facilities provided for hulling the clover crop, and will realize well on their efforts. There is room for a big increase yet and few measures that can be taken would yiled so good an all round return.

RED CLOVER VERSUS ALSIKE

With the pricevs of clover seed at their present level, and still going up, it is well worth while to consider the relative value of Red Clover and Alsike. The price of Alsike is lower, and, the seed being smaller will go much farther. It is the hardier crop, and will give better results on poorly drained land than red clover. It is also a richer fodder, one pound of Alsike containing as much food for dairy cows as one and one-third pounrs of the other.

Red Clover is, of course, the heavier yielder on dry, well drained land, and the superior nutritive qualities of Alsike will not balance this difference in yield. Nevertheless, the man who is determined to cut down his outlay for seed, and the man who has wet land tot sow in clover would do well to tuurn to Alsike.

N. S. POULTRY ASSOCIATION

The Annual Meeting of the Nova Scotia Poultry Association will be held in the Agricultural College, Truro, Tuesday, aJnuary 13th, at 10 a. m.

Each County Poultry Club which is properly organized is entitled to send one delegate for the first fifty members or less, and an aditional delegate for every additional fifty. These will be entitled to transportation by railway and hotel expenses at Truro.

Delegates should secure standard certificates when buying their tickets to Truro. Without the standard certificate the railways will give no special rate. Each delegate should also obtain a receipt for hotel account, and a refund of these expenses will be made on their presentation at the College.

Every organized Poultry Club should call a meeting to select a delegate or delegates to this Annual Meeting, as some very important matters concerning the future of the poultry industry will be considered. The delegates so appointed should bring a report for the year from the club they represent.

An opportunity will be given all the delegates who attend the meeting to look over the birds, pens, etc., of the First Nova Scotia Egg Laying Contest now being conducted at the College Poultry Plant.

N. S. DAIRYMEN'S ASSOCIATION

Arrangements are being completed for the Seventh Annual Convention of the Nova Scotia Dairymen's Association. It will be held at the College of Agriculture, January 22nd and 23rd. The usual ehibits of creamery butter will be on hand. There will also be exhibits from the Dominion Educational Butter Scoring contest. Mr. Geo. H. Barr, chief of the Dairy Division at Ottawa, and other prominent men high up in dairy circles will be present at this convention, which promises to be the best yet held.

GOVERNMENT CREAMERIES IN CAPE BRETON

Several years ago the Nova Scotia Department of Agriculture began in a systematic manner to encourage the dairy industry in Cape Breton. This was done because it was evident to any trained observer that certain districts could never hope to make a great success of any other branch of farming, and they were comparatively promising along dairying lines. In 1914 the Department opened a creamery at Baddeck, and, two years later, one at Margaree Forks.

The natural conditions were not favorable to a rapid growth, and development at first was very slow. The efforts of the Department, however, were directed rather to the laying of a good foundation than to spectacular results at the beginning. The present year has witnessed a notable advance, and the wisdom of the undertaking is now well established. The following tables give a brief summary of two yearh' business at these creameries.

Baddeck—

1918 — Butter manufactured 37,309 lbs., valued at $17,78.

1919 — Butter manufactured 59,443 lbs., valued at $32,968.

Margaree—

1918 — Butter manufactured 31,334 lbs., valued at $14.225.

1919 — Butter manufactured 52,977 lbs., valued at $28,945.

The statement of business by no means tells the whole story. The influence of these creamries has been felt in th rural life of these communities in many ways. Many young men about Margaree who had decided to quit farming and go into other occupations, have recently acquired farms of their own, and are in a fair way to develope fine dairy herds that will turn in good profits. Farm lands have greatly increased in value. There is a keen demand for the higher classes of breeding stock, and the scrub bull has been eliminated in a number of sections where a few years ago he was the rule. Social, educational and religious institutions all feel the benefit of increased prosperity.

The outlook is bright for the future. Next year it is proposed to gather the major quantity of cream by motor truck. This method will be an advantage particularly to outlying sections. The work is still only in its initial stage, and development should be very rapid when the peole generally take earnest hold of it.

PRIZE WINNERS AT THE FAIR

Gardrum White Floss, an Ayrshire from the College herd, won in the three days' Dairy Contest over all herds. She made a score of 270.97, averaging 66 lbs. milk per day, with an average test of 4.41.

The 3 year old Holstein, Mechthilda De Pride, was third in her class with a score of 230.73.

Gardrum White Floss has a sister called Gardrum Floss, which has had only one lactation period, freshening Oct. 28th, 1918. In tbe next twelve months she gave 10,682 lbs. of milk, testing 4.23 of butter fat. This is not a phenomenal record, but it is a fine beginning.

Both Gardrums are out of Scottie's White Floss. This cow has a milk record of 12,529 lbs., testing 3.94, and equal to 618.66 lbs. butter. These three cows are still in the College herd.

It will be remembered that this year's highest score has been excelled by others in past years, notably by a cow owned by Mesrs. S. Dickie and Sons, of Onslow, which scored some 332 points, the highest record ever made in Canada by a Holstein.

THE COLEGE OAT CROP

This year's oat crop at the College was a very heavy one. The following statement will show that there was considerable variation in the yield of different varieties.

"Early Blossom" yielded 71.7 bus. per acre.

O. A. C. No. 72 yielded 79.8 bus. per acre.

Banner P. E. I. yielded 81.5 bus per acre.

Banner N. B. yielded 68.5 bus. per acre.

Maine 340 yielded 61.7 bus. per acre.

A nine acre field, Banner yielded 65.1 bus. per acre.

These yields are above the average, and the College will have some seed for sale. For information regarding price and varieties write to the Agricultural College, Truro.

WHEN PIGS ARE FIT FOR SERVICE

The age at which to breed young sows will naturally depend somewhat on the growth they have made. Seldom is it advisable to breed them until they are eight months old, and many breeders prefer to wait until they are ten or twelve months old.

If the boar should be put to service too immature, he cannot be expected to get vigorous pigs. He should not be used before eight months of age, and it will be more profitable in the long run to defer using him until one year of age.

FITTING STALLION FOR SHOW

(Continued from page 237)

drinking of copious quantities of water increases the assimilation of food. Plenty of salt and free access to water is the way to accomplish this end.

To keep a horse in healthy breeding vitality it is also necessary to pay close attention to his feet and coat, and plenty of exercise is an absolute necessity.

There is no other way in handling stallion colts from start to finish than by keeping them in vitality fit for service. Stallion colts handled any other way will prove failures though they may be prize-getters. To help towards getting the best out of breeding operations with the stallion, the breeder must equip his barons with proper stabling and the right kind of grass paddock. Hundreds of good stallion colts are ruined every year because the owners are not equipped to handle them. When not rightly handled or properly fed, it will be found far better to turn them out as geldings. Pure breeding or show feeding is of little avail to the utility of the breed if the horse is pampered for any other special feature. This is where many awards at exhibition give a false value to the animal, and the reputation he gets in the showing is not the last word in horse breeding, though many owners have no other apparent ambition.

ICE SUPPLY ON THE FARM

In the temperature and in many cases extreme climate of Canada, ice is as much required in the summer as it is easily procured in the winter. In some parts, it is true, while climatic conditions are favorable, streams, lakes, ponds, etc., are far apart. In the majority of cases, however, the failure to take advantage of a naturally supplied commodity that is at once a luxury and a necessary adjunct to success in several lines of farm work —is clearly the result of shiftlessness or laziness.

Source of Supply.—The source of the ice supply should be reasonably clear, free from current, and as pure as possible. The area to be utilized should be kept free from snow during the early part of the winter so that the ice may be free from slush or surface ice.

Quantity Required.—If any estimate may be made of the daily requirement for say four months, the amount to be harvested may be roughly calculated. A cubic foot of ice weighs 57½ pounds approximately. A daily consumption of ice of 115 pounds (2 cu. ft.) would amount to about 7 tons during the season of use. Allowing for wastage, a building 10′ x 10′ x 10′ would supply ample space, with careful packing. Another method of estimating, used by dairymen, is that approximately 1½ tons of ice will be required to cool the milk of the average cow.

Storage.—The ordinary storage of ice is a simple matter provided certain essential features are included.

1. The buildings should have no floor other than a foot or two of stone —boulders at the bottom grading up to small stone or cinders at the top. On top of this should be placed one foot of sawdust.

2. The walls may be single boarded, but are best sheathed inside and out leaving an air space the width of the studding. At least a foot of sawdust should be placed between the ice and the walls.

3. The roof should contain a ventilator and two windows to draw off the heat from the ice.

4. The opening for filling should either be continuous or consist of a series of doors one above the other. By using a wooden slide or gangway incline from the ground to the ice-level, filling it easily accomplished with a horse, a block and a length of rope with a noose at one end.

Note.—For detailed description of small ice-houses, cold storages, etc., procure bulletins Nos. 20 and 49 from Publications Branch, Dept. of Agriculture, Ottawa.

General Advice Regarding Storing Handling.—1. Keep each tier of blocks level. Try to cut or obtain all blocks as nearly one size as possible. Fill all crevices and cracks with crushed ice or snow. Make the mass as nearly a solid block as possible.

2. Use fresh sawdust as a filler. Planer shavings, while a substitute, are too coarse. Cut straw, or hay, chaff, etc., may be used, but are not so good as sawdust. Where such material is used leave a space of two feet between the walls and ice.

3. Place no sawdust between the tiers of ice, but see that it is well supplied elsewhere. Leave no spaces unfilled. Place one foot to eighteen inches over the top.

4. From the time the ice is covered, and during the summer, inspect the ice-house carefully from time to time. Fill all holes caused by settling and wastage and rake over the top of the sawdust to form a mulch of 3 inches or so of dry sawdust. A little care in this regard will be responsible for hundreds of pounds of ice saved.

Utilization.—As to the utilization of ice little need be said. Suffice it to mention that **many of the gravest defects in our dairy products to-day would largely disappear with the prompt cooling of the fresh milk.** For the proper maintenance of household economy ice may seem a luxury at first. Once used, it becomes a necessity. One of the most satisfactory buildings on the farm is the ice-house, or better, the automatic refrigerator or cooling room in conjunction therewith.

G. B. ROTHWELL,
Acting Dominion Animal Husbandman.

COW'S AGE BY THE RINGS ON HORN

How can one know the age of a cow by the rings on the horns? A. G.

Most people "read" the rings of the horns incorrectly. At about two years of age a small ring appears at the base of the horn and another at three years. Then these two preliminary rings fuse and almost disappear; but a deep ring soon forms and indicates the fourth year. Correctly to judge age from the horns one should count the smooth tip and the first slightly marked ring as representing three years, and add one year for each additional ring. In the aged animal there is a marked depression or lessening in circumference at the base of the horn which, together with loss of the broad parts of the incisors or great wear of those teeth, may be accounted unmistakable evidence of advanced age .

FIRE DON'TS

Don't put hay in mow until properly cured. Be careful also with damp fodder and straw, and bins of moist grain and seeds. Don't put new hay or fodder on old hay, straw or fodder —danger of spontaneous combustion. Clean floors thoroughly before storing hay.

Don't neglect to have ladder, buckets and water handy at all times, and to keep each in its proper place.

Don't smoke meat except in buildings removed a safe distance from other buildings, unless properly equipped to prevent fire.

Don't neglect to have all flues cleaned, examined and repaired at least once each year.

Don't pass stovepipes through ceilings, roofs or wooden partitions.

Don't allow children to play with matches. Keep matches in closed metal box.

"Making two blades grow where only one grew before."

1920 Fertilizer production will be an uncertain proposition

"Shur-Gain Fertilizer buyers should order a full supply at once and arrange for deliveries in January or February at latest. Strikes at the phosphate mines, railway car shortages and soft coal strikes have delayed raw material shipments to us and will affect the consumer too.

Here's the Evaporator to Solve the Syrup and Sugar Problem

Thousands of grove owners do not work their groves for very little reason. Lots of them just can't make up their minds. Yet if we were to put a proper outfit in their grove and they saw it work so easily and the money there was in it—for one season—they would fight to prevent us taking the outfit away again, even if the cost were a good deal more. An unworked grove these days is like an untapped reservoir with thirsty people around. A big demand and no supply. Why not put a

GRIMM CHAMPION OUTFIT

in your grove. One of a right size to work your bush to full capacity. Then there will be no waste and every dollar extra means more production. We can fit out any grove from sap spout to Champion Evaporator. Get in touch with us right away.

Our Shorthorns are about ready for the block. Parties wishing to start a herd can do so at reasonable prices from us. If not sold for breeding purposes, will go for beef. Both sexes, all ages. Come and see them before buying.

A few very nice Berks for sale.

L. M. ANDERSON, Sackville, N. B.

COW CHEWING STICKS AND STONES

I have a cow that is very restless and bellows occasionaly, also has a habit of chewing sticks and any rubbish she finds lying around that she can take into her mouth. What is the cause of this, and could you recommend a treatment —D. F.

It is generally believed that some condition of the soil and water, and of local vegetation is responsible for the trouble. It is more prevalent some years than others, and is most common where the soil is more or less depleted. Cattle pastures on low, swampy land become predisposed to it. It occasionally happens, however, that one individual in a herd suffers though all are fed alike; in such cases the disease must arise from an imperfect assimilation by the affected animal of the nutritive elements of the food which is supplied to it.

The aim in such cases must be to improve the process of digestion and to supply the animal with a sufficiency of sound and wholesome food. Give your cow a tablespoonful of the following mixture three times a day: Carbonate of iron, four ounces; finely ground bone or "bone flour" 1 pound powdered fennygreek, four ounces. Mix these together and in addition, three table spoonfuls of powdered charcoal may be mixed with the cow's feed three times a doy. A piece of rock salt should be placed where the cow can lick it at will.

IRON CEMENT

A permanent iron cement for filling cracks, and the like, may be made by simply mixing oxide of manganese and raw linseed oil, using enough oil with the manganese to make a thick paste. Apply this mixture to the pipe joint or leak. Remove the pressure from the pipe and keep it sufficiently warm to absorb the oil from the manganese in the paste cement mixture.

In about a day the cement will be as hard as the pipe or the iron tto which it is applied.—P. T. Hines.

CATTLE FATTEN QUICKER

Dehorned cattle take on flesh quicker. Their meat is tender and firm and brings a higher price. The KEYSTONE DEHORNER is used at the Government Agricultural Colleges. Write for Booklet. R. H. McKenna, 219 Robert Street, Toronto.

"YOU SEE IT'S A MARITIME FENCE"

Maritime fences will stand the severest tests, because they are built throughout of extra heavy hard drawn No. 9 steel wire. The superior stretching power of No. 9 wire keeps the strands from snapping under heavy strains or hard frosts. Each fence is thoroughly galvanised and will sturdily resist the rust and rot of weather.

STANDS THE TEST OF MAN, BEAST, WEATHER and TIME

The strands and stays are firmly gripped at every join by our special time tried and tested never-slip lock. Even after years of hard service, Maritime wire fence retains its sagless shape and sightly appearance. All Maritime Fences are carefully inspected and rigidly tested before leaving the factory. When you buy it you know you have got something that is bull strong and hog tight, something that will withstand greater strain than it is ever likely to receive.

Before you buy fencing it will pay you to first learn what the Maritime has to offer in the way of real fence service.

For sale by agents and dealers in nearly every section.
If you don't know the local dealer, write to us direct.

INVINCIBLE

FORMERLY CALLED MONARCH

IT takes a good boot to make a man ask for the same make every time, but that it just what you will do after you buy your first pair of "Invincibles". They will wear so long and give such good value that you will come back for them again and again. We know this to be true from past experience and every man you meet who has "Invincibles" on his feet will tell you so. You will know it yourself if you try them once.

"Invincible" Boots and Shoes, are built of the same tough tire tread rubber used for automobile tires, and like tires they are made by the high Pressure Cure Process. That is what makes them the toughest, strongest and longest wearing boot that money can buy.

Ask your dealer for "Invincibles" and get double wear for your money.

THE MINER RUBBER CO., LIMITED. 5

HORSE HAS ITCH ON MANE AND TAIL

My one horse is infected with a sort of itch. Every chance he gets he tries to rub his neck and tail-bone. It seems to infect the entire ridge of his back and mane. Can you tell me what to do for it? J. B.

Lack of grooming and consequent formation of dandruff substance at the roots of the mane and tail commonly cause the itchiness referred to. Then parasites may invade the affected parts and make the condition an aggravated one that is difficult to cure. Chicken lice sometimes start the trouble, or horse lice may be found present. At once wash the parts clean with soap and hot water. Do not repeat the washing. When dry pour on and rub in a little of a mixture of one part of kerosene and three parts of sweet oil, or machine oil.

Do this once daily for three consecutive days; then apply freely every three days a mixture of two ounces of flowers of sulphur, half an ounce of coal tar disinfectant or dip, and one pint of sweet oil or cotton-seed oil. Keep the stable celan and well ventilated and never let the horse stand for a single day without work or exercise. Once daily, until itchiness subsides, mix in his feed a tablespoonful of granular hyposulphite of soda.

The discomfort caused the horse by placing frosty bridle-bits in his mouth may be avoided by blowing the warm breath against the bits several times, or holding them against the horse's body.

Tuberculosis in Live Stock

Detection, Control and Eradication

By John A. Kiernan, Chief of Tuberculosis Eradication Division and Alex. E. Wright, Assistant Chief, Washington, D. C.

HOW THE DISEASE SPREADS IN A HERD

The tuberculous cow is the greatest source of danger to healthy cattle. Any reacting cattle not promptly removed from the herd constitute a source of constant infection.

Tuberculous cattle, sooner or later, begin to give off the germs of the disease. These germs escape by the mouth, nose, and bowels, in the milk, and other discharges. The discharged germs are carried in the air for a time until they fall to the ground.

Animals in adjoining stalls may take in the germs in the feed they eat and thus contract the disease. Continuous water troughs in barns containing diseased cattle are a source of danger. Drinking holes containing material from infected animals are likewise dangerous.

Failure to clean and disinfect the premises occupied by the diseased cattle constitutes another source of danger. Infected milking tubes and the practice of feeding calves with raw milk from tuberculous cows are the means by which tuberculosis spreads in a herd.

Present Knowledge of Tuberculosis

Probably no disease affecting either the human race or live stock is better known or has been the object of so much study as tuberculosis. Present knowledge of the disease is derived from many sources, including the work of eminent scientists who discovered its cause, and studies of the numerous ways in which it is spread, of the manner by which man and animals contract it, and the effects it produces.

The tuberculin test—the means of detecting tuberculosis — was devised in 1882 by the eminent scientist, Dr. Robert Koch. Thus the test has been known for more than a third of a century. The facts regarding it and other information presented in this treatise are based upon long experience and results verified many times. The methods recommended to be used in the eradication of tuberculosis have been tried upon large numbers of herds and found t obe effectual and practicable.

Early Eradication is Most Economical

Live stock owners are earnestly requested not to wait until the Provincial, States and Federal Government come into other localities to eradicate tuberculosis. It would not be possible indeed, at this stage to undertake to eradicate tuberculosis from the live stock of the United States and Canada solely through organized official forces established by the respective Provinces, States and the Federal Government. The area over which tuberculosis has spread is too vast, the herds are too numerous, and funds are insuufficient for conducting the work on so extensive a plan even though trained veterinarians were available in sufficient numbers to do the work. Every live-stock owner should be a party to this campaign which has been inaugurated to eradicate tuberculosis. In almost every locality of the United States and Canada are veterinarians capable of rendering valuable services to live-stock owners in this great work, and the cost of eradicating is greatly reduced by combating the disease in its early stages. Yet even in badly affected herds eradication can be undertaken with success. There are records of many herds, in which three-fourths of the animals were affected with tuberculosis, which eventually were freed from it and afterwards maintained in a healthy condition.

The extirpation of tuberculosis from live stock is important not only from an economic standpoint, but also because a considerable percentage of tuberculosis in the human family, especially among children, is positively due to the consumption of infected milk or other dairy products from tuberculous cows. It is eminently proper for the respective governments to expend funds for the maintenance of tuberculosis sanitariuums for the care of persons affected with that disease, and likewise it is extremely important to use vigorous measures to check the marketing of germ-laden milk. While it is true that proper pasteurization of milk destroys the living organisms of tuberculosis, a large part of the milk consumed daily is not pasteurized, and some of the milk so treated is not always made entirely safe.

Tuberculosis a Deceptive Disease

If tuberculosis were similar to foot-and-mouth disease in cattle, swine, and sheep, which causes rather spectacular symptoms, it would arouse immediate alarm among live-stock owners, who would insist upon its immediate eradication but because it is generally slow in developing and its symptoms commonly are not easily recognized from the general outward appearance of the animals, many people believe that it does comparatively little damage among live stock. Contrary to such opinions, however, the loss from tuberculosis is one of the heaviest taxes imposed upon our live-stock industry. amounting probably, to at least $40,000,000 a year in the United States.

Prevalence of Tuberculosis

In every Province, State and Territory in the Union and in Canada there is some tuberculosis among cattle and swine, though the degree varies considerably. In some States it probably exists quite extensively, the percentage varying from 5 to 30 per cent. of the cattle population, while in certain others investigation indicate that less than 1 per cent of the total of beef and dairy cattle are tuberculous.

Tuberculosis is known to exist also quite extensively among cattle and swine in all the European countries; in fact, no part of the world is known to be free from it absolutely. There are, however, some restricted regions where its presence is not known, or it exists to but a very moderate degree.

Until cattle from the eastern part of the United States were introduced in to the Middle Western, Western, and Southern States, tuberculosis among live stock in those regions was unknown so far as we know. The disease at that time was confined to the herds east of the Allegheny Mountains. It was known then that a considerable percentage of herds inthose States were affected, but live-stock owners were inclined to consider tuberculosis as of very great economic importance or dangerous to human health. Therefore very little progress was made in its eradication. As the Central and Western States became settled and cattle were moved westward the disease spread much more rapidly than is generall realized. The spreading in those areas is due, of course, to the fact that the live-stock industry occupies a more important part in agriculture than in the Eastern States. Cattle are traded in more extensively and are continually being shipped and trailed from State to State and from farm to farm.

In some localities in the West, where dairying has developed extensively, it is now known that carload lots of cows purchased in other States have contained 50 per cent. or more of tuberculous animals. Some herds of beef cattle in our western country have become contaminated with the disease by placing among them tuberculous pure-bred bulls and cows that come from diseased herds elsewhere. The importance of controlling tuberculosis and preventing its spread by the interstate movement of diseased animals was not so well recognized during the times of pioneer developmnet as it is today. Consequently in the absence of regulation and inspection, diseased animals moved from one State to another. The shipment of cattle from Eastern and Northern States to the South, with the exception of dairy herds near the larger cities did not commence until progress had been made in the eradication of the cattle tick. Therefore there is probably less tuberculosis among the herds of the Southern States than in any other part of the Nation. This favorable condition should be taken advantage of, for in all probability the livestock industry will reach a high development in that area in future years. It is especially important that the herds of the Southern States be protected by permitting only tuberculosis-free animals to enter.

Losses of Meat Food Products

Records kept by the Meat Inspection Division of the bureau show the great financial loss caused by tuberculosis every year. They also indicate how widespread tuberculosis in cattle and swine is in the United States, as the establishments in which the diseased animals were slaughtered are in all parts of the country. More than that, only about 65 per cent. of the cattle and swine, it is estimated, are slaughtered each year in establishments under Federal supervision, so that about35 per cent. of these classes of animals slaughtered each year in the United States do not appear in these records. It is known also that the percentage of tuberculosis is greater in the uninspected animals. In view of these points the losses shown in the following table are

(Continued from page 257)

HOW TO PROCEED TO MAKE CERTAIN THAT CATTLE AND SWINE ARE FREE FROM TUBERCULOSIS

Have a competent veterinarian apply the tuberculin test. Remove all reactors promptly, and disinfect the premises immediately after the removal of the reacting cattle.

Do not feed any infected dairy products to swine or young cattle.

Retest the herd with tuberculin once a year.

Maritime Stock Breeders in Convention

The annual meeting of the Maritime Stock Breeders' Association was held in the Agricultural College, Truro, N. S., on January 8th at 2.30 p. m.

Upwards of fifty representative stock breeders were present when A. E. Trites, President of the Association, called the convention to order.

The minutes of the last annual meeting and directors' meeting, and special meetings since held, were read by the Secretary, Fred L. Fuller, and approved.

The Financial Statement showed that the Association is in a flourishing condition with a surplus of $2350.00.

Mr. Fuller referred to live stock conditions in the Maritime Provinces, and the work accomplished by the Maritime Stock Breeders' Association in the way of bettering these conditions. He called special attention to the need for Maritime Stock yards, Abbatoirs and Cold Storage plants to give breeders and feeders of cattle, sheep and swine, sale facilities that are badly needed as under present conditions drovers and butchers have everything pretty much their own way, and consequently pay the producers just as little for the stock they purchase as they possibly can. Co-operation and competition in selilng stock is conducive to the best returns.

The Secretary instanced the cases of two men who had several head of cattle entered in the Block Test at Amherst, and who were unable to get an offer of only 16 cents per pound for the beef, the butchers taking advantage of the by-law "any exhibitor withdrawing an animal entered in the Block Test shall pay the following forfeit: For cattle, $5.00 per head; for sheep and swine, $2.00 per head." The butchers thinking that sooner than pay the forfeit, even if prices were low, the stockmen would send their cattle to the block. The management of the Fair on learning this, rescinded the by-law in question and when the butchers discovered that the cattle were being withdrawn from the Block Test, the prices went up by leaps and bounds to 24 cents per pound.

Buyers of lambs in Eastern Nova Scotia were offering as low as eight cents a pound until they come in contact with the competition of local co-operative lamb shipping associations, when they were compelled to increase their offer to ten and one-half cents per pound, in one week. Some co-operative shippers realized approximately twelve and one-half cents per pound net for their lambs on the Montreal market.

The matter of the establishment of an Abattoir in the Maritime Provinces was brought up by H. W. Redstone, of St. John, representing the Eastern Brokerage Co. He outlined the formation of a company, capitalized at one million dollars to build and conduct the proposed Abattoir. Plans prepared by eminent Chicago architects were submitted by the speaker. The location of the plant would be at some point in the Maritime Provinces to be selected by the Federal Government, and, failing that, by the stock holders of the corporation. The plans submitted would provide for a daily eight-hour capacity of from 100 to 150 cattle, 500 to 750 sheep, and from 1,000 to 1,500 hogs. The specifications are:

Killing building, four stories and basement, 112 x 122 feet.

Cooler building, four stories and basement, 102 x 112 feet.

Tank house, three stories and basement, 36 x 112 feet.

Fertilizer building, two stories and basement, 56 x 112 feet.

Engine room, three stories, comprising spray pond for cooling, ammonia.

Condensing deck and engine room proper on main floor, 64 x 64 feet.

Boiler room, one story 52 x 70 feet.

The president informed Mr. Redstone that the directors would make no more until they had another meeting with the Ottawa authorities early in February.

A motion to increase the number of directors allowed the Maritime Poultry and Pet Stock Association from one to three was defeated.

The next Winter Fair will be held on the week of December 13th, 1920. Stock breeders will do well to paste this date in their bonnets and the public will be well advised to visit Amherst at that time to see the display the Maritime Stock Breeders will make at that time.

President Trites, on behalf of the Maritime Stock Breeders' Association, presented Lloyd Bleach of Amherst with a purse of gold in recognition of his untiring assistance at the last Winter Fair.

We had heard a lot of criticism while attending the Fair, of delays and careless handling by the railways of stock in transit to the Winter Fair. We had also heard some very uncomplimentary remarks anet the same subject from men who had been inconvenienced on the homeward bound trip, rather more so than when Fair bound. Consequently we were not surprised when this subject was brought to the attention of the Maritime Stock Breeders' Convention.

The evidence adduced went to show that there had been flaglant delays, indifference, and carelessness in live stock transportation to and from the Fair.

Secretary Fuller had done his part to forestall inconveniences of this kind by getting in touch with Mr. Devenish, Superintendent of the Moncton Division of the C. N. R. apprising him of the number of cars of stock that would be moving from and to various points on certain dates. Mr. Devenish in turn had issued orders to his men, that had they been carried out would have kept every exhibitor in a happy mood, but the best laid plans of mice and men gang aft aglee. Jack Frost was playing havoc that week with railroading operations and some of the orders issued by Mr. Devenish could not be carried out in some cases, and in other cases would not be carried into effect by the train crews.

Mr. Devenish heard all the complaints and will undoubtedly have something to say to the crews that failed to comply with his instructions. He also assured the Stock Breeders that he would be on hand to superintend transportation matters at the next Winter Fair, and that everything possible would be done to prevent a recurrance of a necessity for complaints.

The following resolution was passed unanimously:

"Whereas exhibitors at our Maritime shows have defeatedly suffered loss and inconvenience, due to negligence and indifference of officials and employees of the railway; and

"Whereas they have repeatedly fallen down on promises and assurances given owners; and

"Whereas breeders of valuable high-class stock cannot afford further the risk and danger of injury and damage occasioned by such treatment;

"Therefore esolved that we, the members of the Maritime Stock Breeders' Association, now assembled in annual session, protest emphatically against such treatment; and

"Further Resolved that unless we have a guarantee against all financial loss and injury, due to such mismanagement we will appeal to the press, the public and allied farmers' associations to assist in securing justice."

Mr. S. A. Logan referred to some of the difficulties that confront the Maritime stock breeders. He said: "For instance, a man living in Berwick, N. S., sells a two-year-old bull at Glendyer, on the Inverness railway. The actual weight of this dairy bull is 700 pounds or less. He is billed at 4000 pounds, and at a half rate, as he is pure bred. The actual freight charged is $9.30 to Truro, $10.90 from Truro to Point Tupper, and $11.00 from Point Tupper to Glendyer, if shipped at the owner's risk, and $22.00 if carried at the railway's risk. In addition to this there is a lay-over at Windsor, another at Truro, and one at Point Tupper, with charges of at least $1 at each place for feed and water, making a total of $34.20, taking all the risk and shipping at the cheapest possible rate, or $45.20 when shipped at the railway risk.

"I asked for a freight rate recently on a lamb from Amherst to River Hebert on the Joggins railway," Mr. Logan went on, "and found that it was billed at 400 pounds, when it actually weighed less than 100 pounds, and the freight to Maccan (the junction point, and about half way) was 96 cents, if carried at the railway's risk. I did not enquire the rate on the Joggins road, but it would be as much more, at least. However, the express company carried the lamb all the way to River Hebert for 60 cents."

Mr. Logan then referred to the freight rate on ground or pulverized limestone, which he said was the same as on commercial fertilizer. "It cost from four to five dollars at the quarry, and if carried a few hundred miles, the freight was more than the cost." He added: "Railway companies in the United States have recognized the value of this limestone as a soil improver, and as soil improved means more business for the road, have made a special low rate on it. I merely refer to this, as ew have some railway officials with us, and we may take up these matters at some other time."

W. W. Hubbard said railroad men seemed to take delight in annoying the shippers. This is seldom or never done at points where two roads serve the public.

Hon. W. M. Lea said he knew of cases where train hands had failed to give valuable animals any consideration. They were shunted and jerked about at junction points. He had seen cars of live stock handled in this way so roughly that rings were torn out of the bulls noses. It was an almost hopeless situation he said, to be on the road with a load of live stock and no railway employees willing to give assistance or even decent courtesy.

Mr. James Roper told of an instance where he had taught an insolent railway employee better manners by grasping the insolent one by the neck and squeezing just hard enough to elect the promise of more courteous consideration in future of stockmen, and their stock.

Mr. Devenish replied that it was hard for railway officials to know what was going on at isolated points, where one man could, through careless tactics and an insolent disposition to the public, make a lot of enemies for the road. He was glad to have the frank criticisms of the stock breeders, and would be glad to co-operate with the association in every way possible to bring about the seemingly needed redress.

The election of officers resulted as follows:—Directors,

New Brunswick—Percy Fairweather, Rothesay; W. S. Harding, Hammond River; Angus Avard, Sackville, and W. W. Hubbard, Fredericton.

Prince Edward Island—J. M. Laird, Kelvin Grove; W. H. McGregor, Lot Sixteen; James Roper, Charlottetown; Edward Reed, Rollo Bay.

Nova Scotia—Prescott Blanchard, Truro; W. W. Black, Amherst; S. A. Logan, Amherst and J. O'Brien, Windsor Forks.

Director representing the Maritime Poultry Association—John R. MacMullen, Truro.

At a subsequent meeting of the directors, A. E. Trites, Salisbury, N. B., was re-elected president and Fred L. Fuller, Truro, N. S., was re-elected Secretary.

It was also decided to retain the Association's membership in the Eastern Live Stock Union and not hold a horse show this year.

At the public meeting held in the evening of the Convention day, films were shown and addresses were made by Hon. W. M. Lea, Minister of Agriculture for Prince Edward Island, on the Management of the Dairy Herd. Prof. John M. Trueman discussed the problems of stock breeders and urged the use of better sires and the elimination of scrub animals. The importance of an increased acreage of roughage to provide cheap food for stock was pointed out as the only solution of the question of making the dairy herd pay when mill feeds are so high.

Gleanings From N. S. Agr. College

BIG POTATO CROPS

The average yield of potatoes per acre for Canada in 1919 was 160.75 bushels. The average yield of crops grown by four farmers in the neighbourhood of Bridgewater, Lunenburg Co., N. S., was 475 bushels of excellent quality. This is no freak yield either, for these men have been growing equally heavy crops in previous years.

The four men whose potato crops form the basis of this story were the prize winners in the Fields Crops Competitions in the Western end of the Province. They are Messrs. Henry Newcombe, Newcombviee; Scott Hebb, Hebbville; ames Mader, Pine Grove; and Albert C. Veniotte of West Northfield.

The results obtained by these farmers point the way to greatly increased yields all over the Province, for the natural conditions are in no important respect different from those obtaining in any of our good farming sections. When one puts it down in cold figures, the difference in yield between the average field and these four is enough to stir the interest of any ambitious farmer. A fairly careful calculation of the cost in labour and materials over and above the cost of the average fields sets it down at $50.00 per acre. That is, the acre which yielded 475 bushels cost $50.00 more than the acre yielding 160 bushels. With potatoes at $1.00 per bus., these men got an extra return of $315.00 for an extra outlay of $50.00 for fertilizer and labour—over 600%. It beats black foxes out of sight, even when these animals were selling at $10,000 a pair.

The whole story of the potato growing practice of these men yields three main points.

1. The soil should be put into garden like condition before planting. An extra harrowing or two will pay handsomely.

2. It was proven that the addition of commercial fertilizer to the barnyard manure gave a generous return, even when it contained only nitrogen and phosphoric acid, and no potash.

3. Each of these men sprayed five times during the season, beginning early in July, when the plants were

about four inches high, and continuing until the end of August.

It is evident that Nova Scotia in this line can equal any other Province in the Dominion, perhaps any section of the Continent. What is necessary is the following up on the part of hundreds of other farmers of such methods as are indicated here.

A SUCCESSFUL SHORT COURSE

The Short Course held at the College January 6th to 16th of this year, was an extremely successful one, much more so than was anticipated by the staff when it was first proposed. Some doubts were expressed as to the wisdom of holding a Short Course this year on account of the scarcity of help on the farms, high transportation rates and still higher boarding rates.

It was decided in the end to make a change in the arrangement of the course. The first four days were filled with a self-contained programme so as to be complete in itself, then a continuation course was arranged for such as could remain longer to last six additional days. Thus, busy men who could not long be absent had an opportunity of hearing lectures and seeing demonstrations on up-to-date farming and stock-raising practice.

There were 146 regular students in attendance during the first four days and an additional class of 47 soldiers. Of this number the soldiers class remain for the continuation class and about 30 of the other students. No more successful Short Course has been held in the history of the College, and the plan of dividing the period in two parts will probably be followed in future years.

Apart from the usual instruction in the breeding and care of live-stock, crops, horticulture, veterinary science, etc., much interest was added by the exhibition of motion pictures depicting Agricultural processes. Some of the films shown are owned by the College, some were loaned by the Ontario Department of Agriculture and some by Mr. George E. Graham, General Manager of the D. A. R.

In this connection it is worth noting that the D. A. Railway, under the aggressive management of Mr. Graham, has purchased special cinematograph machines specially adapted for Agricultural operations, and is arranging for their use along the railway lines. This is a most commendable enterprise from an educational standpoint, and is capable of almost unlimited development.

N. S. POULTRY ASSOCIATION

Not many years ago about the only fuss the hen could raise was her cackle over her fresh laid egg, and it was not worth fussing over from the point of view of market value. Times have changed. With fresh eggs retailing in our cities at $1.00 per doz., and dressed poultry at proportionately high prices, the humble hen is coming into her own.

A keen and growing interest is evident all over the Province in poultry matters. The Annual meeting of the N. S. Poultry Association was held at the College, January 13th. Among all the meetings which were associated with the Short Course, this one ranked well up. Some twenty five delegates were in attendance, with President H. H. Hull of Glace Bay in the chair, and Mr. J. P. Landry, Superintendent of the Poultry Division for Nova Scotia, acting as secretary. A fuller account of the proceedings will appear in these columns at a later date.

N. S. A. C. NOTES

Eleven graduates of the Nova Scotia College of Agriculture, of whom six were in Khaki during the war, are this year enrolled in the third year at the Ontario Agricultural College. Their standing in the Christmas examinations at Guelph have just been announced and are very creditable both to themselves and to the College at Truro. Out of a class of ninety-three, who wrote the examinations, the Nova Scotia boys stood as follows: F. L. Wood, Carters Point, N. B., 3rd; R. M. Lewis, Yarmouth, N. S., 4th; H. L. Trueman, Truro, N S.; 6th. The others fall in line 27th, 31st, 37th, 41st, 53rd, 64th and 81st.

A NUT FOR SOME ONE TO CRACK

From time to time the public of Canada have been kept informed of the movements and enquiries held by Mr. W. F. O'Conner, enquiries quite often centering about the question whether milk should be 13c or 14c per quart in a given city. This is all well and good, but the writer, and doubtless other poor and humble consumers have often wondered why the enquiry should not be on the question whether meat should be retailed at 25c or 45c per lb. The milk issue is one involving only from one to three cents per day to the average family at most, while the meat matter may well involve ten times as much money.

An interesting side light on the meat situation was brought out at the Winter Fair. The highest offer made by local meat dealers for the animals slaughtered in the block tests, choice dressed beef, was 16c per lb. A Montreal buyer on the ground purchased the carcasses at 24c. Yet beef in Nova Scotia generally retails at higher figures than in Montreal. By the way, last week's quotations on the Toronto market for butchers' steers, good to choice, ran from $9.50 to $11.50 per hundred, live weight, which is equal to about $19.00 to $23.00 dressed weight. For heavy steers the prices ran about $3.00 per hundred higher, dressed weight.

It would seem that the farmers in the vicinity of Montreal and Toronto get higher prices for their products in this line, while the consumer actually buys at a lower figure than here. In view of the whole situation it is no wonder that there is a constantly growing demand for a central abbatoir and cold storage plant, which would tend to stabilize prices and improve matters for both producer and consumer.

STORAGE OF ICE

Where the materials are available it is a very simple matter to store enough ice to provide a great deal of comfort and convenience during the summer months. An enclosure 10 feet square and eight feet high will hold enough to last 130 days, using 50 lbs. per day, and allowing for a reasonable amount of wastage. The smaller the quantity stored the larger the proportion of waste.

Any unoccupied corner of a shed will answer the purpose, and the roughest lumber lying about is good enough. The bottom of the enclosure should be covered with about a foot of sawdust. If the soil underneath is clayey, a few inches of gravel below the sawdust will be an improvement. A space of a foot should be left between the ice and the boards to be filled with sawdust, and the ice should be covered with an equal depth. The drier the sawdust is the better the ice will keep. The ice should be cut in blocks so as to pack as tightly as possible.

If it is necessary to erect a special ice house, the roughest kind of a shed that will keep out the weather is all that is necessary. Poles may be driven into the ground and lined up on the inside with rough boards or slabs, leaving a half inch of space between them, and the whole covered over with a roof to keep out the rain. There should be abundant ventilation above the ice.

If sawdust cannot be obtained, shavings may be used, or even hay as a packing material. Marsh hay, or any fine wild hay is best. If hay is used, the space around the walls, and the covering over the top should be two feet instead of one foot in depth.

DR. JAS. W. ROBERTSON TO VISIT NOVA SCOTIA

A communication recently received by the Secretary for Agriculture from Dr. Jas. W. Robertson, Dominion Commissioner of Agriculture, indicates that Nova Scotia is to have a ten days' visit from him, Feb. 17th to 26th. Two or three dates within this period have already been arranged for, but the Secretary is anxious to have as large a number of Nova Scotia farmers as possible to take advantage of this visit. Dr. Robertson has been in France at the Peace Conference as Canadian Agricultural representative, and comes with fresh first-hand information on th world's food situation. No man is better qualified to advise with regard to food production and agricultural trade than Dr. Robertson. Organizations or communities, wishing to hear Dr. Robertson should communicate as soon as possible with the Secretary of Agriculture who is arranging his itinerary.

CLASS REUNION

The class of 1915 held a reunion at the time of the College Short Course, on Friday, Jan. 9th. The event was celebrated by a banquet at the Stanley Hotel, Truro. This class, which entered the senior year three months after the war broke out, enrolled thirty three members. An additional five were members of the class in its junior year. Twenty-one enlisted, and of these five laid down their lives in the great cause, viz., Jack Woodroofe, Dartmouth; eGorge O'Neil, Searsville, N. B.; J. H. MacIvor, Baddeck, C. B.; Fred M. MacKenzie, Nerepis Sta., N. B.; and J. Stanley Sutton, Nappan, N. S.

Nine of the class were present at the banquet and had a most enjoyable time. Officers were elected as follows: Hon. Pres. Professor Smith; Pres., Errol Notting; Secretary, Eldon Taylor. It was decided to hold another reunion five years hence.

"So long as I am Minister of Agriculture there need be no fear about the Guelph show, for it will be carried on as usual," was the emphatic statement of Hon. Manning Doherty, Ontario's new Minister of Agriculture, at the first of the director's luncheons held on Monday last. He made it plain that the Guelph Winter Fair must be maintained as a feeder for the proposed Royal International Show at Toronto, and also touched upon the importance of the live stock industry in Canada. In dealing with the proposed methods of improving Ontario's live stock, he asked for the co-operation of all in the campaign to eliminate the scrub bull.

BRAND

Pure Wool Underwear

O.V. (Ottawa Valley) brand has been worn for fifteen years by Canada's nation builders—on railroads, farms and the Empire's battlefields; in mines and in construction camps. Made for warmth and durability, in medium and heavy weights, in combinations and two piece suits. Guarantee with every garment. Moderate prices.

Sold throughout the wholesale trade only.

THE MARITIME FARMER

And Co-operative Dairyman
Registered Trade Mark
Fortnightly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers and Dairymen's Association of New Brunswick; The Nova Scotia Farmer's Association; The Nova Scotia and P. E. I. Fruit Growers' Associations; The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers' Association; The New Brunswick Poultry Association, and the Newfoundland Agricultural Board.

Subscription price $1.00 per year. This paper is sent to subscribers unless a definite order for discontinuance is given,

The date after your name on the little green label on front page, is in every case the time to which your subscription is paid.

OUR GUARANTEE—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser he said:—"I saw" your adv. in the MARITIME FARMER.

JANUARY 20, 1920.

COWS THAT CAN MAKE GOOD RECORDS

The farmer of moderate means can use an ordinary herd of cows as a part of the foundatios of a splendid grade herd if he selects a good sire of either one of the great dairy breeds. He can secure one or two heifers of the breed of his choice for a moderate outlay of money and gradually as time goes on he can sell his grade cows to his less fortunate neighbors and fill their places with pure-bred animals grown on his own farm. In time and by he will find himself with a purebred herd and it will have cost him no large amount of money at any particular time. Such a course and such results are within the reach of most farmers throughout the country.

The cow must be in proper condition to go through the work of making a good production record, whether for seven days, thirty days, ninety days or one year. Few breeders of dairy cattle realize what condition means in making a great production record. It is often the extra few pounds of flesh and reserve energy that means the breaking of a world's record for milk and butterfat production and places some breeder on the highest pinnacle of fame. It is difficult to define exactly just how to put on this extra flesh and bring the cow safely through her calving period, but it is seen only when cows begin their official tests as vigorous and well-fleshed as skillful feeding can make them. Condition, as meaning capable of maximum production, is necessary before a phenomenal record can be obtained.

KILL THE PESTS AND SAVE THE CROP

Systematic effort to destroy weeds, grain diseases and insect pests result in the saving of hundreds of bushels of grain. Seed treatment for smut in oats, potatoes for scab and blight, crop rotation, frequent cultivation, the use of cleaned and tested seeds, free from weeds, orchard pruning and spraying, are general methods adopted for the control of all pests.

SET WET LAND TO WORK

In the Maritime Provinces there are thousands of acres of land that is just dry enough to tempt the farmer to cultivate it, but just wet enough to prevent the growth of a crop. Farmers who have ditched areas of this kind find that the major portion of crops subsequently grown on such areas can be considered as net profit; twice in former years such land was generally cultivated without any adequate return on account of poor drainage.

DAIRYMAN'S CREED

"A pure-bred dairy bull at the head of the herd. Disposal of all 'slackers' in the herd. Feeding the cows so as to secure the highest possible production and net returns from the herd."

Whatever else is done in the way of a beginning with pure breds, start with a good bull, a really good bull—the best available. The bull really builds the herd; the owner merely directs —inheritance is largely a matter of chance, and to become a successful breeder, one must eliminate, so far as lies in his power, the undesirable chances by the use of animals pure bred for many consecutive generations.

MUST HAVE CULTIVATION

The mind of the farmer, like his soil, must have cultivation if there is to be an ample harvest. Those who neglect culture and refinement cannot enjoy wealth and leisure if these are acquired. Life is not worth living without an appreciation of the true and beautiful in life.

AS TO RPODUCTION

We know that the 44-hour week cannot feed the world and we proclaim that it cannot clothe it —this resolution was passed recently by the Farmers' National Congress of the United States.

THE MODERN "RUBE"

"Say, Cy, I jest found out what a 'Rube' is."

"Thet so, Hiram? What is it?"

"Why, it's one o' them forty-one-hour, ninety-five-dollar a week labor guys that thinks a farmer is goin' to sell him food cheap."

Hon. Dr. Tolmie, speaking at Guelph Winter Fair, declared that "any farmer who gets up at four or five o'clock every morning to milk his cows, who attends to them seven days in the week and who has all the expense of putting his product on the market under prevailing conditions, is entitled to every cent he can get for milk in this country." He advocated the breeding of better cattle in Canada, and dwelt at some length upon the unprofitable 4,000-pound cow and their prevalence in this country. "The man who looks after them has nothing for his labor and there are too few 30,000-pound cows in Canada."

Dollars, though very necessary, are not the sole object in life. There are other things which add more to life than the mere possession of money. One of these is an attractive home; and that includes the home grounds.

Fortunately there is now a greater interest taken everywhere in the beautifying of the home grounds than in the past. There is a realization afloat that none can afford to have bare and ugly surroundings. Trees, shrubs and flowers planted appropriately about the farmstead not only add to the cash value of the farm, but also give comfort, beauty and pleasure to those who make it their home.

During these cold blustery days, when it is disagreeable working outside, the time can be very profitably spent in the barn cleaning the seed grains for the next season's planting. Oats, barley, clover seed, etc., will give better stands if run through the fanning mill and the light chaffy seed kernels, bits of straw, dirt and weed seeds removed. The large plump seeds germinate more evenly and make stronger, more vigorous plants. Farm production will need to proceed at high speed next spring, so prepare for it now.

Speaking at the Guelph Winter Fair, Hon. Manning Doherty, Minister of Agriculture for Ontario, asked for the co-operation of all interested ni the proposed methods of improving live stock in Ontario, in the campaign for the elimination of the scrub bull. Every right thinking citizen will stand behind any government that will legislate the scrub bull off the roads and commons of their province.

Clover is a good crop to grow, because of its feeding value. No other plant will take the place of clover as an all-round stock feed. The greatest value derived from clover, however, is the fertility which it furnishes to the soil.

No-lingering-along-in-the-woods these days for the man or woman who has decided to buy a foundation herd. The time is ripe to mobilize some purebred cattle and "get goin'."

The better the herd of dairy cows kept, the greater will be the return from this source. This is an inducement to invest in pure-bred stock.

Every normal person is born with a message for humanity, with a sacred obligation to give his best to the world.

Paper horses flourished like the green bay tree 30 years ago, but the lesson was well learned and there is small danger of a recurrence. The animal first and then as much of good blood as can be had.

Good fences are no longer a fad, but a necessity and of the kind that is imperative. If you look at the matter sanely, no matter from what angle, you cannot help but reach this conclusion.

There is a great cry just now for cheaper food, but such is impossible unless cheaper wages follow. The one must follow the other as sure as fate, and it is not of much importance which comes first.

If the average farmer would figure the cost of producing his crops as closely as the manufacturer figures his, he would be surprised, no doubt, at the small margin of profit which he has, and this in turn would lead to a more effective argument for his right to higher selling prices.

Sometimes farmers cannot prevent outbreaks of live-stock diseases on their farms, but they can and should ayways use every preventive measure and see that proper precautions are taken when the disease first makes its appearance.

TUBERCULOSIS IN LIVE STOCK—DETECTION, CONTROL AND ERADICATION

(Continued on page 261)

believed to be scarcely one-half of the total los sthroughout the country.

When animals are "retained" by the Federal inspectors on account of tuberculosis it means that some evidence of the disease is discovered and the carcass is placed aside for further examination. If the disease is found to be so slight as to render the undiseased portion of the carcass fit for food, the diseased area is removed and the remainder is passed. It will be noted that such is the case in most carcasses retained, but some loss occurs for the reason that the diseased portions found unfit for food would have a considerable value if healthy.

In the animals that are retained and when the disease is not extensive enough to cause condemnation of the entire carcass, the disease is in most cases in the early stages. Had the animals been allowed to live for possibly only a short time longer, the disease would have progressed until all the carcass would have to be considered diseased. In others the lesion of disease has become surrounded by tissues that "locks it up" and prevents it from spreading to other parts of the body. Such a condition, however, is liable to change at any time during the animal's life and allow the disease to enter other parts of the body, and also to be carried out of the body and endanger healthy cattle and swine.

On the farms from which these animals came, some of the remaining cattle and swine are probably acected with tuberculosis, or will be if allowed to remain there for a sufficient length of time. Knowing this danger, State and Federal officials, when the identity of the animals can be established, trace back as many of the shipments of diseased animals as possible and through the co-operation of the owner try to exterminate the disease rfom that farm.

Cause of Tuberculosis

The direct and primary cause of tuberculosis is a rod-shaped germ which can be seen only with the aid of a microscope of high magnifying power. The presence of this germ in the bodies of human beings or live stock is absolutely necessary to produce the disease. The germs of tuberculosis may also be grown artificially in proper material at a temperature of about 98° F.

Outside the bodies of animals the organism is not capable of reproducing itself. When exposed to the direct rays of the sun it dies quickly—a fact to be noted in the disinfection of pastures, paddocks and barn lofts. The organism may live for months, however, when it is protected by dry manure and other materials which form a crust over it and prevent its destruction by the sun's rays. It is of extreme importance, therefore, to clean and disinfect thoroughly all barns, stalls. and other inclosures which contained tuberculous animals before healthy ones are again placed in them.

While it is necessary for the germs of tuberculosis to be introduced into the body of the animal before the disease can be produced, there are many conditions or accessory causes which make animals fall victims to tbuerculosis.

Animals which are fed on nonutritious feeds, as well as those that have too little feed, become weakened constitutionally and lose the power to resist the invasion of the organisms. Stabling animals in dark, poorly ventilated, and dirty barns helps to spread tuberculosis among the stock whenever the germs are present. Introducing a tuberculous animal is almost sure to give the disease to healthy animals in a short time. If the heatlhy animals drink water from the same trough or bucket the tuberculous animal uses, and if that animal is coughing up tuberculous sputum, all the animasl are in serious danger of infection. Any condition that produces constant strain upon the systems of animals, such as the continued forced lactation periods of dairy cows, renders them fit subjects for the development of tuberculosis.

How Cattle Become Infected with Tuberculosis

The tuberculous cow is the greatest source of danger to healthy cattle, and inasmuch as it can not be determined just when that animal becomes a "spreader" of the germs, unless daily microscopic tests are made of the discharges from the body, and the milk is also examined microscopically it is unsafe to keep it with healthy cattle. No cattle from outside sources should be introduced into a healthy herd until they have been tuberculin tested and found free from the disease. Unquestionably more healthy cattle acquire tuberculosis by coming into contact with affected animals than in any other way. It has been observed frequently that cattle which stand on either side of or face tuberculous animals in barns are the first to contract the disease.

The continuous water trough in barns is also accountable to a very large extent for spreading the disease. Cattle may become infected by picking over manure infected with the germs of tuberculosis. Hay, straw, or any other feed contaminated with the germs may give the disease to animals that consume such material.

Water holes and creeks into which infected milk or the washings from infected milk cans have been dumped may also be a source of the infection. The teat siphon or milking tube, in a number of instances, has been the medium by which the disease has been conveyed from one animal to another. Calves contract tuberculosis by nursing, even for a short time, cows whose udders are affected. Calves also become infected frequently by drinking milk from diseased cattle isolated from the main herd. To be safe for feed, milk from such cows should first be heated to a temperature of 145° F. and held there for at least 30 minutes, but as this method requires considerable attention to assure proper heating, boiling for a few minutes is considered a better plan.

How Swine May Become Infected

The tuberculous cow is not only a menace to other cattle but is also the commonest source of infection to swine. In some parts of the country especially where there are whole-milk creameries and skimming stations, feeding mixed skim milk to swine is a common practice. In that way the skim milk from one farm may be fed to hoge on another. Thus it is possible that milk from a fe wtuberculous cows may set up the infection among swine on many farms.

Milk is a good medium for the development of the tubercle bacilli, and swine seem to be extremely susceptible to tuberculosis. Numerous instances are on record, also, in which the whole milk is seaprated on the farm, the cream shipped, and the skim milk fed to swine. Consequently one tuberculous animal that is passing the germs in the milk secretions may give the disease to any or all of tme animals to which any of the milk is fed.

As the disease often involves the lymphatic glands in various parts of the body, an examination of such glands as can be felt in the living animal is sometimes helpful in diagnosing the disease. The glands of the throat, udder, and point of the shoulder often present an abnormal condition, such as an enlargement or hardening. Animals affected often show a "staring" coat and a generally unthrifty condition. When the throat glands of an animal are affected, it often holds its head in an abnormal position in order to relieve the pressure which causes difficult breathing. Increased respiration is often noted when the lungs or lymphatic glands of the thoracic cavity are affected. When some of the glands of that cavity are extensively diseased, the animal often develops bloat. Diarrhoea is often evident in some cases in which infection has extended to the abodminal cavity. The symptoms mentioned, though typical, must not always be expected when animals are tuberculous animals that are extensively riseased are often in apparently perfect physical condition.

Methods of Diagnosis

Microscopic examinations of sputum, milk, and bowel discharges of an animal are sometimes made to determine the presence of tubercle bacilli and to diagnose tuberculosis, but after many years of experience the tuberculin test is now considered to be the most practicable and satisfactory way of discovering the disease in the living animal. The inoculation of guinea pigs with emulsions made from milk or discharges from living animals is sometimes resorted to as a means of diagnosis, but that method of examination is technical and requires special scientific training and equipment. Besides, cases of tuberculoss may be overlooked when laboratory methods are used because tuberculous animals do not always discharge the tubercle bacilli.

The Tuberculin Test

Testing animals with tuberculin is the process of introducing tuberculin into the animal and interpreting results accorting to well known standards. Tuberculin is a laboratory product prepared scientifically and, when of standard potentcy and in the hands of skillful persons, it is a reliable agent for detecting tuberculosis in animals. It contains no living tubercle bacillit but is a product of the growth of tubercle bacilli properly mixed with a substance on which it has grown and properly diluted and preserved. No harm can result to healthy animals from the proper application of tuberculin even if doses many times greater than the regular ones are used.

The use of tuberculin by untrained persons is to be discouraged for the reason that in mnay cases its effect on tuberculous animals is unobserved and not understood by those unfamiliar with its action. Tuberculin, by its immunizing property, can cause tuberculosis animals to fail to respond to its application at another time; therefore it may be misused by unscrupulous persons.

The Subcutaneous Test (Under the Skin)

The most frequently used method of testing is the subcutaneous test, which consists in injecting the proper quantity of tuberculin underneath the skin nito the subcutaneous tissue. If an animal is tuberulous, the action of the tuberculin causes a fever, which is indicated by a rise in temperature. This rise, under ordinary conditions, may occur any time between the eighth and twentieth hours after the tuberculin is injected, but in some cases it is desirable to measure the temperature before the eighth hour and continue to the twenty-fourth hour or longer.

The temperatures are measured at least 3 times in advance of the injection, at 2-hour intervals, to learn whether the animal is in proper condition to receive the test. The temperatures after injection are taken every 2 hours until the test is completed. The proper interpretation of the temperatures is made by the person applying the test, and a careful observance of any clinical changes is always important in determining theresult. It can not be set forth too strongly that the test including the two following methods, should be attepmted only by those who are properly qualified to do the work.

(Continued in the next issue)

* Covers 9 months from October 1, 1906, to June 30, 1907.

J. M. Evvard, head of the Swine Experimental work at Ames, Iowa, has conducted some of the most extensive and practical hog experiments in the country. Some of his recent practical suggestions regarding fall pigs are as follows:

Feed both sow and litter well from the start to build flesh for winter.

Give plenty of good water and warm it in the winter time.

Keep fall pigs in warm, ventilated house.

Keep houses well bedded. This means bedding must be changed fairly often.

Place self-feeders within house so pigs will not have to go out in the cold to eat.

Confine pigs in small quarters and do not allow them to run over the farm.

Keep pigs free from lice, mange, and worms. Crude oil is good to prevent mange and kill lice. Santonin will get the worms. Give constant and careful attention to pigs.

Here's the Evaporator to Solve the Syrup and Sugar Problem

Thousands of grove owners do not work their groves for very little reason. Lots of them just can't make up their minds. Yet if we were to put a proper outfit in their grove and they saw it work so easily and the money there was in it—for one season—they would fight to prevent us taking the outfit away again, even if the cost were a good deal more. An unworked grove these days is like an untapped reservoir with thirsty people around. A big demand and no supply. Why not put a

GRIMM CHAMPION OUTFIT

in your grove. One of a right size to work your bush to full capacity. Then there will be no waste and every dollar extra means more production. We can fit out any grove from sap spout to Champion Evaporator. Get in touch with us right away.

MARITIME SEED GROWERS IN ANNUAL CONVENTION

The Annual Convention of members of the Canadian Seed Growers Association, resident in the Maritime Provinces, was held in the lecture room of the Winter Fair Building, Amherst, N. S., on Tuesday, December 16th.

Dr. M. Cumming, of the N. S. A. C. presided, who, on calling the meeting to order, emphasized the importance of good seed in growing maximum crops and the relationship that maximum crops bears to the promotion of live stock breeding. It behooves every stock breeder to improve their seed by selection, and get better returns in crops. In turn the larger yields will enable stock men to feed their stock more liberally and increase their holdings. Good results cannot be expected from seed chosen in a haphazard way. Every stock man should therefore be interested in seed selection. So essential is good seed to stock raising that the latter cannot be considered without due attention being paid to the former.

Progressive stock men feed, weed and breed, and of these three, feed is the most important consideration.

To carry on this function, the breeding of good seed should be featured by all farmers who would be progressive.

In closing, Dr. Cumming expressed the sentiments of his audience when he referred to Mr. Donald Innis, the veteran seed grower, who was to have addressed the meeting on "What Fifteen Years of Seed Selection in the C. S. G. A. has Taught Me." Dr. Cumming regretted Mr. Innis' unability to be present, as he felt the veteran had some inspiring ideas for the younger growers.

Mr. Walter Shaw of the P. E. Island Department of Agriculture, to the subject of "Some Observations on the Value of Systematic Seed Selection in Prince Edward Island", said this phase of the work was rather neglected during the war period. Field Crops Competitions are encouraging the Island farmers to produce a better class of seeds. The competitions are usually keen. He did not think the Seed Fairs were accomplishing the purposes for which they were inaugurated, as well as their progenitors would like. The Island Seed Growers' Association members feel that the time has arrived when they should have a seed grain elevator at some central point where good seed could be assembled and graded properly for the market.

He had noticed that the farmers who are the best seed selectors are the men whose grain, as a rule, scores the highest in the Field Crops Competitions. Their fields are usually more uniform in appearance. Island farmers have done well in the past; they are not goisg to stand still in the future, but will adopt any improved seed and methods that will tend to give them better yields and added prosperity.

Mr. E. P. Bradt, New Brunswick's Secretary for Agriculture, speaking to the subject of "Opportunities Open to Special Seed Growers in New Brunswick", said the subject of seed selection was not given as much attention on the average farm as its importance warrants. It is absolutely necessary use the very best seed obtainable if the maximum yields would result. The best seed to use is seed, properly selected, from the home grown crops. Like begets like in seed, as in live stock. "If we sow sparingly, we shall reap sparingly" is an old adage, and coupled with it we may truthfully say it is next to folly to expect a full crop from shrunken, broken, weedy seed.

A census of the kinds of seed used on the farms of Canada revealed the astonishing conditions, that a large percentage of the farmers did not know the names of the varieties they were growing, and little or no attention was paid to selection, either in the field or by the fanning mill process. In many cases seed is drawn direct from the bin from which the farm teams have been fed all winter. Few men in New Brunswick make any attempt to grow seed for the trade, yet there are within the province, many opportunities for the creation of splendid seed growing centres, particularly along seed potato growing lines. Some districts have a reputation of being practically free from disease. The farmers of these districts have here an asset that they should zealously guard to protect and maintain.

In regard to seed for Field Crops Competitions, Mr. Bradt said there was not enough registered seed in the province, or procurable elsewhere, to go around, and the only scheme that can be put into effect for the time being, is to use only seed from high scoring fields.

Mr. S. J. Moore, Maritime Representative of the Seed Division, spoke briefly to the subject, "What Well Bred Seed Means and How its Use May be Made More General."

The biggest problem was to overcome the indifference that is too often found in regard to the farmer's own best interests. It pays handsomely to use the best seed available, and a better class of seed than is commonly used is available through systematic seed selection.

The Seed Contest Act is quite generally observed in the matter of the smaller seeds. In cereals there was more latitude than the small seed classes, but now that there has been

Eureka Potato Planter
Pays for Itself in Labor and Time Saved
One man and team with an Eureka Potato Planter needs no hired help to plant the whole crop. Whether you plant 4 acres or 400, the Eureka Planter will pay for itself many times over. Better than hand planting. Increases yield. Does 5 operations at once, automatically—accurately.
Opens furrow, drops seed any distance and depth, drops fertilizer (if desired), covers up and marks next row. Furrow opens and seed drops in plain sight—an equal distance apart, at uniform depth, with absolutely no injury to seed. Easy to operate in any soil, made of steel and malleable iron—assuring long life, light weight and few or no repairs.
Write for free catalog on this great line of potato planters—the largest line made. Sizes for 1 or 2 rows, with or without fertilizer attachment. In Stock Near You. A success for over 20 years. Whether you are a large or small grower—write today.

SYDNEY BASIC SLAG

We are glad to inform the Farmers of New Brunswick that after being shut down for two months for want of raw material, our mills are again running day and night, and that full supplies of Basic Slag will be available for next season. In order to make for still greater efficacy we have increased the fineness of our product from 80% to 85%. This is the highest standard the world has ever known. We want reliable agents in districts where we are not already represented and all applications should be addressed to our

a change, whereby a stricter contest may be had of the Cereals offered for sale as seed, btter results may be looked for.

Seed Grade Standards for Wheat, Oats, Barley and Rye

Extra No. 1 Seed Wheat, Seed Oats, Seed Barley or Seed Rye, shall consist of correctly named and approved variety, shall be practically free from other varieties, shall contain not more than 50 kernels per pound of other grain, including black or brown domestic oats in white or golden varieties of oats, shall lie free from noxious weed seeds, shall be well cleaned and graded to remove light and small kernels, common weed seeds and other foreign matter; shall be sound and of good color; shall weigh not less than two pounds per measured bushel more than the standard weight for grain of the kind and shall be capable of germinating at least 90 per cent

No. 1 Seed shall consist of at least 95 per cent of one variety or type distinguishable from an examination of the threshed grain; shall be reasonably free from other kinds of grain; shall be free from noxious weed seeds within the meaning of the said Act; shall be well cleaned and graded to remove light and small kernels, common weed seeds and other foreign matter; shall be sound and of good colour; shall weigh not less than the standard weight per measured bushel of grain of the kind and shall be capable of germinating at least 80 per cent.

No. 2 Seed Oats and Seed Barley shall be the same as No. 1 in all respects except that it may contain slightly more foreign matter than is permitted in Grade No. 1, but not including any excess of noxious weed seeds, excepting Wild Oats, which may be tolerated in a proportion not exceeding ten in one pound of grain.

"The Value of Selection in Improving Potato Yields", was the subject of an excellent paper prepared and read by Mr. James Bremner, Agricultural Representative at Chatham, N. B. We will publish Mr. Bremner's paper in a future issue.

Mr. L. H. Newman, Secretary of the Canadian Seed Growers' Association, spoke on the subject of "Production and Handilng of Registered Seed."

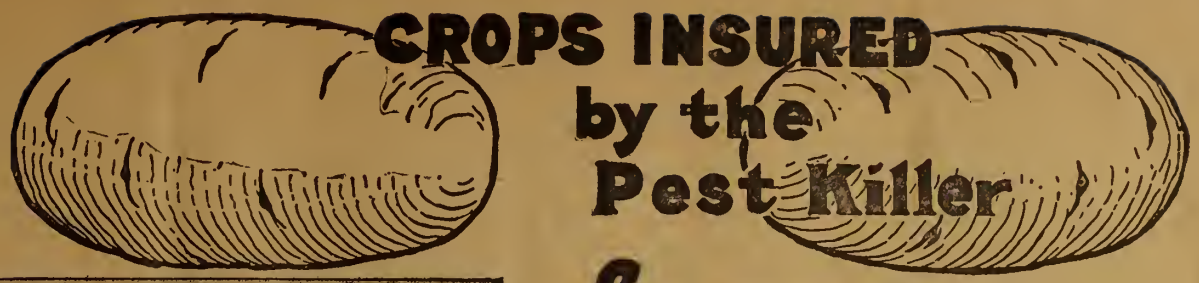
He emphasized the importance of forming seed centres, demand, supply, better grading machinery and the success attained by the St. Rosalind seed centre in the Province of Quebec. This progressive Association owns its own assembling and cleaning centres.

Careful Canadian growers, selectors and graders of seed hold their own favorably with the American growers, and are helping to create a demand in the county to the South for Northern grown seed. Seed growers in the Maritime Provinces can carry on and round out the work so well begun.

Mr. Grant I. Peart of the Markets Division, Ottawa, outlined the policy of his department, which in short is the encouragement of the production of good seed in an economical way, and placing it on the market where it will accomplish the best results.

Hon. J. E. Sinclair of Prince Edward Island, himself a practical farmer, emphasized the importance of good seed to the stock breeder, and urged the necessity of the early establishment of an elevator and grading plant for Island seed grain growers.

Among the other speakers who took part in the deliberations were: Mr. W. W. Fawcett of Sackville; Dr. Gauthier and J. A. Clark of Prince Edward Island and Wallace Rhodenizer of Bridgewater, N. S. The latter gave instances of big potato yields in his county and how they were obtained, but the Reverend Doctor from The Garden of the Gulf could go one better in every case.



YOU CAN get two or three times the crop with the help of a Spramotor, and not only that, but every one will be a better specimen.

This applies to all fruits and vegetables as well as potatoes, and your Spramotor will kill mustard and other weeds, besides spraying on paint and whitewash six times as quick as by brush.

Disease That Works Overtime

Dyspepsia Once Started Never Quits Till Stopped — Dodd's Dyspepsia Tablets the One Way To Help It.

Some diseases have peculiar seasons in which to do their deadly work, but there is one that works all the time, and overtime at that. It is almost needless to say that disease is Indigestion or Dyspepsia.

Once started Dyspepsia never quits till it is stopped, and there is only one way to help it, and that is by using Dodd's Dyspepsia Tablets.

There is abundant proof that Dodd's Dyspepsia Tablets always help Dyspepsia, hundreds of Canadians who speak as does Jos. Zeph. Cote, St. Cyrille de Wendover, Que.:

"I have been cured of Dyspepsia, from which I suffered for years, by your Dodd's Dyspepsia Tablets. I can now eat whatever I like without any bad effects."

Dodd's Dyspepsia Tablets, 50c. a box, or six boxe s for $2.50, at all dealers, or The Dodd's Medicine Co., Limited, Toronto, Ont.

N.S. FRUIT GROWERS 56th ANNUAL

Association is Making a Drive for 500 Members. There should be a big Response

FIVE HUNDRED MEMBERS is the goal fixed by the Nova Scotia Fruit Growers Association in 1920. The annual meeting will be held at Kentville, January 20th, 21st and 22nd, and an excellent program has been arranged for the gathering. All interested in fruit growing are invited to be present. The annual fee is $1 for men and 50 cents for ladies. Since its organization in 1863, the Nova Scotia Fruit Growers Association has done much to advance the interests of horticulturalists. Every person interested in fruit growing should lend support by becoming a member.

The following is the program for the meeting:

TUESDAY AFTERNOON

7.30 o'clock

Opening Prayer.

President's Address—H. S. Shaw, Berwick, N. S.

Address—Mayor James H. Yould, Kentville, N. S.

Address—Hon. J. Everett Kinsman, Centreville, N. S.

Address—Hon. H. H. Wickwire, Kentville, N. S.

Address—Cabot's Quilting for Lining ville, N. S.

Pictures—Bee Culture and Scenes of the Annapolis Valley.

WEDNESDAY MORNING

10.00 o'clock

Election of Officers.

Resolutions and Other Business.

Report of Committees.

Appointing Delegates to Potato Convention, Ottawa.

Address—Orchard Management, Prof. W. S. Blair, Kentville, N. S.

Address—Caot's Quilting for Lining Box Cars, Frank H Gillis, Halifax, N.S.

WEDNESDAY AFTERNOON

2.30 o'clock

Address—General Results from Orchard Spraying and Dusting Experiments, Prof. W. H. Brittain, Truro, N. S.

Address—Cost of Spray Materials, Amount per Acre, Etc., Geo. E. Sanders, Annapolis, N. S.

Discussion—By Prominent Orchardists.

WEDNESDAY EVENING

7.30 o'clock

Address—Recent Experiments of Interest to Nova Scotia Fruit Growers, Prof. W. T. Macoun, Dominion Horticulturist.

Address—Transportation and Co-operation, A. E. McMahon, Kentville, N. S.

Address—Principal Cumming, Truro, N. S.

Pictures—Strand Theatre, 10.30 o'clock.

THURSDAY MORNING

10.00 o'clock

Address—Thinning of Fruit, J. M. Robinson, Kentville, N. S.

Address—Bees, their Value to the Orchard, F. W. Sladen, Dominion Apiarist, Ottawa.

Address—Handling the Nova Scotia Fruit Crop in 1919, G. H. Vroom, Chief Fruit Inspector for Nova Scotia.

THURSDAY AFTERNOON

2.00 o'clock
